Naval Observatory

In addition to the Tracking Stations, the Naval Observatory receives signals during each pass. During a pass, the data processing equipment at the Naval Observatory compares the time of reception of each 78th bit it receives with the even two minutes of Universal Time (UT-2). The times at which satellite time signals are received are then transmitted to the Control Center.

Control Center

The times at which satellite time signals are received are forwarded by the Control Center to the Central Computing Center. The Control Center monitors system operation and acts as a switching central for the routing of data to and from the Central Computing Center.

Central Computing Center

The Central Computing Center continuously accepts data inputs on the satellites from the four Tracking Stations and the Naval Observatory. Periodically, to obtain fixed orbital parameters for a satellite, the Central Computing Center computes an orbit for each satellite that best fits the doppler curves obtained from all Tracking Stations. Then using the computed orbital shape, the central computing center extrapolates the position of the satellite at each even two minutes in universal time for the next 12 to 16 hours, subsequent to data injection. These data together with data on the nominal shape of the orbits of the other three satellites, commands and time correction data for the satellite, and antenna-pointing orders for the Injection Station antennas are supplied to the Injection Stations via the Control Center.

Injection Stations

The Injection Stations, after receiving and verifying the incoming message from the Central Computing Center, store the message until it is needed for transmission to the satellite. As soon as the receiving equipment at the Injection Station receives and locks on the satellite's signals, the Injection Station reads the injection data and commands from storage and transmits them to the satellite. Transmission to the satellite is on a frequency different from those frequencies used by the satellite, and the bit rate is much higher; therefore, injection is completed in a matter of seconds. Once data injection is complete, the satellite continues to transmit at the normal two-minute intervals. Any time corrections for the satellite clock and any commands for the satellite are also

7423

performed during the period of data injection. These precautions ensure that the navigational equipment, which depends on accurate satellite data for determining its positions, is provided the best possible data from each satellite. Any time that the satellite is within radio line of sight of the navigational equipment and has a maximum elevation angle at time of closest approach equal to or greater than 10 degrees and equal to or less than 70 degrees, the satellite's transmission can be used to compute the exact position on earth of the navigational equipment. Satellite passes suitable for use in obtaining a navigation fix will generally occur at least every two hours.

Shipboard Navigation System

The final link in the satellite navigation system is the shipboard navigation system (fig. 15-3). This equipment receives the satellite signals, measures the doppler shift, decodes the information content of the phase modulation, and performs the computations required to determine the ship's position.

The Radio Navigation Set AN/SRN-9 reduces the received satellite signals to a form which is suitable for navigational computations. One of the following three options may be used to perform the computation:

1. General purpose computer—Data must first be processed through a suitable buffer unit which converts the information into the computer format.

162.60

Figure 15-3.—Shipboard navigation system configuration.

2. CP-827 Computer—This special purpose computer is presently being supplied with the AN/SRN-9 Radio Navigation Set and will be discussed later.

3. Hand computation—Using the printed data available from the Control Group printer.

Accuracy Considerations

There are five factors which determine the final accuracy of the navigational fix:

1. Accuracy of satellite orbit determination.
2. Accuracy of satellite orbit prediction for future times.
3. Accuracy of doppler measurements which is a function of the satellite oscillator and the receiving equipment's local oscillator.
4. Effects of ionospheric refraction, which are minimized by the use of a dual frequency system.
5. Accuracy of determination of ship's course and speed. (A 1-knot error in velocity North or South will contribute approximately a 0.2-nautical mile error to the navigational fix; errors in velocity East or West are less serious.)

INTEGRATED DOPPLER NAVIGATION

The navigational fix computed by Radio Navigation Set AN/SRN-9 is based on the shift in frequency (doppler frequency shift) that occurs whenever the relative distance between a transmitter and a receiver changes. Such a change occurs whenever a transmitting satellite passes within radio range of a receiver on earth and is due to the motion of the satellite in its orbit, the motion of the navigator on the surface of the earth, and the rotation of the earth about its axis.

As previously stated, the satellite message describes the orbital position of the satellite every two minutes on the even minute. To obtain a navigational fix, it is necessary only to determine the ship's location relative to the known satellite positions. The Radio Navigation Set AN/SRN-9 employs a so-called integrated doppler measurement for this purpose. In figure 15-4 positions of the satellite in its orbit are shown for times t_1 through t_4. The slant range from ship to satellite is given by S_1 through S_4. The positions of the navigator, P_1, through P_4, refer to the times at which the SRN-9 receiver recognizes the satellite synchronization signal, $t_1 + \Delta t_1$ through $t_4 + \Delta t_4$. Note that the times of reception are slightly

7424

f_o = NOMINAL VALUE OF NAVIGATOR'S REFERENCE FREQUENCY

c = SPEED OF LIGHT

Δ_f = DIFFERENCE BETWEEN NAVIGATOR'S REFERENCE FREQUENCY AND SATELLITE TRANSMISSION FREQUENCY

T = 2 MINUTES (I.E. t_2-t_1, t_3-t_2, ETC.)

λ = LATITUDE

ω = LONGITUDE

t = TIME OF TRANSMISSION OF TIMING MARK

$t+\Delta t$ = TIME OF RECEPTION OF TIMING MARK

N = DOPPLER COUNT

S = SLANT RANGE

$$N_{12} = f_{o/c}\,[S_2(\lambda,\omega)-S_1(\lambda,\omega)] + \Delta f.T$$

$$N_{23} = f_{o/c}\,[S_3(\lambda,\omega)-S_2(\lambda,\omega)] + \Delta f.T$$

$$N_{34} = f_{o/c}\,[S_4(\lambda,\omega)-S_3(\lambda,\omega)] + \Delta f.T$$

162.61

Figure 15-4.—Integrated doppler measurement.

later than the times of transmission due to the radio propagation time over the slant ranges S_1, S_2, S_3, and S_4. Also, since the propagation times Δt_1, Δt_2, Δt_3, and Δt_4, are not equal, the time intervals over which the SRN-9 makes its integral doppler measurements will differ slightly from the exact two-minute value, being somewhat smaller prior to satellite closest approach (while S is decreasing) and somewhat larger after closest approach (while S is increasing). This fact, however, does not affect the result of the measurement because the number of r-f cycles transmitted by the satellite between synchronization signals (exactly

7425

two minutes apart) must necessarily equal the number received by the navigator between receptions of the synchronization signals since no r-f cycles can be "lost" or "gained."

The integral doppler measurements are simply the count N_{12} of the number of doppler cycles received between $t_{1+\Delta}$ t_1 and $t_{2+\Delta}$ t_2, the count N_{23} of the number of doppler cycles between $t_{2+\Delta}$ t_2 and $t_{3+\Delta}$ t_3, and so on for all two-minute intervals during the satellite pass. These counts are a direct measure of the amount by which the slant range from satellite to navigator has changed (S_2-S_1, S_3-S_2, etc.) during the count intervals. This measure is quite accurate since each doppler count added (or subtracted) due to the relative motion means that S has decreased (or increased) by one wavelength. Therefore, one of the required inputs to the fix computation (slant range increment over two-minute intervals) is directly measured by the SRN-9 integral doppler count, suitably scaled as indicated in figure 15-4. Since the satellite positions at t_1 and t_2 are known, the receiver must be on some surface defined by the measured slant range difference between these two points. This surface is a hyperbola of revolution with foci at the known satellite positions. The ship must be located, therefore, somewhere along the curve defined by the intersection of this hyperboloid and the earth's surface. The next doppler count (between t_2 and t_3) will define a second curve, and the intersection of these curves gives the navigational fix.

In actual practice two factors complicate this simple explanation. First, the doppler signal which is counted consists of the doppler frequency plus a fixed, but not very accurately known, bias frequency (Δ f in fig. 15-4). Therefore, a third doppler count is required in order to solve for the three variables—latitude (λ), longitude (ω), and bias frequency (Δ f) as defined in figure 15-4. This means that integral doppler counts for at least three two-minute intervals must be used (and preferably more than three) in order to determine the three unknowns, λ, ω, and Δ f. The second complication is the motions of the ship during the satellite pass. To account for this, the best estimate of a ship's motion must be entered into the navigational computation along with the doppler counts and the satellite message.

The fact that the integral doppler counts N_{12} through N_{34} are directly affected by Δ f, is illustrated in figure 15-5, wherein f_G is the (constant) frequency of the navigator's reference oscillator, f_T is the (constant) frequency of the satellite's transmitter, f_R is the received frequency containing the doppler component, and $\Delta f = f_G - f_T$. The integral doppler counts, N12, etc., are represented by the shaded area, and it will be noted that the shaded area is increasing as we progress in time from $t_{1+\Delta}$ t_1 toward $t_{3+\Delta}$ t_3.

Figure 15-5 illustrates a typical doppler curve of frequency versus time and is an actual plot from a satellite pass. The received frequency (f_R) is higher than the satellite transmission frequency from time $t_1 + \Delta t_1$ to slightly after time $t_3 + \Delta t_3$, to the point where f_R crosses f_T. This portion of the curve represents the received frequency from time of satellite lock on to the point of closest approach. That portion of curve f_R below f_T represents the actual received frequency as the satellite's distance from the receiver is increasing. The point where f_R crosses f_T is point of closest approach. At this time, f_R equals f_T and there is zero doppler.

There is only one Doppler frequency curve for any one position on earth that can be obtained for a given navigational fix by satellite. Figure 15-6 displays the characteristics of Doppler frequency shift for different locations about an arbitrary reference point on earth. Notice that in all cases the received frequency (f_R) is greater than the transmitted frequency (f_T) as the satellite approaches the navigator, in effect "compressing" the radio waves enroute. Notice also that the received frequency equals the transmitted frequency at the point of closest satellite approach, and that the received frequency decreases as the satellite recedes from the navigator, thereby "expanding" the radio waves between them. The four curves of figure 15-6 show the Doppler frequency variations received at selected positions, with respect to the satellite's subtrack. A subtrack is the path traced on the earth by a satellite passing directly overhead. When the navigator is located on the subtrack, the satellite passes directly overhead and the Doppler frequency variation is similar to that shown in figure 15-6, A. An observer north of the navigator would also be on the subtrack and would receive an identical Doppler frequency curve, but at an earlier time if the satellite were moving north to south, and at a later time if the satellite were travelling south to north. An observer to the west or east would record the variation at the same time as

7426

162.62

Figure 15-5.—Doppler frequency variation with time.

the navigator, but with altered shape as shown in figure 15-5,B,C, and D. Figure 15-5,B exhibits the more gradual rate of change of Doppler frequency shift introduced by displacement to either east or west of the subtrack; while the effect of the earth's rotation is added to the curves of figure 15-5, C and D, showing how east and west displacements from the subtrack are distinguished from each other.

Thus, the shape of the received Doppler frequency curve and its time of reception depend on the receiver's position on earth, the satellite's location in space, and the rotation of the earth. If either the receiver's position or the satellite's position is known for the time of reception, the other can be determined from the received Doppler frequency curve.

AN/SRN-9 DESCRIPTION

This section provides a functional block diagram description of the Radio Navigation Set AN/SRN-9. The AN/SRN-9 Radio Navigation Set can be broken down to three major groups; Mast Group, Electronics Group, and Control Group which are treated separately in the following paragraphs.

Mast Group

The Mast Group (fig. 15-7), consists of a vertical whip antenna, upper and lower ground planes, and a housing assembly. The housing assembly contains all the electronic circuits associated with the Mast Group.

The Mast Group receives, separates, and amplifies the two signals from the satellite. The signal flow, in block diagram form, is illustrated in figure 15-8.

The two satellite signals are received by the dual frequency antenna. The antenna (fig. 15-7), is a simple rod of approximately 1/4 wavelength at 150 mc and 3/4 wavelength at 400 mc, mounted above a conical ground plane. A second ground plane consisting of 12 radial rods is located at the base of the Mast Group to isolate the Mast Group from any mounting structure and thus preserve the antenna pattern.

The diplexer (fig. 15-8) separates the combined signal from the antenna into its 150-mc and 400-mc components, each of which is conducted by coaxial cable to its respective preselector (preselective filter). If strong adjacent-channel signals are not anticipated, the output from the diplexer may be inserted directly into

7427

162.63

Figure 15-6.—Doppler frequency response to position changes.

the inputs of the amplifiers, resulting in an improvement in system sensitivity of approximately 3 db. When the preselectors are used, their outputs are connected to the input of the amplifiers. The 400-mc preselector provides discrimination against undesired off-frequency signals.

The 400-mc filter is connected between the second and third stages of the 400-mc amplifiers. Its function is to maintain a relatively constant center frequency and bandwidth characteristics of the amplifier with gain variations from Automatic Gain Control (AGC).

The 150-mc preselector and 150 mc filter are identical units. The preselector provides discrimination against undesired off-frequency signals, while the filter provides a constant bandwidth for the 150-mc amplifier regardless of the AGC voltage applied.

The 400-mc amplifier consists of eight r-f stages and three d-c amplifier stages, which provide AGC and temperature compensation. The amplifier exhibits a nominal gain of 70 db with a 50 db AGC range.

The 150-mc amplifier consists of five grounded-emitter, neutralized transistor stages and three d-c amplifier stages which provide AGC and temperature compensation. The amplifier exhibits a nominal gain of 70 db with a 55 db AGC range.

Electronics Group

The major elements of the Electronics Group (fig. 15-9) are the receiver unit, the data

7428

162.64

Figure 15-7.--Mast group.

processor unit, the power supply unit, and the oscillator. Before describing these units it will be necessary to become familiar with the received signal and message organization.

Data is received from the satellite in the form of phase modulation on the carrier

162.65

Figure 15-8.--Mast group, block diagram.

162.66

Figure 15-9.--Electronics group.

7429

frequency. The data is coded in binary form (fig. 15-10). The basic encoding unit is called a doublet and consists of two intervals of opposite phase shift followed by two intervals of no phase shift. Two successive doublets are required to define a binary bit.

The Radio Navigation Set AN/SRN-9 must make the correct association between adjacent doublets to translate the signal modulation into "logical bits." The process of determining this correct association is called "bit synchronization."

The satellite message received by the Radio Navigation Set AN/SRN-9 in a two-minute interval consists of 6103 binary bits organized into 156 words of 39 bits each plus a 19-bit word.

The last 25 bits of word 2 are a synchronizing pattern consisting of 1 zero, 23 ones, and another zero (0111111111111111111111110). The beginning of the first bit of word 3 is the two-minute time mark. Transmission of the message from the satellite is precisely controlled so that these two-minute time marks are normally transmitted within 1 millisecond of even integar two-minute times as determined by the Naval Observatory. Word 3 can be heard in the head set as a 400-cps tone. The beginning of this so-called "beep" word may be used as a time mark to set the navigator's chronometer.

Only every sixth word starting with word 8 is required for navigation, thus words 8, 14, 20, 26, 32, etc. are all that will be required. Also the Radio Navigation Set AN/SRN-9 uses only the data contained in the first 32 bits of each word. These are transmitted as eight Binary Coded Decimal Excess Three (BCDXS3) digits. For example, the number 5 would normally appear in binary as 00000101. In BCDXS3 it would appear as 00001000, that is, each number is transmitted three higher than its actual value.

The Radio Navigation Set AN/SRN-9 recovers and records doppler data, satellite data, and timing information from the satellite signal. The higher frequency signal transmitted by the satellite is 400 mc - Δ_H, where $\Delta_H \cong 32$ kc since the frequency is offset 80 ppm. (The low channel likewise 150 mc - $_L$, where $\Delta_L \cong 12$ kc.) This signal is shifted in frequency by d_H due to doppler effect and ξ_H due to ionosperhic refraction. The range of d_H is between 8 kc and that of ξ_H is between $\pm$ 3 cps. The signals as received are 400 mc $-\Delta_H + d_H + \xi_H$ and 150 mc $-\Delta_L + d_L$ and $+\Delta_L$. Figure 15-11 illustrates the association of these frequencies on a typical Doppler frequency curve.

The receiver is the middle drawer (fig. 15-9) of the Electronics Group. The received signals are fed from the Mast Group as two

162.67

Figure 15-10.—Modulation characteristics in binary coded form.

162.68

Figure 15-11.—Doppler frequency curve.

7420

separate signals and consist of 400 mc - $\Delta H + d_H + \xi_H$ and 150 mc - $\Delta_L + d_L + \xi L$, as shown in fig. 15-12.

The 400-mc signed is fed to the 5-mc i-f amplifier assembly, which consists of a 400-mc mixer and four amplifier stages. The mixer subtracts the 400-mc incoming signal from a 405-mc local oscillator (LO) signal to produce an i-f frequency of 5 mc.

The 5-mc i-f amplifier has an overall gain of approximately 100 db and a bandwidth of 3 kc with AGC being applied to the first two stages.

The 5-mc phase comparator assembly compares the i-f amplifier output with frequency stable quadrature reference signals. The phase comparator circuit is a fullwave, or balanced type, which means there is no output of either the i-f input signal or reference signal but only the sum and difference frequencies of the two inputs. The phase comparator has two outputs, one proportional to the sine and the other to the cosine of the phase difference between the i-f signal and the reference signal.

The 5-mc buffer assembly consists of three identical buffers and a tripler. The buffers supply 5-mc signals to the 5-mc phase comparator, the 1.875-mc converter, and the tripler.

The 16.8-mc voltage-controlled oscillator (VCO) generates the basic frequency from which the r-f mixer reference frequency (405 mc) is derived.

The output of the VCO (16.8 mc) is fed to the 16/101-mc multiplier assembly which synthesizes the signals to drive the mixer section of the i-f amplifier and the 101/404-mc multiplier.

The 101/404-mc multiplier provides reference signals for the mixer section of the 5-mc i-f amplifier and the audio mixer.

PHASE-LOCK TRACKING.—Tracking of the satellite signal is accomplished by the phase-lock loop (fig. 15-13) which consists of the 5-mc mixer and i-f amplifier assembly, the 5-mc phase comparator, a phase loop control network, the VCO, the 16/101-mc multiplier, and the 101/404-mc multiplier. The loop operates to maintain the 101/404-mc multiplier output frequency at exactly 5 mc greater than the input signal from the satellite or 400 mc - $\Delta_H + d_H + \xi_H$ +5 mc. Once lock-on of the satellite signal is accomplished the phase-lock loop will automatically track the satellite as the output of the 101/404-mc multiplier will

162.70

Figure 15-13.—Phase-locked loop block diagram.

vary in frequency as the satellite signal varies in frequency.

This is possible since the VCO output varies according to the magnitude and polarity of its d-c input, which in turn depends upon the satellite signal and the local reference signal. The phase-lock loop must be in equilibrium, (lock-on has been achieved and the satellite is being tracked), before any useful data can be received. The 150-mc channel does not have the capability of tracking the satellite and is used only for refraction correction, therefore this channel cannot perform its function unless the 400-mc channel is operating properly. In other words the 150-mc channel is slaved to the 400-mc channel. This can be seen by referring to figure 15-12 where it will be noted that one of the inputs to the 1.875-mc i-f amplifier assembly comes from the 16/101-mc multiplier assembly the value of which is determined by the output from the VCO. Both the 16/101-mc multiplier and VCO are in the phase-lock loop as shown in figure 15-13.

5-MC OSCILLATOR.—The 5-mc oscillator (fig. 15-12) is a modified Pierce circuit with the crystal operating near its series resonant frequency of 5 mc.

The frequency stability for short term periods is 4 to 8 parts in 10^{11} and is to 6 parts in 10^{10} per day. The stability that we are interested in is the short term period; the stability during the actual tracking of a satellite. This is apparent when it is recalled that the navigation fix is based upon the actual doppler count for two-minute intervals.

The oscillator must remain on at all times in order to maintain its stability. Provisions have been made for automatic switch to battery power in case of normal power failure. The nickel-cadium battery is good for four hours of operation. Following initial power turn-on or any temporary power interruption, the 5 mc oscillator requires a warmup period for the frequency to stabilize sufficiently for high-accuracy navigation. This warmup period is approximately 10H hours, up to a maximum of 72 hours, where H is the length of power interruption in hours.

The importance of the stability of this 5 mc reference must be stressed. It may be well to remember that in case of failure of this oscillator and a ready spare is not available, a good substitute would be the AN/URQ-9 (described in chapter 3 of this manual), provided sufficient warmup time is allowed before any navigation fix is attempted.

DOPPLER RECONSTRUCTION.—The output of the 5-mc oscillator is fed to a 5-mc buffer stage (fig. 15-12) where two separate amplifiers are used to provide inputs to the 5-mc phase comparator and the 1.875-mc converter. Also included in the 5-mc buffer assembly is a

7432

tripler where the 5-mc signal is multiplied to produce an output of 15 mc. The 15 mc-signal is fed to the 5/405-mc multiplier.

The output of the 5/405-mc multiplier is fed to the Audio Mixer which combines this input with the 404.9-mc signal from the phase-locked loop to obtain a nominal 32-kc signal containing the desired doppler frequency. The actual frequency present at the output of the audio mixer is approximately 32 kc and is made up of ΔH-dH-ξH as indicated in figure 15-12.

REFRACTION CORRECTION.—The purpose of refraction correction is to eliminate ξ H. This is accomplished because ξ is inversely proportional to transmitted frequency, whereas Δ and d are directly proportional to frequency. A definite relationship exists between these frequencies in that 150 mc is to 400 mc as 3 is to 8.

The 1.875-mc i-f amplifier (fig. 15-12) has as one of its inputs the low frequency signal (150 mc $-\Delta L + dL + \xi L$) with the other input being 50.6 mc derived from the phase-lock loop.

The 1.875-mc signal in the converter is obtained by multiplying the 5-mc signal from the 5-mc buffer by 3/8. This is done by dividing by 8 and then multiplying by 3. The 1.875-mc output is phase locked to the 5-mc input.

The outputs of the 1.875-mc phase comparator are called "Refraction Correction A" and "Refraction Correction B."

The Doublet Phase Comparator (DPC), (fig. 15-12), is a subsystem within the doublet-rate, phase-tracking loop. The DPC compares the phase of the local doublet rate with the satellite doublet rate and provides phase commands to the digital clock in the data processor when the phase error exceeds a certain threshold. The output of the DPC is the same wave shape as the doublet-rate flip-flop in the data processor except it is shifted 90 degrees in phase with respect to it. Phase synchronism is necessary to decode the incoming data and to define the doppler period's end points. When the output exceeds a certain positive value, than an advance or add command is given. If it is more negative than a certain value, a retard or subtract command is given.

The Phase Modulation Decoder takes phase-modulated doublet data from the doublet phase comparator, synchronously detects it, and places it in a binary format compatible with the digital section. Synchronous detection followed by an integration with end-of-bit sampling is used to afford immunity from noise errors. The digital section provides the properly timed gating signals for synchronous decoding.

DATA PROCESSOR UNIT.—The data processor unit (DPU), is the top drawer (fig. 15-9) of the Electronics Group. The DPU organizes the timing signals, satellite orbit parameters, and doppler counts derived from the satellite signals by the previously described sections of the Electronics Group and outputs this information to the computer and to the Control Group for printout. For discussion purposes of the DPU, a binary "one" is defined to be -9 ± 3 volts and binary "zero" to be 0 ± 0.2 volt. A pulse is defined to be a rapid change of state from "one" to "zero" (6 volts/nano sec slope).

Standard medium speed digital circuity is employed in the DPU with germanium transistors and diodes used throughout. All circuitry is standard and will be discussed in block diagram form, by referring to figure 15-14.

The 104-kc oscillator is a two-stage transistor amplifier with feedback through a quartz crystal mounted in an external oven at a temperature of $75 \pm 2°C$. The amplifier gain is sufficiently high so that the output transistor is alternately saturated and cut off, providing a squarewave output. The output of the 104-kc crystal oscillator is applied to FF01. Flip-flops 01-11 are binary dividers reducing the 104 kc to bit rate. FF10 is the doublet-rate flip-flop with an output of 101.7 cps or a period of about 10 msec. FF11 is the bit-rate flip-flop with an output of 50 cps or a period of about 20 msec.

One of the outputs of the bit-rate flip-flop (FF11) is applied to the digital clock which is made up of FF12-25 which performs the function of counting message bits and words. It consists of a "radix-39 counter", a "radix-6 counter", and a "radix-27 counter".

The radix of a numbering system is equal to the sum of the different characters which are necessary to indicate all the various magnitudes. As used here it simply means the number of bits that are to be counted before the counter is reset to zero state. In other words the "radix-39" counter will count 39 bits, the number of bits in each satellite word, and will then reset to zero to begin counting the bits of the next word. The "radix-6" counter will count the number of words so that only every sixth word is used. The "radix-27" counter counts the number of words that are

7433

162.71

Figure 15-14.—Simplified block diagram of data processor unit.

used, in each two-minute message. As previously mentioned, only every sixth word is required for a navigational fix, beginning with word 8, with the sequence being 14, 20, 26, 32, etc. to word 152. The radix-27 counter then counts the number of words used, and the entire digital clock is reset to zero before the next two-minute message.

Flip-flops 12-17 form the radix-39 counter. They perform a straight binary count until the 39th state, at which time flip-flops 12, 15, and 16 are set to "one."

One count per word enters FF18 via NO8B. Flip-flops 18, 19, and 20 form the radix-6 feedback counter. When FF20 toggles from "zero" to "one," feedback sets FF19 to "one", thus six is as high as the radix-6 counter can count.

Flip-flops 21-25 form a radix-27 counter. Feedback occurs to set flip-flops 21 and 23 to "one" when FF25 toggles from "zero" to "one."

When the radix-27 counter reaches the 26th state, after six 39-bit words, FF21 is toggled from "zero" to "one" and flip-flops 18, 19, and 20 are immediately set to "one." This prepares the clock to count the last word of 19 bits of the satellite message. When the radix-39 counter reaches the 19th stage, all flip-flops of the radix-39 counter are set to "one". The beginning of the next bit counted by FF11 toggles flip-flops 12-25 to "zero," indicating the beginning of the next two-minute message.

Before any counting is to be done, doublet rate synchronization must be made. This is accomplished by the Doublet Phase Control Assembly. If the DPC in the receiver determines that the doublet-rate flip-flop (FF10) is lagging in phase, pulses are added to FF01. If FF10 is leading in phase, pulses are subtracted from FF01, until the "local doublet-rate" is in sync with the satellite doublet rate.

7434

Doublet demodulation by the phase modulation decoder in the receiver occurs after doublet rate synchronization. The phase modulation decoder output is applied to the shift register (FF33-56). The serial shift signal enters each doublet into FF33 and shifts the previously entered doublet into FF34. If the doublets in flip-flops 33 and 34 are different, a count pulse is sent to the add/subtract unit which is comprised of flip-flop 49-52 and used as an up-down counter. This count occurs when the satellite bit rate phase to which FF11 must be synchronized is in the "one" state. Once every 39 bits when FF17 toggles from "one" to "zero," flip-flops 49-52 are set to 0111 state (most significant bit given first). Whenever the flip-flops count from 0111 to 1111, a pulse is sent to assure that FF11 is in the "one" state. When FF11 is in the "one" state and FF49 switches from "one" to "zero," FF50 is toggled; and the counter is adding. When FF49 switches from "zero" to "one," FF50 is toggled and the flip-flops are subtracting.

If counts occur when FF11 is in the "one" state, they are added to the preset value of 0111. If counts occur during the "zero" state of FF11, they are subtracted from 0111. In either case eight counts in either direction will drive 0111 to 1111.

After bit synchronization, full bits are demodulated by the phase modulation decoder and shifted through the entire shift register and FF28.

Gate N42 is a 26 input NOR gate connected to flip-flops 33-56 and 28 so that when they contain the 25-bit synchronization pattern (01111111111111111111111110) the gate will be satisfied. The 26th input to N42 is the 26th bit input signal, which can be used to prevent the data processor unit (DPU) from obtaining message synchronization.

When the synchronization pattern is recognized by N42, FF97 is set to "one." When FF97 is set to "one," the following changes take place;

(1) Flip-flops 12-17 are set to the "one state
(2) Count pulses can enter FF18.
(3) No shift pulses can enter FF28.
(4) Message synchronization occurs.

When message synchronization occurs, the last bit of the synchronization pattern enters the shift register. Serial shift pulses occur about 5 milliseconds before each count pulse from FF11. Thus, the count pulse immediately following pattern recognition represents the satellite two-minute mark, or the beginning of word 3. After message synchronization the DPU begins to process data.

The 400-mc doppler signal from the receiver unit is converted to a square wave by a Schmitt Trigger and applied to the doppler counter. Flip-flops 68-95, which form the doppler counter, are divided into seven groups of four flip-flops each. Each group is a radix-10 feedback counter so that the doppler count is accumulated in decimal. The seven decades count in Binary Coded Decimal Excess Three (BCDXS3). Bits enter the decade serially from left to right so are in reverse order. As an example, when flip-flops 72-75 reach the 1100 (9) state the individual flip-flop states would appear as shown in figure 15-15, A.

Since this counter is a radix-10 counter the next pulse toggles FF72 and FF73 to "one" and resets FF74 to "zero." This toggles FF75 to "zero," sending a count pulse to the next decade. The state of the counter would then be as shown in figure 15-15. B. or in the "zero" state, ready for the next count. Figure 15-15, C shows a truth table for each of the 10 states of the radix-10 counter.

Every two minutes under control of the digital clock, the doppler counter transfers its contents to the shift register and resets to "zero." Preparation begins during states 26 and 27 of the digital clock radix-27 counter and it is significant that this reset operation is controlled by the incoming doppler frequency itself. In this

way no doppler count can be lost during the transfer and reset operation.

"Refraction Correction A" and "Refraction Correction B" signals are applied to two Schmitt Triggers which will be referred to as ST1 and ST2, respectively. These two signals come from the 1.875-mc phase comparator assembly in the receiver and are in phase quadrature, with a frequency 55/24 times the desired refraction correction rate.

The output of a Schmitt Trigger changes state rapidly each time its input crosses 0 volts. Because noise often accompanies the refraction correction signals as the signal voltage approaches zero, the signal plus noise voltage may cross zero several times. However, only one refraction correction count must occur.

Two outputs from each of the Schmitt Triggers are in phase opposition, so if the input of ST1 crosses zero volts in either direction it will set a flip-flop to "zero". Similarly, ST2 sets the same flip-flop to "one." Thus, the first count pulse from ST2 sets the flip-flop to "one," preventing a count until ST1 resets the flip-flop to "zero." In this way only one count pulse from the Refraction Correction B signal can enter the Refraction Counter until the Refraction Correction A signal again crosses through zero.

Flip-flops 60-55 (fig. 15-14) form a radix-55 feedback counter. The feedback sets flip-flops 60 and 63 to "one" when FF65 toggles from "zero" to "one." With a total of 55 pulses to FF60, the output of the radix-55 counter will be 24 pulses.

This output is taken from the set side of FF60. By utilizing the feedback, FF60 is in the "one" stage 24 times out of 55 input pulses. These pulses are applied to the refraction correction control and during this time are added to or subtracted from the doppler count in the doppler counter.

The primary data output from the DPU (Data Processor Unit) is from flip-flops 29 to 32 (output register). All doppler count and satellite message data is shifted, four bits at a time, into these output flip-flops.

In preparation for the doppler count transfer, the shift register and flip-flops 29 to 32 are filled with binary "zeros". Because the shift register is filled with "zeros," only the binary "ones" need to be transferred from the doppler counter. At time of transfer the doppler count in flip-flops 68 to 91 is put into the shift register while the count in flip-flops 92 to 95 is transferred directly to the output register. This transfer takes place just after the digital clock resets to all "zeros" at which time the two-minute mark timing signal is outputed. The shift register is delayed for four-bit times allowing time for the doppler count digits transferred directly to the output register to be decoded and entered into the printer.

After the four-bit delay the contents of flip-flops 33 to 56 are transferred into the output register and the serial shift pulses begin again. After each set of four bits has been shifted into flip-flops 33 to 56, it is then transferred out. When this process is completed satellite data is again allowed to enter the shift register.

Every bit received from the satellite is entered into the shift register except during the preparation and processing of doppler count data. The output transfers this data into the output register four bits at a time as previously discussed.

The BCDXS3 decoder module is a diode matrix which converts binary-coded inputs to decimal outputs. Certain other signals are provided as outputs of the DPU for use by a navigational computer, paper tape punch, or other device. These are end-of-word, digit rate, bit rate, bit sync signal, two-minute mark, and serial data.

7436

Control Group

The Control Group (fig. 15-16) contains a number of interacting circuits and performs switching functions. The entire navigational fix can be monitored and controlled from the Control Group and associated computer.

Positions 1, 2, and 3 of the ten-position main control switch (S01) are used to perform a test of the power supply voltages; +12 volts, -12 volts, and -24 volts, respectively. If these voltages are correct, 50 microamps will flow through the 100-microamp meter, M01, and the needle will point to the green line at midscale.

Position 4 of switch S01 puts the navigational set into the search mode. Circuits involved in this operation are:

(1) Frequency search control
(2) Audio monitor
(3) Frequency monitor
(4) Doppler acquisition light

To tune the set, the operator uses two single-pole double-throw frequency search switches which are located under the FREQUENCY SEARCH bar. When the right side of the search bar is depressed, the set is tuned towards a higher doppler frequency by connecting -12 volts to the "manual tune" function. When the left side of the bar is depressed, 12 volts are connected to the "manual tune" function and the set is tuned towards a lower doppler frequency. When neither side of the bar is depressed, a small positive bias is applied to the manual tune" function. This small bias tunes the receiver to a doppler frequency of approximately 26 kc, which is near the frequency at which a satellite signal should first appear. The "manual tune" function circuitry is external to the control group and consists of resistors and capacitors which are used primarily to develop different time constants for the tuning bias which is then applied across the VCO voltage-variable capacitor.

162.73

Figure 15-16.—Control group.

A jack on the left side of the Control Group (not shown) provides an audio monitor signal to high-impedance headphones. This signal is the output of the 5-mc phase comparator monitored through a 100K ohm resistor. When the set is tuned near a satellite signal, the difference frequency may be heard in the headphones. The operator then tunes the frequency until a zero beat, or frequency null, is heard, indicating the receiver is in phase with the satellite signal.

Meter M01 has two scales as illustrated in figure 15-16. In the search mode the top scale of M01 displays the doppler frequency to which the navigation set is tuned. By this means the operator is guided to search for the satellite signal only in the frequency region where it is expected. The scale runs from 22 kc to 42 kc, which is wide enough to accomodate all possible satellite frequencies.

The Doppler ACQ (Acquisition) Light is another aid to the operator in locking on a satellite signal and is located in the upper right-hand corner of the Control Group panel. When the receiver is tuned to within approximately 30 cps of the satellite signal, the light begins to flash at that difference frequency. Thus, the light provides a visual tuning indication to supplement the audio monitor signal.

In the Pause Mode (Main Control switch S01 in position 5) the phase-lock loop in the DPU and Receiver is closed and the frequency search bar will have no effect. The signals reaching the Doppler ACQ light change from 30 cps to 1 cps. Because this signal is derived from the 5-mc phase comparator output, the light comes full on and stops flashing if the receiver is phase-locked to a satellite signal.

When the Main Control Switch is in position 5 (Pause Mode), the meter displays a measure of the phase error between the double rate flip-flop in the data processor unit and the doublet modulation rate received from the satellite. When the data processor unit achieves

7437

phase-lock, the meter needle will vary about the green center mark.

Positions 6-10 of the Main Control Switch (S01) comprise the track mode. In this mode the receiver tracks the satellite signal, and the data processor processes navigational data. These functions are monitored by the meter and by observing the output of the printer. While the receiver remains locked to the satellite signal, the only control functions are to select whether or not to use the refraction correction signals and, if necessary, to reject a data processor unit synchronization.

The Refraction Rate Light and Switch (fig. 15-16) gets its input from the 1.875-mc phase comparator and is the Refraction Correction B signal. It is a 3-volt peak-to-peak sinusoid with a frequency 55/24 times the refraction error frequency at 400 mc. Thus, the REFRACT CORR RATE light should flash at a rate seldom faster than 10 cps if the 150 mc satellite signal is being received properly.

The refraction control switch (fig. 15-16), allows the operator to select whether or not the data processor unit performs the refraction correction operation. If the REFRACT CORR RATE light is flashing in an erratic manner, it indicates that only noise is being received through the refraction channel, and the refraction control switch should be turned off.

When the Main Control Switch is advanced beyond position 5, the data processor unit is taken out of the high-speed bit track mode, and the "start bit sync" signal allows the data processor unit to achieve a bit synchronization. When this occurs, the DIGIT light (fig. 15-16), goes on. This whole process normally occurs within seconds of advancing S01 to the track mode.

Within two minutes after the DIGIT light comes on, the data processor unit will receive from the satellite a synchronization code. If the code is recognized, the data processor unit will achieve message synchronization and begin to process data. The MESSAGE light (fig. 15-16) will come on, and the printer will begin to print data.

In position 6 and 7 of S01, the two AGC voltages in the receiver are monitored. Position 6 is for the 400 mc AGC and position 7 for the 150-mc AGC. In each case the actual AGC voltages are monitored through 100K ohm resistors located in the receiver. Thus, full-scale deflection represents 10 volts of AGC, on the lower scale of meter M01.

Another monitor function of the meter is the acquisition correlation function. This is the output of the 5-mc phase comparator monitored through a 28.7K ohm resistor. When this signal is at the correct value of +15 volts d-c, the meter will read center scale at the green line. The 400-mc AGC circuit is adjusted to maintain this condition.

DIGITAL COMPUTER CP-827/SRN-9

The navigation system measurements consist of three successive baselines. The satellite message is continuously transmitted during two-minute time periods, each message starting precisely on the even minute mark. A minimum of six full minutes, or three complete satellite messages, is required to calculate these baselines. Additional periods of received satellite transmission will increase the accuracy of these computations. After measuring the doppler shift and decoding the information content of the phase modulation, the computation may be performed in one of several methods.

Hand computation may be made to obtain a position fix, although the complexity of such calculations leads to hours of computational time and an almost certain probability of human error.

A general-purpose computer may be used, although a buffer unit is necessary to process and convert information into the appropriate computer format. The availability and the time sharing aspects of a general-purpose computer, along with the adaptive buffer unit requirement, make this a less desirable choice.

A special-purpose computer, designed specifically to operate with the AN/SRN-9 Navigation Set, can accept data on the format of the received signal. Such a computer must be able to store the results from a single satellite pass, and accept ship's information of estimated longitude, latitude, velocity north, and velocity east. It then must use the satellite and ship's position data to compute the ship's position fix in longitude, latitude, and coincident time. To assure the continuity of the satellite data, the special purpose computer should be able to sense any loss of signal in the lock circuits of the receiver and, when a loss of signal in these circuits is detected, reject information for the two-minute transmission interval as invalid.

The CP-827/SRN-9 is designed as a low cost computer, requiring a minimum of space, and permitting rapid calculation of a position fix to

7438

meet the immediate needs of the Navy Navigation Satellite System.

In most cases, this computer will not render a "wrong" fix; when a malfunction is present, the computer will not progress through its sequence of operations, whether in response to taped program commands or to operator-controlled commands. Although the same basic circuits are used to execute these operations, an early identification of a source of trouble by isolating a malfunction to a distinct mode of operation permits a more rapid assessment of difficulty by the troubleshooter. To this end, a Test Device is furnished with each computer to give visual display of the binary content of all computer registers by means of a panel of lights in marked groupings.

The satellite message received during a satellite pass is cabled directly into the computer memory to a preprogrammed storage location. A taped program reduces the satellite data to a form which, when manual entry of ship's data has been added, will compute a position fix in a matter of seconds.

The final computations, as well as certain interim data, are printed out on the paper tape of the receiver control group printer. The fix is printed in decimal figures of longitude, latitude, time, and offset frequency.

Equipment Description

The CP-827 is a self-contained computer with three slide mounted drawers. Figure 15-17 shows the external view of the cabinet, its controls, switches, lights, and the tape feed and spools.

The computer consists of four major assemblies; Drawer I, Drawer II, Drawer III, and a Rear Door Assembly. The three drawers have front-mounted handles for their access and removal for maintenance.

Drawer I, the top drawer (fig. 15-18), has a blank front panel. Internally, the drawer is comprised of three rows of printed circuit board multipin connectors. Each row can accommodate up to 27 printed circuit logic cards.

Drawer II is the middle drawer of the cabinet. Most of the controls and indicators of the computer are mounted on the front panel of this drawer (fig. 15-19). An eight-position QUADRANT SELECT rotary switch allows selection of one of four quadrants in each of two planes of the core memory. A ten-position DIGIT SELECT rotary switch permits selection of any digit from 0 through 9. Four incandescent lamps monitor the outputs of the manual entry flip-flops, (W01, W02, W03, and W04), to give visual indication of the sequence of operator's data entry into the computer. Five pushbutton switches control the STEP Y, TRANSFER, PRINT, RESET, and START functions. A single-pole double-throw READ-STORE switch allows either readout of memory or storage of information. The AC POWER ON micro-switch, when depressed, gives an indication that power is being applied to the computer. The ENTER DIGIT microswitch permits entry of the digit selected by the rotary DIGIT SELECT switch, and gives indication that the digit has been entered. The J7 ON-OFF is a two-position microswitch for turning on and off the J7 operational code, which controls whether instruction is to come from tape or from the stored program. The lighted portion of the switch indicates the on or off position. This switch should be left in the position where the ON or OFF condition may be controlled by computer operation.

Drawer II is almost identical to Drawer I in internal construction, with three rows of printed circuit board connectors, each row accumulating up to 27 cards.

Drawer III (fig. 15-20), the bottom drawer of the cabinet, contains the heavier computer components, such as the power supply and tape reader assembly. The tape reader is mounted on the front of the drawer. The stacked power supply inside the drawer furnishes regulated d-c voltages of + 12, +19, -6, -8, -12, -19, and an unregulated +18 volts d-c. Potentiometers are provided for each of the individual power supplies and are adjustable over ±10% range. A zero to 25 VDC voltmeter and a rotary selector switch are mounted inside the drawer to monitor each of the power supply outputs. In the rear of this drawer is a 115 VAC, 50/60-cycle single-phase blower motor. Input line voltage to the computer is 115±10 volts, single-phase, 60 cps power.

The Rear Door Assembly (fig. 15-21), has a four-part receptacle for the cabling harness of the test device. A horizontal multipin connector underneath this harness is for receiver-computer hookup. The blower exit vent is at the bottom of the assembly.

Printed Circuit Logic Cards

The cards used in the drawer of the computer are printed circuit boards with all circuit

7439

Figure 15-17.—Digital computer CP-827/SRN-9.

162.74

boards having the same card, or part number, being interchangeable. However, certain cards have potentiometer adjustments which may require realignment if they are interchanged.

Silicon semiconductor components are used on all cards. To achieve a minimal noise level on the d-c power distribution lines, the power lines on each card are bypassed with individual capacitors.

The thirteen types of cards in the computer comprise the modular circuitry to perform all of the operational commands by the three types of input (receiver signals, taped instructions, or manual entries).

Tape Reader

The tape reader mounted on the front of Drawer III (fig. 15-17), is a Rheem Model RRS-102 Reader-Spooler combination. It uses an 8-channel punched tape with a reading speed of approximately 10 inches per second. Operating as the input medium, the function of the tape reader is to convert information from its

7440

162.75

Figure 15-18.—Drawer I, top view, showing logic cards and multipin connectors.

perforated form to electronic signals. As the tape passes under the reading lamp, the holes are recognized by means of photoelectric cells. Each cell is gated with certain logic circuits amplified, and sent to the output receptacle for external routing. The switches on the panel of the tape reader consist of two toggle switches, for power ON-OFF and tape RUN and LOAD conditions, and a pushbutton for the rewind condition of the tape spool.

The light source is a horizontally mounted cartridge lamp with an average life of 4,000 hours. Care must be taken to properly focus the lamp and to ensure that no obstructions, such as dirt, incomplete tape perforations, etc., cover the photocell block apertures.

Receiver Data

The satellite data received during a satellite pass is fed directly into the computer memory to preprogrammed storage locations. The computer automatically interrogates the lock circuits of the receiver during this time and rejects as invalid any message interrupted by a loss of lock in the track. If a sequence of three, full two-minute satellite messages, is not received during a single satellite pass, the computer cannot compute a fix, and the printout will indicate (prior to manual entry of ship's data) that no fix is possible.

Satellite data is transmitted in BCDXS3 format. Any time that the printer of the control group is activated, the computer must operate through the decoder matrix of the receiver. Thus, all data injected into the computer via the receiver must also be in this format. As a 32 bit word is injected from the receiver, the computer is sequenced to accept each four bit series and shift its position to accept the next four bits. All computer data are in this serial binary form, with all numbers having a magnitude less than unity. The binary point is located between the 31st bit and the sign bit, which is in the 32nd position or the left-hand end of the printout. All numbers are stored as absolute value plus the sign bit.

162.76

Figure 15-19.—Drawer II, front view, showing control panel.

7441

162.77

Figure 15-20.—Drawer III, open view, showing interior tape reader and power supply sections.

Satellite data are arranged with the least significant bit in position 1 of the printout, or the right-hand end of the word. The receiver lines feeding the computer are arranged to inject each series of data correctly into bit positions with the most significant bit in position four, and then these are end-around shifted for the computer to accept the next four bits.

The conversion from BCDXS3 is made in the computer prior to the arithmetic operations to simplify the logic. However, output must be reconverted for printing, since the printer must again operate through the receiver's decoder matrix. The Z register, through which all data must pass either entering or leaving the computer, will therefore display its content in XS3 format on the Tester panel lights prior to printing. Likewise, manual entries made in decimal form from the computer panel will be displayed in XS3 form on the (Z-register) Tester lights, although the printout will be in the same decimal form as used for entering the digits.

Core Memory

The computer utilizes two identical ferrite core memories with storage capacities of 128 words of 32 bits each. Each memory consists of the ferrite storage cores arranged in a matrix which is subdivided into four quadrants of 32 X 32 bits. The cores are threaded by three wires to give an X drive, a Y drive, and a bias-digit drive. Each quadrant also has its own sense line feeding a single sense amplifier. The 32 X and the 32 Y drive lines pass through each of the four quadrants of a memory plane. For any given memory cycle, one of the four quadrant lines will be true while the other three are false. During this time, the cores of the three quadrants not selected receive bias current, while the selected quadrant cores receive no bias current. After application of bias current, drive current is applied to one of the X drive lines, in opposition to the bias current. The Y drive current is then applied and only the core at the intersection of the X and Y drive lines in the

7442

162.78

Figure 15-21.—Rear door assembly showing connectors, cooling fan, and terminal board (with cover removed).

selected quadrant receives full current and is switched.

The current steering switch techniques employed provide simplicity for X and Y drive selection and are designed to minimize dissipation in the current stabilization circuits and to provide greater timing tolerance. Sense signals of approximately 45 millivolts occur for each one bit output. A memory cycle consists of two beats, a read or clear and a restore or write beat. Each beat requires 4 microseconds, providing memory cycles of 8 microseconds each.

Whenever the content of a memory cell is scanned, the contents are read without changing the values within the cell.

Instruction Codes

Instruction codes to program the computer may be generated either from the punched tape or from the internally stored program of the memory. Operation from the control panel by the operator can drive words into memory storage, transfer words from memory and obtain a printout. Whether the taped instructions are controlling the operation of the computer, or whether the manual controls are being used to enter data into the computer, the reset button of the computer must be pushed to generate a signal causing the proper sequence and logics to reset and wait for further instructions.

The start button then shifts the computer to a position where it awaits taped instruction. Four characters on the 8-channel tape define a 32 bit instruction. The first 8 bits of the instruction are used for the operation code. The second, third, and fourth groups of 8 bits each are used for the A, B, and C operands, since the CP-827 uses three address computer logic. The timing is based on the use of a stored program, and the variations of time with different instructions are due to the difference in time required for address decoding, according to the position in the memory which is being addressed. By placing the primary working storage in the small addresses of temporary storage registers, it is possible to keep the timing at a minimum for the bulk of a computing program. For this reason, eight special registers are set aside in the memory for use in performing the various arithmetic and logical operations, and to provide temporary storage of instructions.

Block Description

The organization of the computer is shown in block diagram form in fig. 15-22, and the front panel of the Test Device is shown in fig. 15-23.

Three types of input are shown in blocks A, B, and C, (fig. 15-22). These are the manual data entered at the control panel, the taped instructions at the tape reader, and the satellite data via the decoder matrix of the receiver. The output to the printer, Block E, is via the same decoder matrix of the receiver.

All information is time gated on passing to or from the Z register, Block 1. The Z register is the accumulator, the heart of the computer. All inputs and outputs pass through the Z register, which receives and sends signals from and to the adder.

The J register, Block 2, is the storage register for operational instructions. It controls the adder and the sequence of F states that are to be followed for each instruction.

After an operational code is sorted in the J register, the first two addresses are obtained, the operation is performed, and the results are stored. Then the third address is obtained and

7443

162.79

Figure 15-22.—Block diagram of computer organization.

decoded to obtain the cell into which the results are to be placed.

The F-register, Block 3, is called the "sequencer" and is actually a coarse control to sequence the computer to perform the desired operation while other registers in the computer derive the discrete timing and control necessary for the operations.

The G-register, Block 4, consists of three flip-flops and is used in 11 of the 16 F sequencer states. The G register, called the gamma counter, is used to synchronize the computer with unclocked input data and it controls finer timing for memory access. The G counter sequences, in a particular F sequencer state, to enable word timing signals for setting the memory addresses to select a word and to relocate this word as desired. In the F sequencer states where the G counter is used, the counter will not sequence to a new F state until the G counter has sequenced properly. The eight states of the gamma counter are displayed on the Tester by the eight lights labeled γ.

Timing is provided in the computer by the clock system and the P counter. The basic clock pulse has a repetition rate of 125 kc and this rate is derived from a free running 1-mc oscillator. Elements of the P counter synchronize the clock pulse and also provide a means for inhibiting the clock. The five flip-flops of the P counter, Block 5, count a standard word length of 32 bits, as well as the 8-bit timing used in address manipulation and the 4-bit digit data.

Although the standard word is 32 bits, it may vary to a shorter word, as when tape data is to be entered or when four bit shifts are to occur. By setting the initial P counter state at the complement of the number to be counted, the P counter then acts as a down counter. For address manipulation, the complements of the address

7444

162.80

Figure 15-23.—CP-827/SRN-9 test device.

are injected. When this counter overflows, it signals the computer that the correct word length has been counted and turns off the S flip-flop to inhibit any further manipulation at this time. The P counter remains in the 32nd bit time for two full bit times during which logical functions are performed for correct computer sequencing.

The S-register, Block 6, is the main timing flip-flop which transmits shift pulses to the Z-register and the memory planes, as controlled by the P counter. The S counter remains off for either one or two pulses, during which time the memory drive circuits are reset and the F and G counters are reset to new states. When the Z-register is to be shifted, the P counter controls the S-register action to cause the shift. When the P counter overflows, this causes the S-register to turn off. Therefore, the S-register is on for the number of bit times conditioned by the state of the P counter. The F- and G-registers do not change their states until after the S-register has been turned off, allowing at least one clock pulse for sampling the end result of all states. This S flip-flop controls the memory by inhibiting or enabling the drive circuitry. Since all memory outputs must pass through the Z-register via the adder, the Z-register must see the same shift pulses as the memory. These are the pulses that drive the memory.

The adder controls all access to the memory and performs various arithmetic operations required by the operation instructions.

The W register (front of control panel in fig. 15-17) consists of four flip-flops, W01 through W04 which are used to drive indicator lights. Their primary purpose is to give a visual indication to the operator entering the ship's data or manual data. At this time, the lights are set and reset in such a sequence that by reading the binary number shown by the W01 through W04 indicator lights, the operator can determine what has been entered manually in the navigational program.

AN/SRN-9 RF TEST SET

The AN/SRN-9 RF Test Set is designed to provide fault isolation in the AN/SRN-9 Electronics Group and to provide a means of checking the AN/SRN-9 Mast Group. The AN/SRN-9 RF Test Set provides simulated satellite signals on 400 mc and 150 mc. The 400-mc output is phase-modulated to produce a test message.

Physical Description

The RF Test Set (fig. 15-24) operates on 115 VAC, 60-cps power. It also operates on battery power when it is required to the check the Mast Group. It is composed of two major sections: One side of the set contains the Modulation Switch, the fuse holder and voltage indicator lamps, and three pushbutton switches for BIT, MSG, and WORD synchronization. The remaining jacks and phase delay adjustments are for use with other test equipment and may be disregarded for purposes of this discussion. The major r-f test hookup points, selection dials, and attenuators are contained in an r-f section which can readily be removed for battery operation when it is necessary to climb the mast to check the Mast Group.

The selection dials are as follows:

1. POWER—3 positions, for OFF, INTernal, or BATtery.
2. DOPPLER—INTernal OSCillator selects 32 kc and EXTernal OSCillator selects 26 kc or 52 kc.
3. ATTENUATORS—10 db steps for both the 150-mc and 400-mc outputs. A jumper cable is furnished to hook either output into the center attenuation

7445

162.81

Figure 15-24.—SRN-9 RF test set panel controls and switches.

3. ATTENUATORS Continued

selector which is in 1 db steps and thus permits finer selection of attenuation characteristics.

Four basic modes of test hookup can be used to isolate basic operational malfunctions. The sequence of these tests is as follows:

1. Readiness Check—prints a test message, variable doppler count.
2. Radiation Check—prints a test message, variable doppler count, varying AGC.
3. Mast Check—no test message, no doppler count.
4. Doppler Purity—prints test message and fixed doppler count.

Readiness Check

The purpose of this test is to check the ability of the Electronics Group to lock on a test signal and decode a test message. The RF Test Set will furnish a simulated satellite signal to the Navigation Set. Therefore, the procedure for acquisition and locking onto the signal is identical to that used for a satellite pass. The printout obtained from this check is a predetermined message of alternating words of zeros and nines, followed by a message of threes and sixes. Each two-minute message will consist of one of these combinations and will end with a doppler count which will not be stable for this check and may be disregarded. If, as a result of this check, all message printout is normal, it can be assumed that all sections of the

7446

Electronics Group are functioning properly and any loss of sensitivity will require a Mast or Radiation Check.

Radiation Check

The second check that can be performed is a radiation check. It renders a variable doppler count and varying AGC. This check isolates a completely malfunctioning Mast Group (Electronics Group not receiving any signal), without necessitating climbing the mast. The test set attenuation settings are at 0 db and the Modulation Section Switch on INT MSG. Using the normal AN/SRN-9 equipment setup with the Mast Group connected to the Electronics Group, if signal lock-on or proper message printout is not obtained, proceed to Check No. 3. If all indications are normal, proceed to Check No. 4.

Mast Check

If there is an improper message printout, or no test signal lock-on is obtained, climbing the mast is unavoidable. It is assumed that all connections of the Electronics Group, including a-c power, have been verified to be correct. For this test the RF section must be removed from the Test Set, and arrangements made for communications between the man on the mast and the operator monitoring the received signal at the Electronics Group of the Navigation Set. This test gives a sensitivity check of the Mast Group. A low sensitivity in the Mast Group would indicate the need for replacement.

Doppler Purity Test

The Doppler Purity Test provides a test message and a fixed doppler, although the message is of no consequence in determining the accuracy of results of a navigational fix. This test will reveal any power line noise which can cause doppler errors. If the Doppler Purity Check is not passed, the 115-VAC power must be checked for transients.

7447

APPENDIX I

TRAINING FILM LIST

Certain training films that are directly related to the information presented in this training course are listed below under appropriate chapter numbers and titles. Unless otherwise specified, all films listed are black and white with sound, and are unclassified. For a description of these and other training films that may be of interest, see the United States Navy Film Catalog, NavWeps 10-1-777.

MF AVAILABLE IN VT-ERIC SET.

PUB DATE - ND 122p.

DESCRIPTORS - *CURRICULUM GUIDES; *HOUSING MANAGEMENT AIDES; *VOCATIONAL EDUCATION; MANAGEMENT EDUCATION; ECONOMICALLY DISADVANTAGED

ABSTRACT - Developed by the Rental Housing Association of the Greater Boston Real Estate Board, this training course includes all major categories of real estate management practice. Intended as a 2-week course, the lectures, discussion groups, and field trips are oriented toward socioeconomic and behavioral topics, particularly with regard to low income groups. Certificates are provided for persons completing the course. (BH)

CONTENT OF COURSE

All major categories of standard real esta
cluded in the course content. Substantial emphas
and reasons for policy and modus operandi; yet,
insure inclusion of substantial practical detail
these principles.

Pertinent sociological problems prevalent
society at large are discussed clinically and ill
method in order to better understand the tenant a
socio-economic and behavioral topics.

Reference material is suggested for supple
yond that which the scope of the course permits.

7465

CONTENT OF COURSE

major categories of standard real estate management practice are in-
the course content. Substantial emphasis is programmed for the theory
s for policy and modus operandi; yet, great care has been exerted to
lusion of substantial practical detail for every-day application of
ciples.

tinent sociological problems prevalent in low income groups and our
large are discussed clinically and illustrated by the case history
order to better understand the tenant and his work. This will include
omic and behavioral topics.

erence material is suggested for supplementary study and research be-
which the scope of the course permits.

METHOD OF PRESENTATION

The course is designed so as to be most beneficial wh
week (ten-day) period. Some sessions will provide intense i
management led by experienced lecturers and managers from pu
ing. Training aids, current forms, and illustrations will b
are planned for discussion groups, further investigation of
trips, with the major emphasis centering around student part
tion.

Certificates of completion of the course will be issu
attending the full course. Tests or quizzes may be given at
the instructor to be used as a measure of progress and a tea
as a criteria for successful course completion. Such materi
seminars and workshop sessions shall be supplied by the cour

7467

METHOD OF PRESENTATION

urse is designed so as to be most beneficial when given over a two-
) period. Some sessions will provide intense inquiry into areas of
d by experienced lecturers and managers from public and private hous-
g aids, current forms, and illustrations will be used. Other sessions
or discussion groups, further investigation of subject matter, field
he major emphasis centering around student participation and contribu-

icates of completion of the course will be issued to those persons
full course. Tests or quizzes may be given at the discretion of
r to be used as a measure of progress and a teaching tool, but not
for successful course completion. Such materials as are needed for
workshop sessions shall be supplied by the course moderator.

SESSION FOUR: LEASING

OBJECTIVE:

To explain the basic concepts of the leasing agreement to property managers and prospective property managers in order that they may better understand the landlord/tenant relationship and the rights and obligations thereto, and thus make the real estate property manager better equipped to carry out his management functions. Responsibilities are assumed by all parties to the lease contract. It is the purpose of these individual obligations and their interdependent relationship that we will observe.

SUGGESTED MAT

ndividual obliga-
nt relationship

SUGGESTED MATERIALS:

Rental Housing Association Lease Form

Boston Housing Authority Lease Form

I. THE LEASE: WHAT IS IT?

A. Estate in land

B. Possessory interest as distinguished from license

1. Mere license to use space is not lease. Example: laundry area or concessions

2. Contractual - lease or tenancy can't arise from trespass

3. Lodging houses - common law, occupants, licensees

a. Statute: G. L. Chap. 186, sec. 17. Three consecutive months are tenants-at-will

C. Consideration - money or kind

1. Leasing agreement must have consideration, usually rent

NOTES

istinguished from

se spac is not

e consecutive months
s-at-will

kind

must have consider-
nt

7542

D. Distinguished from tenancy-at-will

1. Writing

2. Termination

a. For breach

b. Mutual - surrender and acceptance

E. Contract - contains covenants and agreements

1. Independent covenants

2. Dependent covenants

F. Term of lease

1. Automatic renewals

2. Notice

r and

nd agreements

G. Parties to lease

1. Who may be landlord - agents

2. Minors

3. Guarantors and sureties

4. Discrimination as to race, creed, etc.

II. ILLEGAL PROVISIONS AND PROHIBITED USES

A. Covenants prohibiting children
(G. L. Chap. 186, sec. 16)

B. Exoneration of landlord from negligence
(G. L. Chap. 186, sec. 15)

C. Illegal gaming, sale of alcoholic beverages, prostitution

1. Creates legal nuisance
(G. L. Chap. 139)

NOTES

ce, creed, etc.

egligence

lic beverages,

7546

2. Landlord may elect to terminate lease

3. Duty of landlord to evict or be guilty himself

D. Provisions waiving tenant's rights under municipal or state codes - not void per se, but may be if specified in ordinance

III. LANDLORD'S OBLIGATIONS

A. Covenant of quiet enjoyment

B. Maintenance and repairs

1. Sanitary code and municipal codes

a. Conflict with lease

b. Financial responsibility by contract

2. Gratuitous repairs

3. Common areas

7547

NOTES

rminate

t or be

ghts under
void per

icipal codes

lease

onsibility

7548

C. Services as part of rental

1. Heat, light, elevator, etc. - anything not specifically agreed but area custom

a. See also G. L. Chap. 186, sec. 14, re willful failure by landlord to supply foregoing items. Criminal penalty.

b. Cannot shut off light, heat, etc., if tenant fails to pay rent

IV. TENANT'S OBLIGATIONS

A. Use premises in tenant-like manner

1. For lawful purposes only

2. Generally purpose specified to exclusion of other purposes

B. Not to commit waste

C. Cleanliness

1. Waste and rubbish disposal

2. Insects

D. Rent payments

1. Late charges and penalties (G. L. Chap. 186, sec. 15B)

2. When rent is payable - end of month, absent contract

3. Landlord has no lien for rent except innkeeper, hotel or lodging house manager

E. Abide by safety and other rules for the building promulgated from time to time

F. Pets

NOTES

of

nt ex-
dging

r the
time

7552

G. Allow access to landlord to inspect, make repairs

1. Absent provision in lease; landlord has no right to enter during term (now see G. L. Chap. 186, sec. 15B)

2. State sanitary code provides tenant must give landlord access to correct violations

H. Occupancy - limited to named lessees only

1. Number of occupants may be limited by local zoning

I. Yield-up at expiration of term

1. Very important. Hold-over tenants liable for all loss caused by holding over.

gations in the

for breach of

7556

VI. SECURITY DEPOSITS

A. Security for performance of obligations of lease

1. Not prepaid rent

2. Amount of deposit

B. Refunding - no interest possible

1. No other rent owed

2. Prompt inspection for damages

3. Tenant has vacated - where to send check

NOTES

C. Keep tenant advised

1. Let tenant know before he moves that you intend to refund promptly if all is okay - tenant will be more cooperative

2. Return of keys

NOTES

now before
t you intend
omptly if all
nant will be
tive

ys

7560

VII. REMEDIES OF LANDLORD

A. Suit for breach

1. Landlord can sue each month as payments are due

B. Eviction

1. On breach of covenants, landlord can give proper notice as provided in lease to terminate lease. Can then follow up with court action to get order evicting tenant

a. In Massachusetts, landlord cannot enter premises for this purpose or lock out the tenant without court order (G. L. Chap. 186, sec. 15B)

b. Proper notice to terminate

i. State reason or reasons

ii. Indicate clearly the effective termination date

NOTES

ependent.
incon-

NOTES

7564

B. Statutory rent withholding
(G. L. Chap. 239, sec. 8A)

1. Violations of sanitary code

2. Tenant gives notice of intent to withhold

3. Notice from public authority as to violation may be deemed to be notice from tenant (Chap. 355, Acts 1969)

C. Rent receivership
(G. L. Chap. 111, sec. 127A-K)

1. Tenants affected can petition court to appoint receiver to collect rents and run building. Pay rents into court. Landlord restrained from evicting, etc.

D. Stay of judgment

1. Where tenancy is terminated without fault of tenant, court may grant discretionary stay for hardship. In Massachusetts, presently the courts may give up to six months.

ntly the
ix months.

7566

E. "Constructive Eviction"

1. Dangerous for tenant, difficult to prove. Usually adjudicated only in cases of no heat for several days during winter. Must have serious deprivation by landlord of the use and enjoyment of premises.

2. Tenant must move out of premises

IX. RETALIATIONS

A. Prohibited in Massachusetts (G. L. Chap. 186, sec. 18)

B. Civil damage suit for three months' rent

C. No eviction if retaliatory

D. Under Massachusetts statute, if tenant has made complaint to health authority within six months of notice to quit, presumption of retaliation

on

7568

E. Absent statutes, only District of Columbia (lower court) has held retaliations to be illegal and against public policy (Edwards vs. Habib, 397 F.2 687, 1968)

X. EXECUTION OF LEASE

A. Representative capacity

1. Agent should designate he is agent for landlord. Otherwise might not bind landlord and may be personally liable.

B. Authority of agent

1. Varies - but agent should not make promises not contained in lease, which he has no authority to make

C. Signature of tenants

1. Best to have all tenants signing be present at same time

2. Landlord or agent should see them sign if possible

y District of Columbia
ld retaliations to be

3. Suspected minor - check identification if you have doubts

4. Guarantor's signature. Have him present

5. Initial changes in printed forms

D. Occupancy

1. Until leases are complete with all signatures, and you are satisfied as to genuineness, do not allow tenant to occupy premises

E. Alterations

1. Do not add or detract from lease after tenants sign

F. Delivery

1. Give tenant a signed copy of lease as soon as possible. Without delivery, a lease may not be effective and you may have only a tenant at will.

SUGGESTED MATERIALS:

Letter to tenant - scheduling move-in date

Tenant form - receipt for keys, lease, etc.

Tenant form - "Welcome" letter

Tenant form - General information sheet

7573

7574

I. SCHEDULE MOVE-INS

Make definite appointments so as not to congest elevator.

II. CLEAN APARTMENT

Make sure apartment is ready, clean, for scheduled move-in day.

III. PRE-MOVE-IN CHECK

The manager should personally inspect the apartment to insure it is ready.

IV. KEY CONTROL

Do not release keys to the apartment until you are ready to have the family take occupancy of the apartment. (Once you release keys, you release the apartment.)

nce you release
nent.)

7576

V. RECEIPT OF KEYS

Make sure you receive receipt for keys given to tenant. Also make sure you give keys to person who signed lease or authorized representative.

VI. INSPECTION OF APARTMENT WITH NEW TENANT

When keys are released, manager should escort tenant to new apartment as a form of welcome. Manager should note, in presence of tenant, any shortcomings in the apartment and make note of the items. (This precludes later claims by tenant that paint was bad, mirror missing, etc.)

Manager should also stress correct way to lock apartment (double bolt at all times) for security reasons.

Manager should give tenant "welcome" letter and "Information Sheet."

VII. TENANT VISIT

Manager should drop in to the apartment first evening, if possible, or soon thereafter, to see if everything is all right. Invaluable for showing the manager "cares" and tenant is appreciative of attention.

SESSION SEVEN: HOW TO ACHIEVE TENANT COOPER

OBJECTIVE:

To examine the relationship between the manager and residents. The subjects that the relationship and communication are about are those covered in other sections of the project.

A resident must be aware of the responsibilities assumed when he is part of a housing-group society. He must pay rent, get ride of trash, clean his home, respect the neighbors.

SESSION NINE: REPAIRS, MAINTENANCE, PURCH

OBJECTIVE:

General preservation of the bricks, mortar and boards of real estate is an area where responsible management must give continuing attention. Tenant needs, property values and neighborhood considerations dictate such. This session will present categories of repairs and maintenance, review materials and supplies and explore budgeting, scheduling and purchasing.

DESCRIPTORS - *VOCATIONAL EDUCATION; VOCATIONAL HIGH SCHOOLS; *RELEVANCE (EDUCATION); *COMMUNICATION SKILLS; *TEACHING GUIDES; STUDENT NEEDS; *ASSIGNMENTS; READING INSTRUCTION; SENTENCES; CAREER PLANNING; STUDENT ATTITUDES

ABSTRACT - This document includes both a teacher's manual and student exercises for a course in communications skills and was prepared to help the vocational student develop skills necessary for effective communications in the world of work. These materials have been tested in a tenth grade class and revised accordingly. The teacher's guide includes sections on (1) Becoming a Good Student, (2) Loosing Toward a Career, (3) Reading Newspapers, (4) Improvement of Reading, (5) Dialects, and (6) Kernel Sentences. Student assignments which correspond to these sections are included. (JS)

FOREWORD

The Little Rock Public School System is pleased to make available a course of study in Communicative Skills - Grade Ten. The book consists of Student Exercises and a Teacher's Manual written by Mrs. Lela Willis, project director. Mrs. Willis worked under the general direction of Mr. John Fortenberry, assistant superintendent for instruction; Mrs. Josephine Feiock, supervisor of English; and Mr. Ernest L. Rush, director of industrial and vocational education.

Mr. Rush's concern for the vocational student who drops out of high school because he does not pass academic subjects caused him to seek answers. Mrs. Ruth Steele, an English teacher at Metropolitan High School, had experimented with ideas for lessons to make English relevant to her students' interests and needs. A Small Research Project Grant was received in 1968 and work on an innovative program in communicative skills was begun. Mrs. Willis was chosen as project director because of her interest in discovering methods that would reach terminal students. The lessons and teaching guide were used on an experimental basis by Mrs. Steele, the participating teacher, in her tenth grade classes. The lessons were revised and Mrs. Steele's tests and units that came from student suggestions are included in this book.

We feel that this project has been a step toward providing English materials relevant to the interests of vocational students who must be able to communicate effectively in a work world upon graduating from high school. The needs of a special group of students--those not college bound--are being met.

Floyd W. Parsons

Floyd W. Parsons
Superintendent of Schools

PREFACE

The lessons in this book have been a step toward providing English materials relevant to the interests of vocational students who must be able to communicate effectively in a work world upon graduation from high school. The materials have been designed to fit into a sequential plan with grades eleven and twelve but also may be used as an entity.

The lessons have a built-in inductive approach which provides for extensive student participation in the formation of concepts and ideas. It should be emphasized that although the lessons are carefully structured, Communicative Skills is not designed to teach itself. It is not a workbook. The teacher must play an active role in stimulating and guiding class discussion. The teaching manual should be studied in connection with the matching student exercises. The teacher should be alert to student comments when thought questions are discussed.

The communicative skills are reading, writing, listening, speaking, thinking, and social (getting along with others). A hidden value is the development of positive attitudes toward working and studying. Well-prepared and creative teachers can adapt the materials to fit the special needs of their students.

OVERVIEW

SCOPE

Becoming acquainted with high school environments, especially Metropolitan High School

Reviewing study skills

Getting along with others

Finding individual weaknesses in using language skills - reading, writing, speaking, listening, and thinking

Giving students opportunities to talk about themselves and to learn about others

OBJECTIVES

To provide group and individual activities through which the students develop a relaxed attitude towards fitting into the high school program

To maintain a relaxing atmosphere conducive to enjoyable learning and teaching

To practice techniques for studying

To help the student to grow in his attitudes toward learning

To help the student to gain an understanding of himself

To help the student look towards an occupation for himself

To help the student develop enjoyment and competence in reading

EXPECTED OUTCOMES

Development of a positive attitude towards learning

Recognition of the importance of communication on all levels

Recognition of the importance of setting a goal in life with tentative ideas about an education

Identification of a work world and its problems in communication

7708

TO THE TEACHER

The instructional packets of materials designed to improve the communication skills of students in vocational-technical schools have been devised on the premise that every student must succeed in some way before he can be motivated to learn even basic skills. Therefore, it is quite important that the teacher find the level of understanding of each student and begin instruction from that point. To do this the teacher needs to develop a permissive atmosphere in a disciplined or controlled classroom environment. The vocational student will respond to the resulting orderliness because he likes meaningful discipline. Students want reasons for what they are doing and should never be kept in the dark about reasons for assignments, for reading, and for any other plans of classwork. The student's slightest suggestions for class activities should be accepted and commented upon.

Probably the key to helping the student gain self-respect is to praise him often. No red marks should be put on papers for errors during the first weeks of a school term. Instead, use the red pencil to circle something that is a good idea. Give a mark of approval for whatever you can, and refrain from commenting on errors at first. Record the student errors in your notebook and devise exercises for all the students to help them correct errors in grammar, usage, and spelling.

Avoid frustrating the students with assignments that they cannot do or do not understand. The lesson numbers in the packets are used to indicate a sequence and not to indicate daily assignments.

7709

EXPLANATORY NOTES AND GLOSSARY

CLASS SETS:	Materials provided by the school for classroom use: desk dictionaries, a set of encyclopedias, an unabridged dictionary, Student Handbook, Julius Caesar (Globe Book Company), The Pearl by Steinbeck (Bantam Pathfinder Edition), pamphlets on How to Use the Readers' Guide (H. W. Wilson Company), The How in Parliamentary Procedure (The Interstate, Danville, Illinois), Impact Series: At Your Own Risk (Holt, Rinehart, Winston), Career booklets, (New York Life Insurance Company), Tactics for Perspectives (Scott, Foresman)
EXERCISES:	Single learning tasks provided for the student in response to a specific behavorial objective
FLEXIBILITY:	Even though the teaching modules are designed to be used in sequence, they are flexible so that the teacher may profitably use a single unit out of sequence. The lessons are also flexible so that the teacher may add materials that fit her students or omit those materials that are not appropriate and make a complete presentation.
FOLDERS:	One with staples for the Student Exercises; regular manila folders for filing
LESSONS:	Instructional parts of a module; a term used to indicate sequence of presentation and not a limited time
LOGS:	Student logs for three weeks each; teacher log on poster board for classroom display
PAGINATION:	T + number - Teacher's Manual S + number - Student Exercises
POST-TESTS:	A standard test; teacher-student planned tests; teacher-made tests; student evaluations
PRE-TESTS:	An inventory used at the beginning of a teaching module for student orientation to the subject
TEACHING MODULES:	Teaching units on a single subject

7710

INTRODUCTION

After reading the section directed "To the Teacher," some teachers may need to readjust their thinking about a philosophy of teaching. At no time in these lessons do we intend to forget the student by concentrating on merely a presentation of subject matter.

The teacher should become familiar with an entire teaching module so that she can blend her ideas and the students' ideas. Motivation is easier when there is teacher-student and student-teacher rapport. The teacher assumes the role of a leader, a participant, a listener, and an aide.

Class organization may begin by listing supplies the students will need. The list may be written on the blackboard, or presented on a transparency, or dittoed.

1. Dictionaries

   a. Pocket size
   b. Desk edition (A class set of these may be provided by the school.)

2. Loose-leaf notebook (six divisions)

   a. Assignments
   b. Language
   c. Literature
   d. Composition
   e. Miscellaneous
   f. Vocabulary and Spelling

3. Textbooks

   a. Literature Anthology
   b. Class sets of paperbacks
   c. Library books

4. Other needs

   a. Ink pen
   b. Pencil with eraser
   c. Loose-leaf paper

7711

NOTEBOOKS

Learning to keep a neat notebook is a step towards becoming a good organizer of materials and thoughts. There will be time to jot down class notes, and the students will find time to add interesting and worthwhile materials under the different headings in their notebooks.

1. Assignments

    a. Book reports
    b. Special projects

2. Language

    a. Language skills - note taking
    b. Communicative skills - reading, thinking, listening
    c. Special language problems
    d. Language history

3. Literature

    a. Reading techniques
    b. Discussion and note taking

4. Composition

    a. Rules for composing
    b. Mechanics of writing
        (1) Punctuation
        (2) Capitalization

5. Miscellaneous

    a. Interesting clippings
    b. Cartoons
    c. Student ideas
    d. Student comments
        (1) Dated
        (2) Titled

6. Vocabulary and Spelling

    a. Study the Official Spelling List - Little Rock Public Schools
    b. Write definitions of words according to the (NP_1 + VP + NP_2 + *Modifier*) sentence pattern
    c. Note new words that you hear and read

7712

KEEPING A LOG

Log sheets should be checked by the teacher at the end of each three-weeks period. At the end of a grading period (either six or nine weeks), the teacher may use the log as one criterion for evaluating the student. The student reports what was done in each day's English class and comments on what was done. The teacher may ask that the sentence definitions of the word "log" be handed in.

The teacher should prepare an enlarged copy of the individual logs with subject or topic headings for each day. This is an excellent way to teach the students that plans can be changed and at the same time an orderliness in recording can be maintained.

INTRODUCING THE LOG IDEA

We would like for everything we do in our classroom to be practical and meaningful to all of us. The purpose for our keeping the log is to measure our progress. Let's read together "Why we should keep a daily record." We do need to know exactly what a log is, or let's say we need a "working definition" of a log. (Decision by students and teacher)

Now that we have a definition we can think about an economical way to keep our daily record. You will notice that the space for daily notations is limited. You may want to make extra comments on these 3" X 5" cards. Encourage the students to be frank in their remarks. The logs are confidential. They are not graded. Honest, but positive, remarks may be written (not in red ink) to the student for the purpose of encouraging him to keep talking.

The teacher may note and write in her notebook the misspellings of common words (Note the Official Spelling List - Little Rock Public Schools.) and errors in composition. Time will be given for classwork drill to correct these errors. Do not single out students except to point out the progress one is making. Every student must feel that he is succeeding in some way.

THE COMMENT CARD

In a box in the classroom you will find 3" X 5" cards. From time to time you may feel the urge to comment on something that you have read in a newspaper or magazine, or that you have heard on TV or the radio, or that we are doing in class. Write your comments legibly on one of the cards. You do not need to sign your name. The cards will not be shared unless you write share on the card. Be sure to date the card.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

PRE-TEST

Read the questions with the students. Ask them to write answers to some of the questions, possibly the first eight. Allow a student to write, "I don't know," if he wants to, but encourage him to attempt an answer. Take the papers. Discuss with the students the questions that arise.

Questions 9, 10, 11, and 12 may be presented in the next class period. Ask the students to write their answers in complete sentences. Allow as much time as is needed for discussion of the meaning of each question before letting them write on their own. Place the pre-test answers in the students' individual folders for reference.

1. What are credits?

2. How many units are needed for graduation from Metropolitan High School?

3. What occupation would you like to pursue?

4. What courses will aid you in understanding the work world involved in this occupation?

5. What are "elective courses"? Of what value are they?

6. What are communication skills?

7. Are communication skills learned only in an English classroom? Explain your yes/no answer.

8. What speaking skills will you need after you graduate from high school?

9. What are <u>your</u> strong points as a student?

10. What do you consider your weaknesses to be?

11. Tell how attitudes are important for you as a student.

12. We are agreed that it is important that we get along with others. When will you be tested on how well you get along with others in school and out of school? Be specific in your answers.

NOTEBOOK ASSIGNMENT

From time to time list in your notebook any ideas you may have about other things you will need to know before you can become a good high school student. Title this page of your notebook "Becoming a Good Student."

Be sure you understand the meaning of the underlined words:

1. We need to develop positive <u>attitudes</u> towards life.
2. Sometimes <u>communication</u> is lost because one is a poor <u>listener</u>.
3. A student should take an <u>inventory</u> of his work <u>skills</u>.

112

THE STUDENT HANDBOOK

Lesson One: Approach

Each of you has a Student Handbook. On page 10 you note our first topic is "Organization." The first thing we need to do is to orient ourselves. On the maps on pages 11 and 12, locate where we are. On page 11, which general building are we in? On page 12, specifically, which room are we in? Where is your home room? We know about home rooms, but let's read the material on page 10. Listening in home room will be our first step towards developing orderliness in our school day. (Discuss)

Two time schedules are given on page 13. One is for the days when we will have assemblies. Let's read on page 10 about assemblies. Do you have any questions? The word assembly may be added to your vocabulary list. What is a word that is a synonym for assembly? Probably someone will say convention or the word may be looked up in the dictionary. What do you know about conventions? What is the difference between a convention and an assembly? To be accurate you may want to check your dictionaries again.

Some of the students may want to prepare a map as suggested in the student assignments. One may want to prepare a larger map for the bulletin board - a good idea.

Lesson Two: Student Schedules

Let students feel free to discuss their schedules. Lead all of them into an understanding of elective courses, credits, and units.

Study page 25 with the students. Pause between the requirements listed to give the students a chance to take inventory.

Give the students specific directions for the writing assignment. If you have not done so, explain carefully how you want the papers identified. Keep the schedules in the students' individual folders. Discuss the writing of the schedules thoroughly before the students begin work. Do not accept a finished schedule until it is neatly done.

Lesson Three: Rules and Regulations

Check-test for the reading for comprehension assignment. Check only for meaning. The questions should be dittoed so each student has a copy.

1. For what excuses are blue readmittance slips given?

2. Where may you get a student identification card to allow you to ride the city buses at a reduced rate?

3. Give one rule for using the telephone.

4. What is the purpose of the early morning study hall?

5. How may a student leave school early?

6. How may one be admitted to the health room?

7. Why may you not want to wear a hat to school?

8. Who may eat lunch at home?

9. How may a student get his name on the honor roll?

10. Give two rules that must be obeyed if one brings a car to school.

11. Define tardiness according to the handbook.

12. What is the punishment for being truant a second time?

13. What must you do when you bring a visitor to school?

14. How is traffic in the halls controlled when classes are in session?

Discuss student questions and ideas that may come from their reading.

Let the students talk about discipline and self-discipline. Give the students time to write these words in their notebooks.

At the end of this class period or at the beginning of the next period, ask the students to write three to five sentences giving their ideas on "The Importance of Self-discipline."

Lesson Four: Club Activities

Read pages 36-40 carefully. Call on your own experiences in participating in club activities to indicate the advantages and the disadvantages in belonging to clubs. Emphasize that when a student becomes a member he must be a participating member. Give as much help as you think is needed in helping the students prepare their oral contributions. Since this is the first time the students have been asked to speak on their own, they may not want to stand before the group and make what to them is a formal speech. Try to insist on everyone's preparing something to say. Maybe a student would rather sit in the group while offering his contribution. Those who do not respond orally should hand in a written outline so you can check on the logic of their thinking.

New words that should be discussed are substantiate, specific, and extra-curricular activities. The word curriculum can be introduced at this time and related to course of study.

AN ENGLISH CLUB:

Try to lead the students into wanting some kind of English Club. Do not let the forming of such a club become cumbersome. The purposes would be to arouse student interest in initiating ideas for study; to help students to participate in group work; to inspire creative writing; to play roles

in drama; to teach parliamentary procedure by actually using it; to promote respect for the rights of others; to locate talents that might not be recognized in an always formal atmosphere; to develop a freedom in thought and movement in the classroom; to practice social skills.

If a club is formed, officers may be chosen each nine weeks so that more students can benefit from assuming responsibilities. Committees like program planning, bulletin board, nominating committees, etc., can give other students a chance to participate; and involving others in publicity, liaison, etc., will give everybody a chance to adjust to working together in a group.

Lesson Five: Service

Allow plenty of time for free discussion of the services a school offers and about schools as businesses.

Talk about listening manners before the guests, the principal, and the counselor come in to speak to the class. Let the students, with your guidance, formulate a set of rules for listening and write them in their notebooks.

If you feel that the students would like to, you may help them to write invitations to the speakers. This would be a good opportunity to point out why invitations should include specific information.

The students may be asked to take simple notes. If this is not feasible, review the speeches with the students and ask them to record the pertinent information.

NOTEBOOK ASSIGNMENT

The planning for a practical class routine should be the cooperative effort of the students and the teacher.

BECOMING A GOOD STUDENT

Cooperate with the students in trying to set a pattern for establishing a practical daily routine. This will require time, but it will be time well spent.

Give the students time to arrive at tentative definitions for habits and skills.

Lesson One: Developing Study Skills

Ask the students to answer the true/false questions quickly. Answers may be checked in class, and student questions and comments should be discussed and noted in the teacher's notebook.

Lesson Two: Textbooks as Tools

SUGGESTED TEACHER PRESENTATION

You may begin by saying that before you can do a good job of studying, you must become acquainted with available tools. I have named some of the tools on your list of supplies. First let's look at our textbooks. You should have bought your books and have them with you today.

First look at your Warriner's English Grammar and Composition or another English textbook.

The title page of a book is a right-hand page. Find the title page in your grammar book. What information do you find? (title, authors, contributors, publisher, place of publication) Let the students give the answers orally. Be sure everyone else can hear each student as he answers.

The back of the title page is called the copyright page. There are several dates after the word copyright (c). What do you think the dates refer to? (The year of copyright is the year in which the book was first published. If new matter were added later, or if the book were revised, there will be additional copyright dates referring to the years in which these changes first appeared.) Sometimes a supply of books is exhausted and a new printing is made. The date of the reprinting is also recorded on the copyright page. Ask the students this thought question: Why is the copyright date more important than the reprint date of a book? (Discuss the answers.) Tell the students why an author wants a copyright. Show them a copyright certificate, if one is available.

What is the title of the introductory page in your text? What other titles have you noted for introductory pages? (foreword, introduction) Turn to

page ____ (page number of the table of contents). What is the heading of this page? (contents) Of what use will this listing be to you?

Turn to page ____ (the index). What is the title for this page? How is this section of the book different from the contents page? How is it similar? Do you consider this a good index? Why? (Explain what a definitive index is. The students will note its usefulness.)

Check on the students as they fill in the blanks in Listening: Exercise Two and assist those who seem to be unsure of themselves.

Place the vocabulary words on the board. Some of the words are new: collate, blurb, glossary, and frontispiece. Explain that the new words will be used in your next lecture.

Lesson Three: Taking Care of Books

Sum up the discussion of rules for caring for books by giving the following lecture and demonstration. Tools for the demonstration: (1) A new book in its book jacket (2) A library book in which a blurb has been pasted (3) A book that has a frontispiece, a dedication, an acknowledgment

You may begin by saying, "If a book is handled intelligently, it will last a long time; if mishandled it will become dirty or torn, or come apart at its binding and lose its usefulness." A new book should be opened properly. First remove the book cover and lay it to one side. Place the book on a level surface on its back edge, and holding the pages upright, open both covers. With the index finger press down along the inside edge of each cover. Turn down about ten pages at the back of the book and press down as you did the covers; then turn down about ten pages at the front of the book and press down the inside edge with your forefinger. Continue this alternately with front pages and back pages until you reach the center of the book. After the demonstration, ask the students how opening the book in this manner will cause it to last longer. No book is useful unless it has all its pages in order. The process of checking to see if all the pages are all right and in order is called collating a book. We do this by turning the pages of the book one at a time. This is also a good time to clip pages apart that may not be cut. If the book is acceptable, then the material about the book (blurb) and/or author may be clipped from the book jacket and pasted or taped in the book. When you are ready to place the book on a shelf, put its back edge flush with the edge of the shelf. Do not crowd books. One should be able to remove a book from a shelf by grasping its back edge between the thumb and forefinger.

Some books have other parts that your grammar book or another textbook does not have - frontispiece, dedication, or acknowledgment. (Show the students the books that have these parts. They might also be interested in end papers.)

PRACTICE ACTIVITY

Some of the students may be interested in finding library materials on how a book is made. Encourage them in their efforts by helping them to find readable materials and aiding them in preparing illustrations and charts to help them to explain what they find to other members of the class.

Lesson Four: Introduction of Library Tools

Everybody should acquire the library habit. Today, when we have so much leisure time, visiting a library can be a most profitable pastime. We have talked about the worth of a single book and how we can use a book as a tool. A library is a storehouse for all kinds of books. If you learn the techniques for using one library, you can be at ease in any library. Check the list of library techniques on page 488 in Warriner's. Which ones are you acquainted with? Are there any that you feel you already handle skillfully?

How are fiction books arranged on the shelves in the library? After this we will use the word stacks to refer to shelves of books in a library. Do you know why they may be called stacks? (Tell the students how floors of shelves are placed on top of each other like the floors of storied buildings.)

Explain the Dewey Decimal System. Dictate these titles and let the students write the general number that classifies the book:

Fenner: Stories for Fun
Zinn: Alligators and Crocodiles
Bergere: Logging
Webster: Daddy Long-Legs
Lamb: Tales from Shakespeare
Clark: Thomas Alva Edison
Bulfinch: Mythology
Stevenson: A Child's Garden of Verses
Jones: Seeing Japan

Lesson Five: The Card Catalog

The card catalog is a file of cards showing you what books are in a library. There are at least two cards for each book - an author card and a title card. Why is there need for more than one card? Useful information about a book is written on each card. On page 491 in Warriner's what information did you note about a book? Sometimes there is a subject card. Of what use is the subject card? Quite often the subject is written in red to distinguish it as a subject card. Why is this important? Read on page 493 about cross-reference cards. What are they? Explain the difference between the two kinds. Are cross references the same in all libraries? Why?

Check page 494 in Warriner's and assign some of the exercises. Stagger the assignments so all the students will not be trying to work on the same problem in the same place at the same time.

PRACTICE EXERCISES

1. Ask the students to write catalog cards for the following book:

> E. B. White wrote a book of ninety-five pages on composition which he called Elements of the Language. It was published in 1959 by American Book Company of Chicago. Mr. White's Cutter number is 83. The book includes a bibliography.

AUTHOR CARD

```
 400
W83e        White, E. B.
                 Elements of the language.
            Chicago, American Book Company,
            1959.
                 95 pages
                 bibliography

            1. English language - composition
```

TITLE CARD

```
 400        Elements of the language
W83e        White, E. B.
                 Elements of the language.
            Chicago, American Book Company,
            1959.
                 95 pages
                 bibliography

            1. English language - composition
```

SUBJECT CARD

```
 400  English language - composition (in red)
W83e        White, E. B.
                 Elements of the language.
            Chicago, American Book Company,
            1959.
                 95 pages
                 bibliography

            1. English language - composition
```

2. Arrange these books in the order they would be shelved by numbering them from 1 to 10.

375 616c	371.6 619d	759 D56c	973.6 A33o	435.6 C96e
435.6 D19c	517 F86a	759.3 B16g	109 W32h	516.9 D75g

EVALUATION

Underline the correct answer to complete each statement.

1. The quickest way to find out whether the book entitled The Red Pony is in the library is to look in the card catalog drawer marked:

   (1) S - V
   (2) Q - S
   (3) O - Q

2. The classification number on the back of a book is the symbol of the

   (1) subject
   (2) title
   (3) author

3. The quickest way to find the page on which a certain topic appears in a book is through

   (1) the appendix
   (2) the index
   (3) the table of contents

4. To find the title of a book written by Henry Wadsworth Longfellow, look in the card catalog under

   (1) Henry
   (2) Biography
   (3) Longfellow

5. To find a biography of Henry Wadsworth Longfellow look in the card catalog under

   (1) Longfellow, Henry Wadsworth
   (2) Biography
   (3) Longfellow, Henry Wadsworth (in red type)

6. The table of contents is a list of chapters arranged

   (1) as they appear in the book
   (2) by no special arrangement
   (3) alphabetically by first word

7. Individual biography is arranged alphabetically by

   (1) person written about
   (2) title
   (3) author

8. The guide to the date of the content of books is called

   (1) imprint date
   (2) copyright date
   (3) publication date

9. Fiction is arranged alphabetically on the shelf by

   (1) author
   (2) subject
   (3) title

10. To find out what books the library has about China, one should first

    (1) look among the geography books
    (2) consult the card catalog
    (3) ask another student

11. The system in general use for classifying books is called

    (1) Dewey decimal system
    (2) expansive system
    (3) Library of Congress system

12. Nonfiction books in a library are grouped by

    (1) subject
    (2) size
    (3) title

Lesson Six
The Readers' Guide to Periodical Literature

A class set of free pamphlets entitled "How to Use the Readers' Guide to Periodical Literature" may be ordered from H. W.Wilson Company, 950 University Avenue, Bronx, New York, 19452. The teacher should study carefully the introductory materials on pages 1 to 5. Questions and problems are listed on pages 12 and 13. The teacher should adapt these to fit her class situations.

SUGGESTED ACTIVITIES

1. The students should make a list of the magazines in the high school library that are indexed in the Readers' Guide.

2. The students should be able to write the abbreviations for the months of the year.

3. Practice answering question 8 on page 12. Then ask the students to find a subject entry in the booklet that has at least three items. Copy the items and "translate" them into bibliographical form.

   Following is a subject entry:

   BICYCLES
   Look what's happening to bicycles. A. Wall.
   il Pop Sci 187:108-11 + Ag '65

   Following is a translation:

   Wall, A. "Look What's Happening to Bicycles," Popular Science, vol. 187 (August, 1965), pp. 108-111.

4. If arrangements can be made with the librarian, bring Readers' Guides into the classroom and let the students work in groups to prepare bibliographies of magazine articles on subjects they choose. Be sure each group uses more than one Readers' Guide in preparing the assignment.

NOTEBOOK ASSIGNMENT

Let the students decide in a class meeting the items from this assignment which they all will include in their notebooks. Of course, each student may add whatever he wants to his notebook assignments.

EVALUATION

1. Study the vocabulary words with the students so that all the students have accurate definitions for their notebooks.

2. Ask the students to write at least two sentences telling how he feels he will benefit from knowing how to use a Readers' Guide.

3. As a follow-up to this lesson the teacher may want to tell the students about the Vertical File.

4. A visit to the library for a question-answer period with the librarian would be appropriate now. The students have studied library skills so that they can ask questions and benefit from the answers.

Lesson Seven: Reference Books

The discussion of reference books can be done after a visit to the library because the students will have some knowledge of where the books are and how they are used. Arrangements should be made with the librarian so that the students will feel free to browse in the library while searching for answers to the questions.

The students and the teacher should make an annotated bibliography of the reference materials in the library. The annotations should include the place of the index in the reference books.

This would also be a good time for the students, in a club meeting, to formulate rules of behavior in using the library. Try to lead them into talking about understanding an assignment before going to the library; about asking questions of the librarian; about returning books as soon as they have finished using them. Remind them of the rules they formulated earlier for taking care of books.

Lesson Eight: Dictionaries

The questions that are used to motivate this lesson can be answered by using the "Popular Library Pocket Edition" of Webster's New World Dictionary of the American Language. If another dictionary is used, the teacher should check the answers before presenting the lesson.

The students will probably note the following items of information about a word that may be found in a dictionary: (Their wording may not be the same as yours, but you can insert the correct wording for their definitions and thus teach the vocabulary words.)

1. main entry or spelling in black type
2. pronunciation or respelling
3. part-of-speech label
4. irregular inflections (plurals, tense, participles, etc.)
5. definitions (Be sure to note the order of the meanings)
6. etymology, or origin of the word
7. derivations (words derived from the entry word by the addition of a suffix)
8. synonyms, antonyms and synonym studies
9. usage notes

The exercises that are used to practice the skills in using the dictionary could be worked out by the teacher and the students. Following are some suggestions the teacher may mention and the students may add to:

1. Writing sentences using homonyms, as fair, fare.
2. Writing the symbols for vowel sounds that may be spelled the same, as great, leave or hop, hope.
3. Writing the symbols which the dictionary gives for consonant sounds as in "change," "great"

4. Dividing words into syllables

5. Using words to illustrate their uses as different parts of speech

6. Practicing writing dictionary definitions in your own words

7. Dividing words into prefixes, stems, and suffixes.

8. Noting inflectional forms: comparison, plural, possessive, participle, tense

9. Noting derivations and their part-of-speech labels under main entries

10. Noting interesting etymologies of words.

If it is convenient, the attention of the class should be called to the differences between the unabridged and the abridged dictionaries. This should be done by demonstration with extra copies of unabridged dictionaries. This explanation would be useful in working out some of the exercises above.

SUGGESTED ACTIVITIES

1. Ask the students if they would like to prepare dictionaries of their own. Help them to recall that on their trip to the library the librarian pointed out different kinds of dictionaries based on subject matter, as Dictionary of Technical Terms, Dictionary of Slang, etc. You could tell them how language changes and how words get into dictionaries. For example point out definition No. 8 of the word square in Webster's New World Dictionary and then look at definition No. 8 in Webster's Seventh New Collegiate Dictionary. A slang word because of usage is now standard English. There are a number of subjects that the students will be interested in - cars, home, food, clothes, school - that they have their own language for. One example could be "Kinds of Dances." They could name dances that they know now or have heard of. They would have fun asking older members of their families the names of dances and then finding definitions of these dances in their dictionaries. These dances would include Waltz, Cha-Cha, Twist, Jitterbug. The names of the newer dances like Funky-funky Broadway, Frug, Skate, Watusi, Shing-a-ling, Flounder Stomp, Push, Jerk, etc. The students will write their own definitions of the new words. As writers of dictionaries, the students become lexicographers. In their groups they may appoint phonologists to write pronunciation, orthographers to spell the words correctly, tabulators to alphabetize, grammarians to suggest usage labels, inflectional forms and parts of speech, etymologists to give the origin of the word, illustrators to picture the words, researchers to check to see if the word is already in a dictionary, and clerks to make card files of the words. (All the cards in the class may be collected and a dictionary of teen-age language could be "published.") All the students should have a part in writing the definitions. The decisions of the subgroups on spelling pronunciation, etc., should be submitted to the group for acceptance. The booklets may be done by hand or if the project proves worthwhile, the material may be dittoed so each one may have a copy of his own. This could be a continuing project in that materials may be added anytime the students are studying language or vocabulary building.

2. Report orally on the unusual histories of some of the words they hear or meet in their individual reading.

3. Bring to class examples of familiar words used in unfamiliar contexts.

4. Clip unusual words or references to words in the comics in newspapers.

5. Rewrite phrases using different levels of usage.

6. Make a card index of "word families."

7. Find examples in their textbooks, trade manuals, or special interest magazines of words in general use that have specialized meanings in certain vocations or fields of interest.

8. Replace words in context with synonyms. This would be an excellent opportunity to introduce A Dictionary of Synonyms and Roget's Thesaurus.

9. Give the students practice in trying to decide the meaning of a word by its use in context and then checking their ideas with dictionary meanings.

VOCABULARY

A. Definitions

1. student: (a) a person who studies or investigates
(b) a person who is enrolled for study at a school or college

2. pupil: a person, especially a young person, who is being taught under the supervision of a teacher or tutor, as in school

3. scholar: a learned person; one trained in a special branch of learning, as literature, arts, etc.

4. knowledge: (a) acquaintance with facts; range of information, awareness, or understanding
(b) all that has been perceived or grasped by the mind; learning, enlightenment
(c) the body of facts accumulated by mankind

5. wisdom: (a) the power of judging rightly and following the soundest course of action based on knowledge, experience, understanding, etc.
(b) learning; knowledge; erudition

6. insight: the ability to see and understand clearly the inner nature of things

7. teach: (a) to show how to do something; to give instructions; to train
(b) to provide with knowledge, insight, etc.

8. train: to instruct so as to make qualified; as, nurses are trained at this hospital

9. educate: to give knowledge or training to; train or develop the knowledge, skill, mind, or character of, especially by formal schooling or study; teach; instruct

10. education: the process of training and developing the knowledge, skill, mind, character etc., especially by formal schooling, teaching, and training

11. vocation: (a) the function or career toward which one believes himself to be called
(b) the work in which a person is regularly employed

12. avocation: something one does in addition to his vocation or regular work, and usually for fun

B. Questions: Students may write the answers in their notebooks

1. What is the basic difference between a pupil and a student?

2. Can a student be a scholar? How do you know?

3. If you were referring to your knowledge, which of the three definitions would apply?

4. Can a person have knowledge but lack wisdom? How do you know?

5. Is it possible for a person to have more wisdom than knowledge?

6. Which is closest in meaning to "common sense," wisdom or knowledge?

7. Can a person have insight but lack knowledge? Can he have insight but lack wisdom?

8. Of the three definitions of the word teach, which one is most important in your opinion? Why? Which one is the easiest to carry out? Which would be the most difficult? Why?

9. What is the difference between train and teach? Which of the two diagrams below is a more accurate representation of the relationship between train and teach?

A

train	instruct	guide
show	help	lead

B

Teach	=	Train

10. Why do you think there is no mention of "wisdom" or "insight" in the definition of educate?

11. What do we mean by referring to a person as "self-educated"?

12. Why is education defined as a process?

13. Note definition of vocation: Is it possible for a person to work regularly at a specific job but yet feel no particular "calling" for it? What is the advantage of feeling "called" to do a certain type of work. What would be some indications that a person had been "called" to a special type job? Do you feel inclined or called to do a certain type of work?

14. Do you have an avocation? What is it? You may have several. List them below.

EVALUATION FOR STUDENTS AND TEACHER

1. If a word is spelled several ways, which is the right way?

2. Find alright and ain't in your dictionary. How do you account for their being in the dictionary?

3. When you ask someone how to spell a word, and he answers, "Look it up in the dictionary" why do you feel confused and helpless?

4. Why do people who read widely usually develop large vocabularies?

5. What is meant by "learning words by context"?

6. Give examples of words containing a schwa for different spellings as, circus, about.

7. How do words get into a dictionary?

8. Why do we need an unabridged dictionary in our classroom?

NOTEBOOK ASSIGNMENT

Check to see if the students are keeping their notebooks in an orderly manner. Let the students ask questions about the form they use in writing definitions of the vocabulary words. You may ask for sentences using the vocabulary words if you feel practice is needed for clarification of the meanings of some of the words.

PRACTICING PARLIAMENTARY PROCEDURE

An Approach to Teaching Parliamentary Procedure

Parliament comes from the French word parler, which means "to speak." Conducting meetings according to parliamentary law comes to us from England and can be traced back to Roman law. Parliamentary procedure is the code of rules for working together in groups.

Parliamentary rules have grown naturally out of certain basic ideas or principles, which are in harmony with our democratic ideals. Because we believe that power resides in the people of a nation, or of a club, or of a class, we determine majority opinion by vote and then abide by the rule of the majority. We try to make sure that everyone who wishes to do so has a chance to express his views in our meetings because we believe that our citizens are equal in rights, privileges, and duties. To carry out this principle, order must be preserved and members must be courteous. Although we abide by the rule of the majority, we still feel that the minority should express their views freely if they speak in order and one at a time. Decisions are made by allowing all participants to vote. The responsibility then rests on individual members who make up an organization. Therefore, one of the most important skills that we develop during our high school days is a knowledge of the importance of using parliamentary procedure.

The outline in the Student Lessons is a simple one. Drill exercises should be given frequently until all students are familiar with how a member secures the floor and makes a motion. (The wording of the main motion is further discussed in Lesson Two.)

An English Club should be formed so that a realistic situation exists. Under the guidance of the teacher, the students may practice making pertinent motions, asking for discussion, and putting the question. Subsidiary motions should be defined and illustrated during the periods for discussion. (These are discussed in Lesson Three in the Student Lessons.) Reading assignments should be made in the booklet, The How in Parliamentary Procedure, and class discussion should follow.

If there is time, each student should have an opportunity to preside, to read the minutes, or to make a committee report. The actual participation - making motions, discussing, and voting - should be done spontaneously.

Careful attention should be given to the understanding of the post-test on parliamentary procedure in Lesson Five in the Student Lessons. If the students can be motivated to write on "What America Means to Me Today," the written exercise can be profitable and the writings could be collected for a booklet of creative writings and kept on file for use in eleventh grade classes.

A discussion of VICA might be appropriate at this time. Membership in any club should be based on an individual's desire to participate and to develop leadership. Students enrolled in vocational classes are eligible for VICA and can through positive group participation develop ideals and set goals that go with them into the work world.

NOTE: Any unit on parliamentary procedure should be considered a continuing unit and practice in developing the skills of securing the floor, making a motion, and discussing the motion should be practiced in homeroom, classroom, and club activities.

IMPROVING ATTITUDES

You may need to explain to the students the significance of the title of this unit. Try to do this inductively by letting the students recall times they have heard the word used. They probably have hazy ideas which you should be ready to crystallize for them. In some way lead the discussion to personal relationships. Help the students understand the discussion of the word persona from which the word person comes.

From the discussion of persona you can bring up individualism and the need for everybody's taking a personal inventory. Hopefully all the students will participate in the activity of describing their strengths and weaknesses. You may or may not look at the papers. You can decide on this as you see how the students are responding.

The following inventory sheets should be dittioed for the students. Probably some of the ideas need to be deleted and some ideas added.

Allow time for the discussion questions. This will probably be a serious discussion by the students if they have done the inventories thoughtfully. Some may express themselves awkwardly. Try to give all questions and answers your personal recognition.

1. Ask questions about the words you do not understand. Check (✓) those you think apply to you. Place a plus sign (+) by those traits you would like to acquire, and place a minus sign (-) by those that sometimes apply to you.

   I am

   1. cheerful
   2. sad
   3. inattentive
   4. often an absentee
   5. timid
   6. not above telling little white lies
   7. a mild gossiper
   8. a good listener
   9. late for many appointments
   10. sensible
   11. not a snob
   12. jealous of my friends
   13. contented with most things
   14. sick most of the time
   15. easy going
   16. a loner
   17. generous with my possessions
   18. a perfectionist
   19. agreeable

20. a safe driver
21. critical of my family
22. a borrower
23. a procrastinator
24. a pretender
25. friendly to new acquaintances
26. conscientious all the time

II. Under the proper headings record your reaction to these words:

	Like	Dislike	Fear	No Feeling
1. Dances				
2. Freedom				
3. Democracy				
4. Reading				
5. TV Commercials				
6. Fire				
7. War				
8. Football				
9. Foul language				
10. Deep water				
11. Dentist				
12. Poverty				
13. English				
14. Cancer				
15. Parents				
16. Camping				
17. Chores				
18. Country music				
19. Baseball				
20. Listening to the radio				
21. Travel				
22. Birthdays				
23. Christmas				
24. Police				
25. Parties				
26. Newspapers				
27. Being alone				
28. Modern art				
29. Gossip				
30. Indoor activities				
31. Sleeping				
32. Crowds				
33. School				
34. Books				
35. Teachers				
36. Manners				
37. Elections				
38. Vacations				
39. Elderly people				

LOOKING TOWARD A CAREER

This unit should grow gradually from a discussion of attitudes and personality. Quite often students begin to reveal their ideas in such a way that their philosophy of living is made known. A discussion of philosophy leads naturally into answering questions about what one wants out of life.

Lesson One: Recognizing Your Personality

The written assignment, which the children will probably be interested in because it is about themselves, could be used as a springboard for some careful instruction in composition and revision. Grade the papers carefully. Use the red pencil to mark the good ideas; use a student's pen for marking errors in coherence or whatever you decide especially to stress at this time. Keep the written materials and the revisions of such materials in the students' individual folders.

Lesson Two: Projecting Yourself into a Work Situation

Be as helpful as you can in guiding the students in selecting materials to read on the various occupations. Be sure the students understand that this is an assignment in exploring the possibilities of several careers. You could stress the importance of looking into the potential of several occupations before deciding on a job. The thought questions should provide interesting discussions. Some personal stories of misfits would emphasize the need for these lessons.

Lesson Three: Planning Your Career

This assignment may serve as a book report if such reports by students are required. The outline in the student manual is merely a suggestion and should be amended to fit your particular classroom situation.

Lesson Four: Identifying Yourself in a Work Situation

This assignment may also serve as a book report. The lesson is included here because of continuity of ideas on the importance of one's identifying himself with an occupation and working towards achieving success in the occupation.

You may have a student chairman for the oral discussions after you are sure the students understand the problems portrayed in the stories. If they can write good sentences identifying the problems, then they can communicate with their classmates in talking about the problems. (See the book list in the Supplement and the reading record in the Student Lessons.)

READING NEWSPAPERS

This teaching module should be considered merely as an introduction to the reading of a newspaper. The ideas of propaganda and separating fact from opinion should not be introduced unless the students ask questions. In the eleventh grade more sophisticated skills of understanding news media will be introduced. The teacher may want the students to work in groups to share materials and ideas. Some plan could be formulated for putting the assignments into the regular class notebooks or making separate booklets. During the evaluation period if there is enough interest exhibited by the students, a small class newspaper can be planned as a creative project. The finished project should be dittoed so that all the students have a copy.

Lesson One: The Front Page

Prepare for the handling of the materials - newspapers, scissors, paste - in a convenient way so that the students assume the responsibility each day for keeping the classroom neat.

After the discussion of the questions that are answered in the leads of stories, the teacher may write on the board the following:

A Newsman's Text

"I have six honest serving men.
They taught me all I know.
Their names are Where and When
And What and How and Why and Who."

-Rudyard Kipling

The following material may be used for a note-taking and listening exercise. The ideas should be rearranged to fit the results of the class discussion on leads. The lead is the summary of the story. The lead may be,and most often is,just the first sentence. In a long,complicated story the lead may run to two, three, or four paragraphs. The lead can make or break the story. It sets the tone of the story at once and puts the essential information quickly before the reader. Primarily the lead is written for the hurried reader. The lead itself is simple. All you have to do is answer Mr. Kipling's questions. To this list you will want to add one more question: Who says so? The lead is the briefest possible summary of the story.

Spend as much time as interest warrants on headlines and leads and front page news. You might ask this thought question: What is the meaning of the word important when it is related to a news story? Ask the students to recall Lesson One: The Student Handbook where the directions - north, east, west, and south - are in the reading material. They will note the initial letters - N E W S.

Lesson Two: The Editorial

The students will need guidance in understanding the ideas in the editorials. If there is time, the teacher in preparing for this unit could have noted some good editorials and cartoons for tenth-grade students to discuss. Clip from newspapers cartoons that do not have captions. Let the students suggest fitting captions. These could be used for bulletin board material.

Lesson Three: Other News Items

This lesson may be used as an oral discussion or as group work to conserve time.

Lesson Four: The Sports Story

The students may be interested in discussing sports newscast and televised sporting events in connection with reading sports stories in newspapers.

Lesson Five: Advertisements

Try to lead the students into reading some want ads that pertain to jobs they can do part time or in the summer or jobs that they will be interested in after high school. The students will probably be interested in the wording of other kinds of advertising in the classified section of the paper. Questions, answers, and sharing by reading aloud would be a relaxing break for them.

SUGGESTED QUESTIONS FOR STUDYING WANT ADS

1. What salary is noted in the ad?
2. What are the job benefits?
3. Is the title of the company given? Is it a reputable company?
4. Tell why you would or would not answer some of the ads.

Lesson Six: Summary and Evaluation

ACTIVITIES

Set up a dummy for the front page of a newspaper. Use the blackboard. Discuss and decide on seven or eight headlines that would serve as a springboard for current news items. The items could refer to local, state, and/or national news.

Prepare a vocabulary of words one should have in his speaking vocabulary when he is discussing newswriting. Practice using some of the words when you make oral reports on newspapers.

Ask Mr. Fred Graham, head of the journalism department, to talk to you about writing news stories and taking pictures that "tell" stories.

If it is convenient, this will be an opportune time for a visit to the print shop on our campus.

A visit to the Arkansas Territorial Restoration to see the first printing press used in Arkansas and then a visit to a local newspaper publishing company would be most interesting at this time.

The students will be interested in the comic strips. Some comic strips represent very careful writing.

If the teacher has a collection of news pictures from The Associated Press, or a comparable agency, she may ask the students to supply captions for the pictures and then write headlines and leads for appropriate news stories. The students may compose a story orally by suggesting sequential sentences. The story may be written on the board and then revised by the students so that it is more effective.

The preceding activity would be a good one to summarize testing the adequacy of a lead and the effectiveness of the vocabulary in the story.

The above activities may or may not fit into the teacher's schedule. A teacher-planned test may be needed at this time for evaluation purposes. The students should be involved in some kind of activity as an outgrowth of the learning experience. The students may enjoy attempting to make up a test for this unit.

APPLICATION: DISTINGUISHING BETWEEN FACT AND OPINION

Materials: The literature textbook, Perspectives, pp. 530-540
Guidebook for Perspectives, pp. 52-56
Tactics in Reading II, Cards 21, 22, 23, 24A, and 24B

Purpose: To help students discriminate between statements of fact and statements of opinion as an introduction to critical reading

Method: Follow the helpful suggestions given in the Guidebook for Perspectives, p. vii

IMPROVEMENT OF READING

The Division of Secondary Education of the Los Angles City School Districts gives its teachers an inventory sheet to help each teacher to understand that he or she is teaching reading. Most teachers have the idea that the teaching of reading involves drill and a formalized program of instruction. A check of the following inventory indicates that all teachers are teachers of reading.

In your teaching, do you help students learn through these experiences? Check those you develop.

___Listening

___Graphic and concrete experiences for understanding

___Oral use of new words

___Word recognition

___Vocabulary building

___Comprehension

___Selecting main points

___Using textbook aids

___Using supplementary books

___Alphabetizing

___Using the dictionary

___Selecting correct definitions

___Adjustment of reading rate to purpose

___Enjoyment of reading

___Accuracy in reading

___Following directions

___Reasoning

___Use new words in writing

___Fact recall

___Evaluation

___Critical analysis

___Integration of new ideas

___Forming sensory images

___Making comparisons

___Organizing ideas

___Making generalizations

___Summarizing

___Recreational reading

Reading of:

___Schematic diagrams

___Graphs

___Figures

___Charts

___Maps

___Pictures

___Cartoons

___Symbols

___Working drawings

If, in your classes students are learning some of the above,

YOU ARE TEACHING READING!

All teachers recognize that there is a need for teaching techniques for improvement of reading in most secondary schools. Although listening, reading, and speaking activities can be carried on in the regular classroom with the use of the tape recorder and the record player, it is difficult to conduct remedial work and many reading improvement exercises without interrupting the continuity and the rapport of the learning situation. On the other hand, we are agreed that there is a definite need to identify the weaknesses in the reading skills of tenth grade students who will go into the work world upon graduation from high school. In this curriculum which we are trying to build on the interests of the students, we are providing time for free reading periods. Paperback copies of books on many subjects and various magazines are available for browsing and reading. The students are not asked to make formal book reports but are given opportunities to discuss ideas that grow out of their reading. The vocational students have read and discussed easy materials that help them to project themselves into work situations. (See teaching module, "Looking Toward a Career.")

Tests may be given to help the teacher decide whether time should be allotted to concentrate on the improvement of those reading skills in which the students are deficient. Suggested tests to use are Gates Reading Test and the reading skills section of the Iowa Test of Educational Development. If it is at all possible, each student should be allowed to progress at his own rate in whatever program is chosen to develop improvement in reading skills.

Following is a suggested list of reading improvement programs. The titles marked by the asterisks are the materials that have been used for this project.

*1. Pooley, Robert C. and others. Perspectives. Glenview, Illinois: Scott, Foresman and Company, 1963.

Perspectives is the tenth grade literature anthology of the Galaxy series designed to improve reading. The teacher's Guidebook is very good and there is a Tactics box containing interesting individualized drill exercises to develop particular reading skills such as "making judgments." This is the adopted literature text for tenth graders in Metropolitan High School. Most publishers of literature anthologies provide a program similar to the Galaxy series for the basic learner.

2. Learning 100. Huntington, New York: Educational Laboratories, McGraw-Hill, 1967.

The complete program consists of various machines - Controlled Reader, Flash-X, Tach-X, and Aud X - that should be set up in a reading laboratory setting. Individual machines, such as Aud-X or the Controlled Reader, could be used in an English classroom to improve certain reading skills.

3. Reading Improvement Program. Camp Hill, Pennsylvania: Book-of-the-Month Club

   This program, sponsored by Rutgers University, is designed to help individuals to increase their reading speed and to improve retention of what they read. It is mentioned here because business and industrial companies are finding the program practical for individual improvement in reading.

4. Comprehensive Reading Program Through Visual Learning Systems. 6767 Southwest Avenue, St. Louis, Missouri 63143: Perceptional Developmental Laboratories.

5. Science Research Associates, Inc., 259 East Erie Street, Chicago, Illinois 60611

   Among the titles of the reading improvement programs are Reading in High Gear and Dimensions in Reading.

6. Sullivan Reading Program. Box 577, Palo Alto, California 94302: Behavioral Research Laboratories.

   This is a set of programmed textbooks for individual instruction.

*7. Guidebook to Better Reading. Oklahoma City, Oklahoma: The Economy Company.

   This program is designed to develop word-attack skills, to develop sight vocabulary, and to sharpen comprehension skills. The teaching manual is an adequate guide to achieving improvement of reading skills for the teacher who feels she is not a reading teacher.

*8. Holt's Impact. New York: Holt, Rinehart and Winston.

   This is a sequential series designed for the student whose progress in school has been impeded by his environment and not necessarily by a lack of intelligence. An attractive feature is a set of paperbacks, five copies of ten titles that are related to the subject of the book that is studied in depth by all the students. The experimental groups chose the title At Your Own Risk for their reading enjoyment.

9. The Reader's Digest: Reading Skill Builder. Pleasantville, New York: Reader's Digest Services.

   The Reading Skill Builder's series are designed to provide students with worthwhile basic or enrichment materials. The materials are high in interest appeal and are varied in form and matter. Provisions are made in the presentation of materials for individual materials.

READING DEEPLY FOR MEANING

Sometimes the teacher and the students will want to delve more into the meaning of a story they are all reading or that groups are reading. The students sometimes tire of discussing theme, plot, and setting as such. They like to relate their reading to themselves, and surely they need to if their reading is to be enjoyable and meaningful.

The following suggestions have been gleaned from experiences in teaching, sharing experiences with other teachers, and from Reading Ladders for Human Relations, edited by Muriel Crosby and published by American Council on Education.

I. Rather than a summary of the whole story, ask the students to think about the story and name and tell about incidents or situations that are clearest in their minds.

   A. Ask students to read aloud passages from the incident that give it meaning.

   B. The students may bring to class musical recordings that seem to be background music for the story.

   C. They may cut pictures from the papers that illustrate the story or they may draw their own illustrations.

   D. Through discussion, decide what the author is telling us in this incident. Could this be the theme of the story - the main idea that the author is presenting? Then when the class defines the theme, discuss how the author uses his tools - plot or action, characters, setting, and language - to present his main ideas.

II. If the teacher decides that the story is a good one for character study, the following questions may help:

   A. What does the character do in the story? Why did he do what he did?

   B. In what ways does the character show his feelings? Has there been a change in his feelings in some way?

   C. How do you feel about what the character did? How would you have felt if you had been in his situation?

III. Generalize about incidents that have the same emotional experiences that you have either read about or experienced. Discussion could begin with:

   A. Have you ever seen something like this happen? When? Where?

B. How were the incidents alike or different? Think before answering so you can be specific in your answers.

IV. Explore and question the consequences of certain behavior and/or feelings.

A. Identify the consequence.

B. What action or feeling led to the result?

C. How were other people affected by the consequences of one character's actions? Are they made happier or are they placed in more difficult situations?

WRITTEN ASSIGNMENT

If you could relive one of your own experiences, what would you do differently? Why? What would you do to make the situation different?

SUGGESTED BIBLIOGRAPHY FOR TEACHING READING IN THE ENGLISH CLASSROOM

Crosby, Muriel, editor. Reading Ladders for Human Relations. Washington, D. C.: American Council on Education, 1966.

READING LITERATURE: UNDERSTANDING POINTS OF VIEW

The discussion on distinguishing between fact and opinion has given the teacher an opportunity to introduce the students to a literature text called Perspectives. The Guidebook and Tactics II to accompany the textbook are valuable aids for the teacher. The sequence of presenting the materials in this unit is merely a suggestion. The different teaching modules may be altered to fit individual classroom needs.

The approach to literature should be social rather than literary. This is based upon the realization that all affective literature is related to life in the same way that a portrait is related to its subject. The aim in reading literature should be "to have one foot in literature and one foot in life."[1]

Lesson One: Understanding Differences in Points of View

ASSIGNMENT

The students should have read the story, "Without Words," in Perspectives, pages 92-100, before coming to class. The teacher may refer to the Guidebook, pages 31-36.

APPROACH

Judgments reflect differences in the viewpoints of readers. There are reasons why viewpoints change. Sometimes our viewpoints may be deliberately influenced by other people. Certainly our background experiences influence our thinking, our actions, and, consequently, our judgments.

NOTEBOOK ASSIGNMENT

Be sure to allow plenty of time for class discussion before asking the students to write their conclusions.

Lesson Two: Listening and Discussing

APPROACH

The students may read silently "A Man Who Had No Eyes" in Perspectives, pages 101-104. Answer as many of the questions as the students seem interested in. Ask the students to note the contrasts in the two men's appearance, actions, and attitudes and to decide whether conclusions may be reached on situations that can influence one's point of view. The conclusions may be added to those already recorded in the student notebooks.

---

[1]Murray Bromberg. Making Literature Lessons Live. Prentice Hall, 1961, p. 9.

Read "Best-Hated Man in Town" on pages 104-108 aloud to the students. Read the first two paragraphs and stop to emphasize who is telling the story. (Note the briefness of the first paragraph and the parenthesis in the second paragraph.) Continue reading aloud with expressive emphasis on the examples of grouchiness exhibited by George Beebe and the reaction of the townspeople to his goading of them.

DISCUSSION

Relate the title "Best-Hated Man in Town" to the character traits of George Beebe.

Discuss the meaning of the one word "Best-Hated" as a combination of two antonyms: good and bad.

Lead students into a discussion of the influence of an individual in a community.

You may ask: If you were a George Beebe, what needed changes are you aware of in your community that you would like to mention?

Lesson Three: Time Changes Ideas

The poem "Sea Love" by Charlotte Mew on page 111 shows how time can change one's idea of love. "About Crows" by John Ciardi on page 118 emphasizes the differing of the opinions of the young and old. As one grows older his ideas change. The students can be led into discussions of how their ideas of vocations have changed and are still changing. The only thing we can be sure of about change is that there sill be change. Life does not stand still.

EVALUATION

The characters we have studied are individuals as all of us are. You have written two-sentence biographies of some of these characters: George Beebe, Jan, the two crows, Joe, Mr. Parsons, the peddler, and Mathieu. Now let us try to determine the attitudes that identify the characters by answering two questions: Which characters showed attitudes that were based on reasoning? Which characters based their opinions on their emotions? Be specific in your answers by citing examples from the stories and poems you have read.

These discussions should help the students to understand how difficult it is to separate fact from opinion, whether one is the writer, the speaker, or the listener.

READING LITERATURE: MAKING INFERENCES

APPROACH

The material in the textbook Perspectives on pages 562 and 563 may be used to help the students define inferences. Of course, we must understand an author's ideas that he states outright, but the good reader must become aware of ideas which the author suggests or implies.

Card 35 from Tactics II would be an apt follow-up of the pictured clues in Perspectives. If the teacher wants to relate the reading of literature to advertising in the mass media, she can ask the students to look at advertisements and listen to radio and TV commercials. These questions may be asked: To whom was a particular advertisement meant to appeal? How do you know? The Tactics Cards on inferences from what the author tells you, from conversation, and from actions could be presented before the study of characterization which is presented in the student lessons.

Lesson One: A Study of Contrasts

The students will easily understand that characters are people if they have learned to project themselves into what they read. Relate problems to people. Help the students decide on subject categories for identifying problems. Then if the discussion can be turned towards identifying human traits that may cause or be the result of personal problems, you will be leading the students towards their writing assignment for this lesson.

Take plenty of time to note the evidences of contrasts that can be useful in determining character traits that distinguish one person from another.

WRITTEN ASSIGNMENT

Try to help the students understand that they want to identify one main trait of the person they choose to write about. The mention of ideas about other traits should support the main idea. Help them to write descriptions, anecdotes, and conversation that delineate the trait. The story "Grandfather Tower" by Glenway Wescott is a good example of the writing described above. Grandfather Tower's impatience is pointed out in each section of the story which is also coherent because of the time sequence used to relate the story. Make your explanations to the students for the writing of the composition as clear and simple as possible. Then let the students write in class. They may begin by thinking about a person and jotting down all the ideas that come to mind as they think. Do not be too critical of the students' attempts. Try to help them devise ways to emphasize a single trait.

READING LITERATURE: FINDING THE CENTRAL IDEA

The teacher may easily relate the skill of finding the central idea when reading to the previous writing assignment. Sometimes one also has to read between the lines to understand an author's main idea.

The unit "Spaceways" in Perspectives because of its timeliness will appeal to the students. Use as much of the material available in the text and in the handbook as there is time for or there is indiciated interest. See the Guidebook for Perspectives, pages 103-126, for suggested methods.

The reading of the stories and articles will provoke discussion and curiosity. This will probably be a good time to give the students practice in using the tools for research which have been previously introduced. If there are any types of reports as a result of class interest, they should be brief. Insist that the students use exact terms in making their reports or giving information.

APPLICATION AND IMPLEMENTATION

Companies in business and industry publish attractive brochures containing descriptive materials about various tools, jobs, and machines. This material may be placed in the classroom for the students to browse through. Ask each student to select a job description or a tool description and explain it to the other class members. The purpose of this assignment is to impress on the students that when articles are known by particular names they should not be referred to in terms such as "thing-um-bob."

READING LITERATURE: IMAGERY AND FIGURATIVE LANGUAGE

Lesson One: Inanimate Objects as Images

The teacher should help the students relate what they read to their senses. You are helping them to read with meaning if you can convey to the students that words are meaningless and, in a sense dead, until a reader lifts them from a page and projects them into a world of relevancy.

Since the backgrounds and experiences of people are different, we do not all see the same sensory images when we look at the same objects. You can illustrate this by saying isolated words like car, chair, flower, city, etc., and asking the students to note the different responses.

Use as much of the material in Perspectives, pages 587-598, and the Guidebook, pages 176-177, as you can without losing the students' interest. Get suggestions from the students for some exercises and let them work with each other until they seem to understand imagery.

The story "Papa and the Bomb" is very interesting and the students should enjoy reading it under their own momentum.

The discussion on inanimate objects could be opened with the students' recognizing that we live in a world of things - some useful, some necessary, some unnecessary. The implications of inanimate objects are varied as the students will discover for themselves.

WRITTEN ASSIGNMENT

You may ask the students to write different messages that Papa could have placed in his "bomb." The writing will give you a clue to the depth of their thinking.

Lesson Two: Recognizing Figures of Speech

With the help of the students, probably the teacher should define figurative language. A dictionary definition is not adequate. Before using the exercises in the book on pages 540-549, ask some simple questions that require the students to describe a thing or an action such as the following: How fast did Billy run? How scared were you when you heard the explosion? How did you feel when you knew you were locked in the building? Require that the answers be given in complete sentences. The students will discover that they need to express themselves in terms understood by their listeners or that they must use examples of known actions to be understood.

Refer to pages 72-76 in the Guidebook and to Tactics in Reading II, Cards 25, 26, 27, and 28.

READING LITERATURE: RELATIONSHIPS

APPROACH

The material in Perspectives on pages 574-585 should be carefully discussed with the students so that they clearly understand four kinds of relationships: time order, comparison-contrast, cause-effect, and simple listing. The students should become so familiar with these relationships that they consciously use one kind of relationship or a combination of relationships in the organization of their oral and written compositions. Refer to the Guidebook, pages 152-154.

If more material is needed for drill work on relationships, the teacher may use Tactics in Reading II, Cards 39-43. These cards will be useful in refreshing the students' memories when they begin seriously practicing using different relationships in their writing later.

Lesson One: Relating Inferences and Relationships

ASSIGNMENT

Any anecdotes about O. Henry would be appropriate to introduce this story. Reading this story will give the students an opportunity to practice using the techniques for reading between the lines. Refer to pages 155-156 in the Guidebook.

Lesson Two: The Significance of Titles of Stories

APPROACH

Study the picture on page 351 with the students. Ask what inferences can be drawn from the headnote. Ask the students to read the story silently. Lead a general discussion of the story by letting the students talk freely among themselves and by raising questions. Lead them to the central idea of the story (a gamble against great odds). Then let them discuss the thought question in their exercises. Refer to pages 168-169 in the Guidebook.

Lesson Three: Relationships--Cause and Effect

"Frame-up" on pages 15-33 is a long short story that becomes a gripping detective story. Let the students define frame-up in their own language. Then begin reading the story aloud so that all understand the setting and situation of the story. Ask the students as they continue the reading to try to figure out what really happened on the highway and why it happened.

Lesson Four: Relationships--Comparison and Contrast

Carefully prepare the interpretative reading you will do for the students. Probably you should read the poem twice before letting them read silently for the deeper meaning. Many of them will understand the deeper meaning and should be given an opportunity to try to unearth the meaning.

Introduce "The Mate" by relating it to hunting. Hunting is an exciting and pleasurable sport for many. Read this poem for its meaning. The teacher may need to read the poem aloud to help the students to clarify the meaning. Ask which words forcibly bring out the contrasts of feeling as portrayed in the first and last parts of the poem. See pages 37 and 87 in the Guidebook.

INTRODUCTION TO LANGUAGE: DIALECTS

INTRODUCTION

An approach to the teaching of language to students may very well begin with an understanding of dialects. The definition of dialects in this teaching module is that a dialect is the language of a speech community. It is not a separate language; it simply differs in word choices, pronunciations, and grammatical construction from the same elements of language in another community. Dialects of people in the same community may differ if their backgrounds, environments, and traditions are different. A person's dialect may keep him from pronouncing words correctly, or shall we say in the usually accepted manner. Jenkinson says: "Each man's language differs slightly from that of his neighbors. His use of words, his grammatical constructions, and his pronunciation of some words are not exactly the same as his neighbors. Each man has an idiolect, i.e., each man has a speech pattern that sets him apart from his neighbors . . . . It's no disgrace to speak a dialect. Everyone does."[1]

APPROACH

The teacher will not relate the ideas listed above directly to the students. It will be better to let the students consciously listen for differences among the pronunciation and grammatical constructions of students and others. This teaching module should be presented to a class during a relaxed period of time. So often we English teachers feel that we must begin a school term with what we call a "good grammar review." We think that our students will write better compositions after we have corrected their grammatical errors. This is not necessarily true. The student improves his grammatical constructions as he succeeds in expressing himself about ideas that he has developed on his own.

If you can lead the student into believing that when he has something important to say, that he should want to express it in language that is understood by his audience, you are on the road toward leading him from using a substandard dialect to an acceptable dialect. When you recognize that the student has acquired the finesse of appropriateness of levels of usage, you know you have done an excellent job.

Lesson One: Listening for Dialect Differences

APPROACH

This will be a good time to give the students some relief from teacher-designed academic discussions by letting them discuss a topic of their own

---

[1]Edward B. Jenkinson. What Is Language? Bloomington, Indiana: Indiana University Press, 1967, p. 153.

choosing. We find that when people are discussing literary topics, they often use an artificial, stilted language. The purpose of this lesson is to get the students to speak naturally on topics of their interest. You may suggest to the students during one of their club meetings that they plan for a "conversation day" on some subject agreed on by the group. They may spend some time in wording various discussion topics so that everyone is agreed on a general definition and limitation of the subject. You know from experience that no topic can evoke good discussion until all have clearly in mind what the topic for discussion really is. I would let this be a continued lesson if interest in the group warrants this.

PROCEDURE

The students, directed by the teacher, will set up a format for the conversation--chairman, seating arrangement, methods for allowing and encouraging all to speak, etc.

The teacher who is in the background during the conversation period should interfere only if an argument ensues. Quietly explain that this is a conversation group and not a debate group. No one is in the group to settle a controversal matter or solve problems. The discussion is for learning and encouraging thinking.

The teacher or a student will record the conversations for the study of the dialects of the persons involved in the conversation. Play the tapes, stopping to note differences in pronunciations and in syntactical structure. Let the students question and discuss on their own while the teacher points out good examples like different pronunciations for fog, dog, get, etc.

If there are available recordings of the speech of well-known people, they could be played to emphasize further the differences in the dialectal expressions of people from different backgrounds.

TEACHER OBJECTIVE

The teacher will note sentences that represent different sentence patterns. The students will of course use many transforms, but you will use only kernel sentences for the next lesson. You may need to make up some more sentences to clarify your explanations of sentence patterns. Keep the sentences on the students' level and on the subject of the conversation.

KERNEL SENTENCES: THE NOUN PHRASE

Lesson One: Proper Nouns, Personal and Indefinite Pronouns

Either use the overhead projector or write sentences representing various sentence patterns on the board. As the students pick out the subjects and predicates, draw a vertical line separating the two parts of the sentence. A list of sentences illustrating the kernel sentences may include:

1. Joe worked in his shop.
2. The girl has cut her finger.
3. The boss is cheerful today.
4. This answer seems best.
5. A monkey wrench is a tool.
6. She is here.
7. Someone will work in the cafeteria.

Write NP over the subjects and VP over the predicates as,

NP	VP
Joe	worked in his shop.

PROCEDURE

Discuss the vocabulary for transformational grammar with the students:

A. Kernel Sentence

$S \longrightarrow NP + VP$

S = *sentence*
$\longrightarrow$ = *may be written as*
NP = *noun phrase*
VP = *verb phrase*

NOTE: A phrase may be a single word or a group of words.

B. Noun Phrase

NP = *proper noun, personal pronoun, indefinite pronoun, or Det + n*

1. To introduce the NP you may use the following idea: You may ask the students to write their names. Some of the students may write their names on the board. Ask, "Why did you use capital letters?" (Be sure to include in the reasons the idea of avoiding confusion: We gave the book to Sue and The man will sue you.) One way to recognize the proper nouns is by their being capitalized. Ask the students to write other proper nouns that are not names of people. List them on the board. Call their attention to the built-in the in some words that is not capitalized: the Mississippi River, the ARKANSAS GAZETTE, the United States . . . .

2. Then say, "Let us talk with each other without addressing anyone by name. We may have to point or use gestures to be understood." To introduce a topic you may say, "I am pleased with the reading you have been doing. What have you learned that you wish to share with us?"

   When the conversation begins to lag, help the students to note that they have been using personal pronouns because they have been talking to and about certain people.

3. Ask the students to suggest words that they would use if they want to talk about people and things in general. Write on the board this list of words: every-, some-, any-, no-, -one, -body, -thing. Ask the students to make compound words using combinations of words in the list. Then say, "These are indefinite pronouns."

4. Now flash on the screen again the sentences listed at the beginning of Lesson One. Ask the students to pick out the proper nouns, the personal pronouns, and the indefinite pronouns in the noun phrases.

   Say aloud the noun phrases in sentences 2, 3, 4, and 5. Ask, "What do you note about them?" (The noun is preceded by another word that helps us to get the sentence started.) The word preceding the noun is called a determiner. A noun phrase like this is written as NP $\rightarrow$ Det + N.

ASSIGNMENT

Ask the students to write ten sentences. Direct them to draw a vertical line after the noun phrase. Over the noun phrase, write what kind it is Remember a phrase may be one word or more.

Lesson Two: The Noun in Det + N

APPROACH

Write these sentences on the board:

1. The boys will run the machine for us.
2. Boys can run fast.
3. Some boys do not like girls.

Ask the students with your help to pick out the determiner in each sentence. <u>The</u> is a definite article. (You may want to stop here to define an article in this sense.) <u>Some</u> is a nondefinite article. Name others. Sentence two has no determiner, but the word <u>boys</u> belongs in the category Det + N. The word <u>boys</u> is a count noun.

The word null may be a new word for the students. It is simply a term used to indicate the absence of a word. Refer to sentence two. The sign for null is Ø.

PROCEDURE

Ask the students to substitute a or an for the articles in the above sentences. What happens to the word boys? It becomes boy. With your help ask the students to note that one characteristic of a noun in Det + N is that it can be counted. Can all nouns be counted? No. Name some. (furniture, blood, sugar . . .)

Now we can indicate that nouns in Det + N are of two kinds:

N ⟶ count + plural
noncount

Use as much oral drill as is necessary to be sure everyone understands Det + count + plural nouns or Det + noncount nouns.

ASSIGNMENT

Ask the students to bring to class useful objects, like tools, that they can write and talk about. Discuss carefully with them the following outline that will help you in evaluating the organization of their oral and written compositions. Give them one grade on organization and one on subject-verb agreement. Ask them (1) to define the object by telling what it is made of and describing its features and then (2) to explain the usefulness or practicality of the object.

See Writing: Unit-Lessons in Composition, pages 73-75, for examples of definitions. Parts A and B contain suggestions for helping the students to prepare their compositions.

FOLLOW-UP ASSIGNMENTS

1. Evaluate the oral composition by the number of questions unanswered by the student in his report to the class.

2. Check the errors in agreement of the subject and verb and ask the students to rewrite these sentences for you.

Lesson Three: The Determiner in Det + N

Explain the part of the vocabulary in the student exercises pertaining to determiners. In an oral exercise ask the students to make sentences using different determiners. Talk about the meaning of the demonstratives. Explain that careful use of determiners helps one to be understood.

KERNEL SENTENCES: THE VERB PHRASE

APPROACH

Recall the formula S ⟶ NP + VP. Choose from some of the student compositions sentences to represent the different verb patterns. Use the overhead projector to show the students the sentences. Help the students to separate the noun phrase and the verb phrase in each sentence. Because there has been a written and oral composition lesson since the study of the noun phrase, ask them to identify the noun phrases as proper nouns, personal pronouns, indefinite pronouns, and Det + N.

Lesson One: The Verb be

PROCEDURE

A. The verb we use so often is the verb be. There are different forms of the verb be. See how many you recognize in these sentences.

1. The book is on my desk.
2. I am hungry.
3. Our coach is a hard-working person.
4. The teacher will be here.
5. The girls were scared.
6. Christmas is vacation time.
7. The children are happy.
8. Jane was late this morning.
9. The waiter had been unhappy.
10. The boys have been in the shop.

Separate the sentences with the vertical line drawn between the subject and the predicate so that the entire verb phrase is noticeable. Ask what question is answered by the word or phrase after each be form in the predicate. (Sentences 1 and 4 answer where. Sentences 3 and 7 answer who or what. In the other sentences the verb be is followed by a word that describes.) We can now write a rule stating that the verb be needs a completer which may be an adverb of place, a noun (NP), or an adjective:

The verb be must be followed by a NP, an adjective, or an adverb of place.

B. Write these sentences on the board:

1. The man is looking for you.
2. They were here yesterday.
3. Joe had been waiting for us.

4. The teacher is kind.
5. The teacher is talking to her class.

Read each sentence aloud. Ask the students to decide which sentences contain the verb be. Then ask "How do you account for the be forms in sentences 1, 3, and 5?" Hopefully you will get an answer that the word is helping the predicate in the sentence. Write the word auxiliary on the board and tell the students that there is an auxiliary in every verb phrase. Explain the following formula:

VP → Aux + be + *NP, adjective, or adverb of place*

or

Aux + verbal

The auxiliary carries the tense signal which comes first in the verb phrase. Every verb phrase must have a tense signal. The two tenses are past and present.

THE VERB PHRASE: THE VERBALS

INTRODUCTION

Before we go deeply into the study of tense, we must discuss carefully the word verbal in the above formula.

Lesson One: Transitive Verbs

PROCEDURE

The word verbal refers to all finite verbs except the verb be. There are different types of verbals which we will present one at a time.

A. Write these sentences on the board:

1. Mother broke the vase.
2. She dropped her purse.
3. Some people are studying their lessons.
4. James will tell the story.

Ask these questions:

1. Who or what is the actor in each sentence?
2. What action is named in each sentence?
3. Who or what is the receiver of the action in each case?

B. Ask the students to make the receiver of the action the subject of the sentence and note how the sentence sounds:

1. The vase was broken by Mother.
2. Her purse was dropped by her.

3. Their lessons are being studied by some people.
4. The story will be told by James.

Following is a suggested way for helping the students understand the transitive verb:

NP		VP
actor	+ action	+ receiver of action
Mother	+ broke	+ the vase

NP		VP	
receiver of action	+ action	+ by	+ actor
The vase	+ was broken	+ by	+ Mother

When there is a receiver of the action in the sentence, the verbal is a transitive verb hereafter referred to as V_t.

Lesson Two: Intransitive Verbs

Write these sentences on the board. These sentences contain intransitive verbs. Do they seem to be used in the same manner in all the sentences?

1. Babies cry loudly.
2. Some girls become secretaries.
3. People gossip.
4. The children were playing in the street.
5. The corn grew tall.
6. The candy smells good.
7. The boys became tired on the hike.

(1) In which of the sentences can we recognize sentence sense by just saying the subject and the verb proper? (Sentences 1, 3, 4) For sentences like these, we say the $VP \longrightarrow Aux + V_i$.

(2) Look at sentences 2, 5, and 7. Each has a form of the verb <u>become</u>. In sentences 2 and 5 <u>become</u> is followed by an adjective. For sentences like these we say the $VP \longrightarrow V_b$ + *NP* or *adjective*. In sentence 5, the verb is grew which has a semblance of the meaning of become.

(3) Look at sentence 6. One of the verbs indicating sense (smell) is followed by an adjective. For a sentence like this we say the $VP \longrightarrow Aux + V_s$ + *adjective*.

Lesson Three: The Verb <u>have</u>

Explain the difference between these two sentences:

1. James has a car.
2. James has broken the rules.

Put the test for a transitive verb to sentence 2: actor + action + receiver and receiver + action + by + actor. Now do the same for sentence 1. Because there is no receiver of the action named in sentence 1, we cannot say that has is a V_t. For the verb have we say the $VP \longrightarrow Aux + V_{mid} + NP$.

The teacher may summarize by asking the students to refer to the vocabulary included in their exercises in Introduction to Language.

THE VERB PHRASE: THE AUXILIARY

APPROACH

Let's discuss the meaning of the word morpheme. The root morph simply means form. A morpheme is a form that indicates the smallest unit of meaning. A morpheme may be a word or a part of a word. Man is the smallest unit of meaning in the three-lettered word, m-a-n. In the word manly there are two morphemes: man + ly. In the word manliness there are three morphemes: man + ly + ness. (Note how the spelling changes.)

Morphemes are important in the verb phrase because we must change the forms of the verb be and the verbals as we attempt to communicate accurately.

For our purposes in studying the auxiliary in verb phrases, let's think of the morpheme as the smallest unit of meaning that can change the form of the word to indicate the meaning we are conveying to our reader.

Lesson One: Present and Past Tense of the Verb be

It would be impossible for us to write all the tense forms of all the verbs that we use in our writing so we use morphemes: present tense --- Pres; past tense --- Pas. The grammatical concept tense has to do with form, not with meaning. We have noted earlier in the discussion of the verb phrase that either past or present tense is always indicated. A writer or speaker must have some method of indicating the relationship of the time of action and the time of the speaking or writing about the action in a sentence.

We are going to attack the verb be and the two tenses first because the verb be has many forms. Following is a table that you will write in your notebooks to refer to often:

be + Pres ⟶ am when the subject is I
be + Pres ⟶ is when the subject is he, she, it, a proper noun, an indefinite pronoun or a Det + N when N is not plural
be + Pres ⟶ are in all other cases
be + Pas ⟶ was when the subject is I, he, she, it, a proper noun, an indefinite pronoun, or a Det + N when N is not plural
be + Pas ⟶ were in all other cases

The table above may be referred to when the teacher is discussing subject-verb agreement.

Use the practice sentences in the student exercises for drill. Be sure every student has a chance to participate.

Recall that the noun in Det + N may be either a count or a noncount noun. If the noun is one that can be counted, we simply mean that it has a plural form. The morpheme for plural is s: boy + s = boys; man + s = men; sheep + s = sheep.

Some of the sentences in the exercises will contain the morpheme s in addition to the morphemes Pres and Pas. The symbol # stands as the marker of the beginning or end of a word.

Lesson Two: Other Elements in the Auxiliary

We must stress that every verb phrase has tense. The tense will either be present tense or past tense. Tense is a morpheme that usually affects the form of the first word in the verb phrase. To illustrate this point look at these sentences with the students.

1. The boys are here.
2. Someone is coming.
3. Jane has been ill.
4. She will be a teacher

Separate the noun phrase and the verb phrase in each sentence. Now let's concentrate on the verb phrase.

Aux $\longrightarrow$ tense + (modal) + (have + part) + (be + ing). The morphemes are tense, part, and ing because they change the form of a word. Tense is required in all verb phrases. The other elements in parentheses may or may not be used. If any of them are used, they must follow the sequence listed above. The modals are can, will, shall, may, must. Present tense does not change the form of these modals. Must is always written must + Pres. The past tense changes the following modals:

can + Pas $\longrightarrow$ could
shall + Pas $\longrightarrow$ should
will + Pas $\longrightarrow$ would
may + Pas $\longrightarrow$ might

If we use the past participle form of a word, we indicate that there is a have in the sentence by using the morpheme part after have. Be + ing in the sentence indicates that an ing verb is in the sentence. Now for fun let's see what verb phrases we can form by using the formulas we have studied.

Every verb phrase begins with tense. Any other one or all the elements in the auxiliary may be used in sequence.

We will use he as the noun phrase.

1. He + Pres + be + ing + choose + a + new + hat.
   He # is # choosing # a # new # hat.

2. He + Pas + call + me.
   He # called # me.

3. He + Pres + will + be + ing + come + soon.
   He # will # be # coming # soon.

Now let the students look at their formulas for the verb phrase and make some sentences. Everyone should use the same noun phrase in his sentences. You work at the board saying aloud that we begin with tense. Choose either past or present. Then choose from the other elements of the auxiliary what pleases them. Then choose the verb be or a verbal. Help them to do this correctly. Go slowly at first. You may work two or three problems on the board with the students speaking out. Then have a quiet time, and let the students work on their own while you check their papers at their desks. Practice on exercises a short time each day until all the students can handle the verb phrase easily.

ASSIGNMENT

After you feel that the students can work on their own, ask them to write in their notebooks the sentences on their exercise sheet, using the example preceding the sentences.

OUTGROWING LESSONS

When you hear an ungrammatical sentence, write the sentence on the board and with the students' help try to write the NP and the VP of the sentence. Maybe this exercise will help the students to see that learning the VP will help them to write and speak effectively.

KERNEL SENTENCES: QUESTIONS

Lesson One: Yes/No Questions

APPROACH

I believe you are beginning to see that language patterns are natural. We seem to have a built-in knowledge of sentence sense. Let's use this built-in knowledge to describe how we ask questions that can be answered with either yes or no.

PROCEDURE

Write sentences for these strings:

1. Sue + Pres + be + ing + wait
   (Sue is waiting.)

2. A woman + Pres + have + part + be + here
   (A woman has been here.)

3. The boy + Pres + can + run + fast
   (The boy can run fast.)

Now write each of the sentences as a yes/no question.

1. Is Sue waiting?
2. Has a woman been here?
3. Can the boy run fast?

Now let us look again at the string for the first sentence:

Sue + Pres + be + ing + wait

Write the string for the question.

Pres + be + Sue + ing + wait

Describe what you have done. (You moved the first two items in the auxiliary to the front of the sentence: Pres + be.) Continue with the exercise, letting the students note that in writing simple yes/no questions we move the tense + be, or tense + modal, or tense + have to the position in front of the NP or subject.

Lesson Two: Using do in yes/no questions

Change these sentences into yes/no questions:

1. Jane walked to school.

2. The boy runs fast.
3. Joe works after school.
4. The shop teacher guided his students in their work.

The students will spontaneously respond by adding the correct form of do at the beginning of the sentence:

1. Did Jane walk to school?
2. Does the boy run fast?
3. Does Joe work after school?
4. Did the shop teacher guide his students in their work?

Now ask the students to describe the questions they have made by writing the string for the sentence.

1. Pas + do + Jane + walk + to school
2. Pres + do + boy + run + fast
3. Pres + do + Joe + work + after school
4. Pas + do + shop teacher + guide + his students + in their work

Lesson Three: Wh- Questions

Change these sentences into appropriate questions. Your questions will not be answered by simply a yes or a no:

1. Mary is in her room.
   (Where is Mary?)

2. My sister is coming here at noon.
   (When is your sister coming here?)

3. Jack read the directions carefully.
   (How did Jack read the directions?)

4. Sue broke her new watch.
   (What did Sue break?)

5. Bill can run very fast.
   (How fast can Bill run?)

6. Jim stayed at home because he was ill.
   (Why did Jim stay at home?)

There might be other questions suggested for sentences like the second one: Who is coming here at noon? Where is your sister coming at noon? Whose sister is coming here at noon? This would be an opportune time to discuss the necessity of being specific in asking questions to evoke the answer one is looking for.

USING TRANSFORMS TO WRITE EFFECTIVE SENTENCES

We also have a built-in knowledge about transforms. Transforms are kernel sentences that have been expanded by modification, subordination, and coordination. We use transforms to be specific in what we are saying--to answer the anticipated questions of our audience.

Let's choose a plural noun and verb to illustrate what we mean.

1. Babies cry.
   (Which babies cry?)
2. All babies cry.
   (What kind of babies?)
3. All spoiled babies cry.
   (How spoiled are they?)
4. All very spoiled babies cry.
   (How do they cry?)
5. All very spoiled babies cry loudly.
   (When do they cry?)
6. All very spoiled babies cry loudly when their mothers are busy.

Let the students choose noun phrases and verb phrases and then ask questions to add to the sentences.

Choose sentences at random from the students' writing. Use the overhead projector to show the students the sentences. Discuss the sentences before asking for suggestions for rewriting the sentences.

Choose paragraphs that the students have written and present them with the overhead projector. Let the students combine some of the sentences by using coordination and subordination. You should receive a variety of suggestions for combining sentences. Probably all the suggestions will be grammatically correct, but some combinations will sound better than others. Let the students recognize the effective sentences without your prodding them.

NOTE: If you do not have appropriate examples from your students' writing, you may use sentences from their reading materials for the exercises. Be sure the sentences and paragraphs are studied orally. A student benefits more from hearing the language than from merely writing it for a grade. If he is trained to listen for good sentences, he may be helped to "hear" the sentences he himself writes.

See Writing: Unit Lessons in Composition pages 31 to 39 for practice exercises in writing effective sentences.

STEINBECK'S *THE PEARL*: A STUDY OF AN AUTHOR'S USE OF LANGUAGE

INTRODUCTION

The text used for this unit is a Bantam Pathfinder Edition (ED78) of The Pearl by John Steinbeck.

In The Sea of Cortez, Steinbeck has recorded the myth of a La Paz Indian boy who found the pearl. The teacher may or may not present this story before studying the novel. The English Journal, October 1963, contains a discussion of the relation of the myth to Steinbeck's story, The Pearl.

APPROACH

Steinbeck's stories are unforgettable because of the language and style he uses to weave a worthwhile story. The Pearl may be used as a study of the human characteristics of all of us regardless of where we live or who we are. We all have the same needs--food, shelter, clothing--and we are guided by traditional teachings. We experience the same feelings--jealousy, hate, anger, love, hopelessness--to which we respond in various ways. Steinbeck uses different songs in his story to indicate the fortunes and misfortunes of Kino and Juana and their fellow villagers in La Paz. The description of a song helps the reader to project himself into the story because he is made aware of the tone of the story.

PROCEDURE

Because the purpose of this unit is to study the uses of language, the teacher should read the story aloud so that the students hear the language.

Lesson One: Chapter One of The Pearl

Read chapter one without pausing. Then by calling attention to sentences and paragraphs, point out how the students may enjoy the story more if they read between the lines. Go slowly in your interpretations so as not to overwhelm students for whom the close reading of a story is new.

The first paragraph of any story is important and usually helps the reader to orient himself to the action, the setting, and possibly to the characterization in a story. The first paragraph of The Pearl is puzzling and will have no meaning until the student understands the whole story. In his introduction Steinbeck says, "And, as with all retold tales that are in people's hearts, there are only good and bad things and black and white things and good and evil things and no in-between anywhere." The first sentence in the story, "Kino awakened in the near dark," contains one of the contrasting ideas--darkness. Also there is in the first paragraph

a description of animals. Man is animal. How does man work to satisfy his needs? What do animals do for their needs?

On page 2 we have the first mention of the songs with the explanation that everything the people saw or thought or did or heard became a song. There are personal songs. Kino's first song is the Song of the Family. What are the sounds, sights, and actions that make up Kino's Song of the Family? On page 6 the Song of the Family becomes the Song of Evil. Why?

The story opens with the dawning of a day and the description of the full dawn continues.

-- "The stars still shone and the day had drawn only a pale wash of light in the lower sky to the east." (page 1)
-- Kino went outside to watch the dawn. "The dawn came quickly now, a wash, a glow, a lightness, and then an explosion of fire as the sun rose out of the Gulf." (page 2)
-- "The world was awake now . . . ." (page 5)

Folk beliefs and folkways are woven into most stories, and <u>The Pearl</u> is no exception.

-- "When Kino had finished, Juana came back to the fire and ate her breakfast." (page 5)
-- "He lowered his blanket from his nose, now, for the dark poisonous air was gone and the yellow sunlight fell on the house." (page 5)
-- "The thing had become a neighborhood affair." (page 10)
-- " . . . Juana repeated an ancient magic . . ." (page 6)

Sensory descriptions are used to stir the senses of the readers, to draw them into the story.

-- " . . . the sound of breakfast . . ." (page 4)
-- "They could hear the splashing water." (page 12)
-- "And they could smell the frying of good bacon." (page 12)
-- "Kino could see the green coolness . . . ." (page 13)

Other descriptive passages are noted:

-- A description of the doctor (pages 13 & 14)
-- A description of the procession (page 10)
-- Descriptions of the animals (page 5)
-- A description of the animals (page 3)
-- Description of the animals (page 1)

A good author will quite often describe an incident that causes the reader to recognize certain emotions. Sometimes the writer states the emotion to explain certain actions:

-- "Kino felt weak and afraid and angry at the same time. Rage and terror went together." (page 12)
-- "The doctor put his cup down gently before he let his anger rise." (p. 14)
-- "And now a wave of shame went over the whole procession." (page 15)

On page 16 there is an example of a bared emotion shown through the actions of Kino. Why does Kino strike the gate?

Steinbeck is a good story-teller. Let's note first a sentence on pages 2 and 3 that indicate simple movements (actions) without any embellishing: "Juana went to the fire pit and uncovered a coal and fanned it alive while she broke little pieces of brush over it." There are many sentences like this in the story. We call this moving the story by narration. On pages 6-8 we have a narration of an incident that brings tenseness to the story. The visit to the doctor in town, pages 13-15, is another incident that adds to the suspense of the story. How does the author in his use of language bring about a feeling of tenseness in the reader?

Inanimate objects are important in stories. The author quite often introduces an object early in the story and then refers to the object from time to time so that the role the object plays becomes a thread of the plot.

The inanimate object in the first chapter is Juana's shawl. On page 4 we are told how Juana "hammocked her child in her shawl." The shawl is mentioned again on page 10 when the family is preparing for the visit to the doctor.

Lesson Two: Preparing for Group Discussions

The students will probably be able to continue the analyzing begun with the study of the first chapter. They may want to work in groups so that each student does not have to concentrate on all the ideas. Then in the group discussions from time to time the students who have worked on a particular idea can contribute to the discussion. Probably the students will realize from their discussions how an author weaves a story by using the language purposefully. Following are some ideas that may serve as topics:

1. Bared emotions shown through the actions of characters
2. Folk beliefs and folkways
3. The different dawnings of new days
4. Songs and music
5. Sensory descriptions
6. Narrated incidents

Following is a list of references for each topic. The teacher and the students will find other references during their study:

1. Bared emotions

-- Juana dares to try to throw the pearl into the gulf. Kino is brutal. Why? He loves Juana. (page 76)
-- They must save themselves. (page 79)
-- Kino is not an evil man. (page 80)
-- He feels a surge of exhilaration. (page 81)
-- Kino is a killer. (page 113)
-- Triumph (page 26)
-- What brought on the emotions, fear and rage? (pages 47-48)

-- tension (page 50)
-- emotions bared by the man with a coin in his fingers (pages 62, 65)
-- afraid of the unknown (page 69)
-- Juan Tomas is afraid for Kino (page 70)

2. Folk beliefs and folkways

-- "It is not good to want a thing too much. It sometimes drives the luck away." (page 24)
-- "The Father is coming." (page 35)
-- "Gods do not love men's plans, and the gods do not love success" (page 38)
-- covered noses (page 44)
-- the way he wore his hat (page 57)
-- old ways of great-great grandfather (page 60)
-- idea of a canoe (page 80)
-- mourning (page 83)
-- evil night air (page 87)

3. The different dawnings of new days

-- after a murder (page 81)
-- the day the pearl is to be sold (pages 51 and 55)
-- The late moon arose before the first rooster crowed. (page 75)
-- "All night they walked, and the first dawn Kino searched the roadside for a covert to lie in during the day . . . . And then, in the first light he heard the creak of a wagon." (pages 91 and 92)

4. Songs and music

-- Song of the Pearl that might be (page 22)
-- secret melody of the maybe pearl (page 26)
-- music of the pearl merged with the music of the family (page 30)
-- music of the pearl: truimph (page 33)
-- the song changes. Why? (page 35)
-- Song of the Family (page 37)
-- Song of the Family (page 43)
-- Song of Evil (page 47)
-- Evil (page 66)
-- Song of the Family (page 72)
-- evil music (page 80)

5. Sensory descriptions

-- imagery (pages 46, 47)
-- news of the pearl (page 30)
-- the dark and the light (page 82)
-- metaphor (page 27)

Lesson Three: Ideas for Composition Following the Study of The Pearl

A. Some of the comparisons in the story may be studied. The techniques for writing comparison-contrast paragraphs should be discussed before the students are asked to write. For examples of writing comparison paragraphs see the two paragraphs on Imaginings on page 34 and the paragraph on page 30, beginning with "But Kino and Juana did not know these things." See also "Develop meaning through comparison," pages 86-90, in Writing: Unit-Lessons in Composition.

These are topics based on The Pearl that may be studied or outlined:

1. The doctor (pp. 11 and 14) and Kino (p. 4)
2. The village (p. 10) and the town (pp. 17 and 27)
3. People with things to sell and people with favors to ask (p. 29)
4. The incandescence of the pearl (pp. 31 and 51) and the darkness of the pearl (pp. 93, 94, and 117)
5. A family leaving (p. 89) and a family returning (p. 114)
6. Kino's visit to the doctor (pp. 13-15) and the doctor's visit to the village (p. 38)

B. Some of the students may want to choose an inanimate object in the story and explain how the author purposefully uses the object. Of course, the pearl is the most important inanimate object and a discussion of it could be divided into different phases. Other objects include: Juana's shawl (pp. 10, 11, 19, 20, 31, 34, 47, 57, 115)
Kino's canoe (pp. 19, 80)
a rifle (pp. 32, 93, 109, 113, 114, 115, 117)

Lesson Four: Review Questions

Following is a list of questions that the teacher may use as the book is being read to see if the students are understanding the story. Or the questions may be used for review and discussion at the end of the study.

Chapter One

1. What does a pearl commonly represent? What does it represent at the beginning of this novel?

2. What evidence is there in chapter one that Kino and Juana were poor? What evidence is there that they were superstitious?

Chapter Two

1. Why was Kino's boat extremely important to his way of life?

2. Describe in detail Kino's discovery of the pearl from the time he first saw the oyster until the time when he removed the pearl from the oyster.

Chapter Three

1. As news spread through the town about Kino's discovery, various people reacted differently. Explain how the priest, the shopkeepers, the doctor and the pearl buyers reacted when they heard the news. What do you think of their reactions?

2. Explain the meaning of the following two sentences:
"The essence of pearl mixed with essence of men and a curious dark residue was precipitated." (pages 29, 30)
"The news of the pearl stirred up something infinitely black and evil in the town . . . ." (page 30)

3. Why, after he discovered the pearl, did Kino become "every man's enemy"?

4. What were Kino's plans for his family now that he had discovered the pearl?

5. Why do you think the song of evil came into Kino's mind when the priest appeared?

6. Why does Kino begin to feel "alone and unprotected"? (page 37)

7. What was the doctor's real purpose in going to see about Kino's baby? How did he discover where Kino had hidden the pearl?

8. After Kino had attacked the intruder who tried to find the pearl, what did Juana want to do with it?

Chapter Four

1. Why did all the neighbors go with Kino and Juana to the pearl buyers?

2. What did the first buyer say about Kino's pearl? How much did he offer Kino for it? Why did Kino not accept the offer?

3. What were the two opinions among Kino's neighbors concerning his refusal to sell his pearl? Do you think he should have sold it? Why?

4. What did Juan Tomas mean when he said, "You have defied not the pearl buyers, but the whole structure, the whole way of life, and I am afraid for you"?

5. What did Kino decide tc do after he refused to sell his pearl?

6. Why does the author never reveal the identity of the persons who attacked Kino and tried to steal his pearl?

Chapter Five

1. What did Kino do to Juana when she tried to destroy the pearl? Why do you think he reacted in this way?

2. What made Juana realize that the old life was gone forever, and that the only thing they could do now was save themselves?

3. Why was the destruction of Kino's boat worse than killing a man? Why didn't Kino consider the possibility of stealing one of his neighbor's boats?

4. What happened to Kino's house?

5. How did Juan Tomas help Kino and his family escape?

6. Kino referred to the pearl as his misfortune, his life, and his soul. What do you think he meant?

Chapter Six

1. How did Kino reply to Juana's remark that perhaps the dealers were right and the pearl was valueless?

2. What did Kino want Juana and Coyotito to do after he discovered they were being trailed? Why do you think Juana refused?

3. What were some of the ways Kino attempted to make the trackers lose their path?

4. How did Kino Plan to attack the trackers? What were Juana and Coyotito supposed to do? What happened to Coyotito during the fight?

5. Why did Kino and Juana return to La Paz? Why do you think they walked side by side?

6. Why did Kino throw away the pearl? Why did Juana, at this point, refuse to do it? Why do you suppose Kino threw the pearl into the sea? Could he not have thrown it away in the mountains? Explain.

SHAKESPEARE'S USE OF LANGUAGE: JULIUS CAESAR

Lesson One: Improvisations

INTRODUCTION

Because Shakespeare is the best portrayer of human nature, everyone should have an opportunity to become acquainted with the language that Shakespeare uses to reveal a story through the human traits of his characters.

Through improvisations the students can recognize the feelings and actions of people caught in situations similar to those in Julius Caesar. Improvisations are natural for students when they become involved in trying to explain even a simple incident. Talk, gesture, and movement work together. The teacher, when she knows her class, can decide whether she wants to begin discussion with the entire class or whether she wants the students to work in groups, with each group pursuing a different idea.

We are including in this lesson some suggestions for improvisations that the students can relate to and then relate to their study of Julius Caesar. The copy of Julius Caesar that we refer to is Julius Caesar by William Shakespeare, adapted by Jack A. Wapen and Leroy S. Layton, Globe Book Company, 1952.

The students' reactions and feelings in these situations may not be the same as those described in the dialogue in Julius Caesar. The students will recognize the situations when Julius Caesar is read and the play becomes relevant to them. James Moffett writing in Drama: What is Happening? says that if a play works, communicates, it is because the same social forces that have installed voices in the author have also installed them in the spectator. Dr. Moffett is talking about the experience of seeing a play. Reading a play will not be as effective unless the listener and reader can identify with the characters. Improvisation is one method that helps the readers because they become involved in situations similar to those in Julius Caesar.

SUGGESTED SITUATIONS

1. A man is warned that he will have bad luck or even may be killed if he leaves his house. Someone, maybe his girl friend or wife, tries to persuade him to stay at home. Act I, ii, 22; Act II, ii, 8-10

2. Two friends meet. One acts a bit cool toward the other. Act I, ii, 30-75

3. A new hero appears on the scene, replacing one who has been quite popular. How would the crowd react? How would friends of the former hero react? How might a jealous "friend" react? Act I, i; ii, 89-129.

4. Make detailed plans of a plot to get even with somebody. Can you trust all the plotters? The plotters may have a disagreement. The leader will use persuasive tactics to convince others to follow the plan. Act I, iii, 120-160; Act IV, ii, 15-45

5. Suppose you do something that you shouldn't have. Someone questions you. How do you cover up your actions? Act II, i, 231-255

6. Discuss how you would react to being betrayed by your dearest friend. Through dialogue and pantomime construct scenes to portray your ideas. Act III, i, 79

7. A friend of a murdered man attempts to find the truth about the murder. How would he approach the murderers? What excuses would the murderers give for the killing? How do the murderers convince a mob of the reasons for killing? Act III, i, 130-150; Act III, ii, 14-60

8. A friend or friends of a murdered hero stirs the people to rioting. What kinds of speeches will be used? How will the crowd react? Act III, ii, 73-265

9. An innocent man is killed. Why? Act III, iii, 5-35

10. One is a boaster. How will his associates react? Will they try to show him up by giving him a dare? Act IV, ii, 75-96

Lesson Two: Reading the Play

The teacher may begin by reading the play aloud to the students until they are in tune with Shakespeare's language. Stop frequently to interpret so that the play has meaning for the students. Play a recording to let students hear the language. Filmstrips will also help to picture the various scenes in the story.

Lesson Three: Thinking About the Play

1. How do some people gain power?

2. What is a rabble-rouser? Is Brutus one?

3. Why is it that those who receive greatness and honor are often envied by others, sometimes their closest friends?

4. How does Antony use facts and opinions in Act II to influence the people? List the known facts. Which is more effective for his purpose, fact or opinion? See Writing: Unit Lessons in Composition, Unit 22.

5. Brutus' errors in judgment led to the failure of the conspirators' plan to overcome Caesar and his influence in Rome. What errors did he make?

NOTE:- There are good study questions in the student's textbook that may be used for discussion and writing.

WRITING AN AUTOBIOGRAPHY

Tenth grade students should write an autobiography that can be filed in their individual folders for reference later. Many of the students will have a misconception of what an autobiography is because they are familiar with biographies that are records of the lives of people. Tell them that you do not want a theme that sketches their lives from the day they were born to the present. Rather you would like to know about moments in their lives that have had an impact on some of their decisions or has helped them to develop a personality. Reading books from the Impact Series (Holt, Winston) will be a starting point for discussion. You may help the students recall that they have written some about themselves as they identified their personalities when they were discussing attitudes and careers. Then you may say, "I do not want you to try to tell the whole story of your life; I do want to know you better, and you are the only one who can tell me about yourself. A very wise man once said, 'I am a part of all that I have met.' To me this means that I am what I am because of the experiences I have had, the people I live with, the people I have met, the books I have read. Of course, I am also what I am naturally. My personality reflects my likes and dislikes, my disappointments and satisfactions, my joys and sorrows."

Tell the students that they should write about the things about themselves that are important to them. They should tell in detail those experiences which keep coming to mind as they think about themselves. They may like to forget some experiences, but these may be important to their autobiographies. They may tell about unusual hobbies or ideas, persons that have greatly influenced them (rightly or wrongly), recognitions they have had, or problems they have faced or are facing. The autobiographies should reveal the students' thinking about such things as schools, jobs, religion, politics, etc.

The teacher will need to help the students to limit their topics to a central idea. The paragraphs in the body of the theme will contain incidents or illustrations or examples that will each emphasize the central idea or add more information about the central idea.

AUDIO - VISUAL AIDS

I. Films (The numbers refer to the film library of the Little Rock Public Schools.)

A. Guidance and Personal Development

322 - "Belonging to the Group"	16 minutes	
251 - "Developing Self-Reliance" (Analyzes the steps in developing self-reliance)	11 minutes	
601 - "Improve Your Study Habits"	11 minutes	
311 - "Learning to Study" (Study in conscious learning)	14 minutes	Color
278 - "Let's Pronounce Well" (Listeners apply what they learn)	11 minutes	
323 - "How to Think"	13 minutes	
909 - "How to Read a Book" (Shows how to select a book for a particular purpose and how to use a book's reading aids)	11 minutes	Color
400 - "How to Succeed in School" (A discussion of attitudes)	11 minutes	

B. Library Tools

727 - "Magic Book" (Taking care of books)	10 minutes	Color
221 - "Making Books" (From author's manuscript to completed book)	11 minutes	
846 - "You'll Find It in the Library"	13 minutes	Color
468 - "Dictionary, Using the: Look It Up" (Designed to motivate the dictionary habit)	11 minutes	
154 - "It's Fun to Read Books"	10 minutes	
849 - "Libraries Are for Sharing" (Using the card catalog)	11 minutes	Color
134 - "Printing Through the Ages"	13 minutes	

C. Speaking and Listening

502 - "Effective Listening"	15 minutes	
278 - "Let's Pronounce Well"	15 minutes	
284 - "Fundamentals of Public Speaking" (The importance of public speaking in everyday life is presented in a typical school situation)	11 minutes	
180 - "Parliamentary Procedure" (Special emphasis on motions and amendments to motions)	11 minutes	
219 - "How to Conduct a Discussion" (Explains some of the basic principles of discussion methods)	17 minutes	
"Listening Skills: An Introduction"		Color
"Improve Your Oral Reports"		

II. Filmstrips

These may be ordered from: Society for Visual Education, Inc.
1345 Diversey Parkway
Chicago, Illinois 60614

Order No.		
125-S	"Your Dictionary and How to Use It" 6 color filmstrips	$27.00
123-S	"Words: Their Origin, Use, and Spelling" 6 color filmstrips	$27.00
V151-2	"Use Your Library for Better Grades and Fun,Too" Black & White	$ 6.00
C788-SR	"Vocational Decisions" 3 color filmstrips, 1 record	$24.75
778-SA	"Foundations for Occupational Planning" 5 color filmstrips	$22.50

III. Posters and Transparencies

These may be ordered from: Gene Swepston Company
2324 Durwood Road
Little Rock, Arkansas 72207

Order No.		
FA0150	"Using Your Library" 32 posters in color	$ 5.50
253-875	"How to Use a Library" 41 overhead transparencies	$175.00

IV. Free Booklets for Class Use

"SPACEWAYS"

A Student-Planned Unit

Toward the end of the second quarter, the teacher may wish to determine the degree to which students are able to make use of the communicative skills taught in the earlier modules. One method for evaluating their ability to use these skills is to design a unit in such a way that the students themselves can have a major part in planning and carrying out its activities.

The unit entitled "Spaceways" in the reading anthology Perspectives (Scott, Foresman, 1963) provides good source material for planning a unit such as the one described above. Students find the subject of space intriguing, and they will be particularly interested in reading the stories and articles contained in this section.

OBJECTIVES

Objectives can be outlined by the teacher at the beginning of the unit, or they can be established through mutual planning and discussion by both teacher and students. How the objectives are established must depend largely on the judgment of the teacher as to the ability of her students to participate in this phase of the planning. The objectives listed below set forth suggested goals a teacher might hope to accomplish through teaching the unit:

1. To provide practice in developing techniques for finding the central idea in reading

2. To provide opportunities for using the Readers' Guide, reference materials, and the card catalog to find library information on an assigned topic

3. To provide opportunities for students to use the written and oral language to express themselves knowledgeably on a topic or project of their choosing

4. To help students plan and produce a program for other students and teachers based on what they have learned about space.

ACTIVITIES AND PROJECTS

After the unit objectives are established, a suggested list of projects and activities should be given to the students. The teacher should discuss these with the students, allowing them to make additional suggestions. So far as possible both teacher and students should then decide upon the content, the sequence, and the activities of the unit. Again, the degree to which students can do this type of planning successfully will depend largely on their ability to make mature choices as well as their confidence in expressing their ideas. If the classroom atmosphere is not conducive to freedom of expression, the

teacher can expect very little participation from the students. If they do participate, however, the teacher is provided an excellent opportunity to see how well the students can put into use the speaking, reading, listening, writing, thinking and social skills taught in the earlier modules.

Given below are lists of activities and projects which might prove helpful in planning the content of the unit.

A. Textbook Activities

1. Read pictorial survey of space exploration in the textbook, pages 204-208.

2. Read and discuss "Astronaut Aweigh," pages 209-222. Complete related vocabulary and writing assignments, page 222.

3. Complete Exercises I-II, "The Central Idea," pages 550-559.

4. Read and discuss "Suited for Space," pages 228-233.

5. Read for enjoyment "The Prisoner," pages 234-244.

6. Complete Exercise III, "The Central Idea," pages 559-561.

7. Read "Before the Astronauts," page 246.

8. Complete cards 29-33 in Tactics II.

B. Library and Class Activities

1. Spend class periods in the library gathering information on projects and reports.

2. Confer with students individually to decide how to disseminate the information they have learned from their project.

3. Prepare bulletin boards, containing displays and information relating to space.

4. Prepare "comment cards" on science fiction stories to share with other students.

5. Locate central ideas from recent magazine articles relating to space.

6. A culminating activity might well be the development of a program or panel by the students to share some of the information they have learned with other students and invited guests. Committees can be formed to make selections concerning the participants and the content of the program. Again, this is a good way for students to participate actively in planning the unit work. In addition, the teacher can determine how well the students are assimilating the skills being taught. The following are two sample programs, both worked out by students from two different classes:

"The Last Frontier"	"A Decade of Space Exploration"
presented by	presented by
The Young Communicators	The Junior Parliament
Master of Ceremonies:	Master of Ceremonies:
EARLY SPACE PIONEERS Wan Hu Leonardo da Vinci Robert Goddard	EARLY SPACE DEVELOPMENTS Wan Hu, Leonardo da Vinci, Robert Goddard Development of the V-2 Rocket
MODERN ACHIEVEMENTS IN SPACE 1958-1964 1965-1967 1968-1969	SATELLITES Tiros - the weather satellite Explorer - the research satellite Telstar - the communications satellite
THE MOON - A MYSTERY UNCOVERED	MANNED SPACE PROGRAMS Mercury Gemini Apollo

C. Projects

The information below is printed as it was given to students who participated in planning a unit in "Spaceways". It can be adapted to fit various class needs and differences.

1. POSTERS, CHARTS, DIAGRAMS

a. Space Vocabulary: Prepare a list of words showing how they are used in space. Examples: NASA, LEM, chaff, chicken switch, capsule, etc. You would need to read a number of articles and books to locate interesting examples of words.

b. Diagrams of Rockets, Space Capsules, Firing Techniques, etc.: Several excellent diagrams are available in encyclopedias. See the Students Encyclopedia, Vol. 17 for a good example. You would need to prepare brief explanations of each part of the rockets or techniques you included. These explanations can be oral or written.

c. Milestones in Space Exploration: Show some of the outstanding developments in space exploration. Give the year, and then write a brief account of the event. Use pictures when possible.

d. A Decade of Space Exploration, 1960-1969: During this brief

period we have moved from the launching of unmanned spacecraft to a manned flight around the moon. Brief illustrations of some of the key events during this decade would be very interesting. Your purpose would be to show the tremendous strides which have been made in space exploration.

e. The Astronauts: Pictures, newspaper articles, illustrations, etc., of the astronauts would provide some very interesting poster displays. You can choose one astronaut if you wish and find out all you can about his background, his selection as an astronaut, his qualifications, etc.

f. The Balloon Flights: Include illustrations and drawings showing the first balloon flights. You can find much material on this subject in your textbook.

g. Flight Experiments of Leonardo da Vinci: Many of his sketches are available in encyclopedias. You will find that he invented many of the ideas we use today.

h. Cape Kennedy: You can obtain some material on this subject by writing to tourist centers in Florida. Try to find out exactly what goes on at the Cape.

i. N.A.S.A.: Try to determine the purpose and function of this group. What was its origin? What are its future plans?

j. Apollo Space Flights: Trace the plans and development of the Apollo program. Include a diagram of the flight plan of Apollo 8.

k. Telstar-Comsat: See what you can learn about the development of communications satellites and the impact they have had on world communications.

2. SCALE MODELS

Several hobby shops and ten-cent stores have scale models of rockets, space ships, early airplanes, fighter planes, etc. You can assemble one or more of these and prepare a brief oral or written report to accompany your model. You may wish to assemble several models and show the great progress made in air travel.

3. WRITTEN OR ORAL REPORTS

a. Growth of Commercial Air Travel

b. Development of Rockets in Russia

c. Robert Goddard

d. Jules Verne

e. Aerospace medicine

f. Wernher von Braun

g. UFO's

h. Explorations of Mars

i. Any of the current satellite systems (Tiros, Explorer, Echo, etc.)

4. CREATIVE WRITING

a. Short story or play based on information gained about space. This would be a "science fiction" story such as "Astronaut Aweigh" or "The Prisoner" in your text. Please note that such a story, though science fiction, would need much careful research and thinking to make the situation believable.

b. News articles about an imaginary landing on Mars. Include headlines, photographs, feature stories, etc.

5. UNIT PLAN

A unit plan such as the one outlined below can be worked out by students and teacher and placed on a master log sheet or on the blackboard. This will enable everyone to know what is happening on specific days within the time scheduled for the unit.

1	2	3	4	5

SUGGESTIONS FOR TEACHING JULIUS CAESAR

CLASSROOM ACTIVITIES

In order to vary the classroom approach to the reading of Julius Caesar, several methods can and should be used. Various suggestions and comments are listed below:

Student reading: Students can read the play aloud, taking turns. When questions arise it is easy to stop and discuss various points which are important to the students' understanding or the ideas which you think should be stressed.

Professional recordings: For preciseness in diction and expression, various professional recordings are excellent. We recommend them especially for sound effects and for accurate interpretation of important scenes.

Filmstrips and accompanying records: While these do not record the play in its entirety they do provide the "story" as well as an analysis of the play's structure and some insight into its meaning. The series entitled Selected Shakespearean Tragedies (A147-2SR) produced by the Society for Visual Education is helpful.

Student recordings: If time permits, students can record all or parts of the play on tape. These recordings can be used not only to "tell the story," but also as a point of departure for instruction concerning diction and expression. In addition, when students hear other students on tape, they can sometimes be motivated to make their own recordings of various scenes. By careful editing over the years you can build a collection of good student recordings.

Student acting: Students usually enjoy acting out parts of the play. If a movie camera is available, the acting can be filmed. This technique is quite good for motivational purposes.

Insofar as it is practical, the students should be allowed to participate in the decision making with regard to the type of oral reading that is done. They should also be reminded to look for situations in the play similar to their improvisations.

THINKING ABOUT THE PLAY

The study questions in the student packet may serve as the basis for class discussions or writing assignments. Their usefulness will depend upon the perception and insight of your students as well as your methods of teaching the play. You may want to use all the questions or some of them. You may decide to add questions of your own. These are included to guide the students' thinking. You should use only those which you think will contribute to their understanding.

Additional theme and project suggestions for individual and group work are listed below:

Analysis of Shakespeare's Language: Since an abridged, "modernized" version of the play is being used, you may wish to have students compare the modern rendering of various lines with the original. This would enable them to see how language has changed since Shakespeare's day and should provide interesting work in word origins and contrasts between twentieth century usage and the usage of the Elizabethan Age.

Julius Caesar and the Mass Media: Students can plan television and newspaper coverage of the assassination of Caesar. In groups and as individuals they can plan the content and format of various television programs and news articles relating to the assassination. Students can select various television news programs to use as patterns. They can also practice writing news articles, feature articles, etc. A project such as this could be expanded or shortened to correspond to the ability and interest of your class. The following topics could be adapted for use in planning programs and news articles:

1. News coverage of the assassination

2. Biographical details of the conspirators with news commentators' opinions concerning why they participated in the assassination

3. Television coverage of Antony's speech in the Forum

4. Television coverage of Caesar's funeral (This would require library research into Roman burial customs.)

5. Biographical programs concerning Mark Antony, Calpurnia, and Octavius Caesar

6. Program depicting the political rise of Caesar

7. Program entitled "The Future of the Roman Republic." Such a program would contain a panel of distinguished news commentators and would predict the future of the Roman republic

8. Interviews with outstanding Roman citizens, including Cicero and Publius

9. Interviews with "the man in the street" - the Roman citizen - and his reactions to Caesar's death and Antony's speech.

10. Interviews with Flavius and Marullus, the two banished tribunes

11. Special editions of the Roman Times, dated February 15, 44 B.C., and March 15, 44 B.C. Some interesting contrasts could be made in this project.

Architectural Development of the Elizabethan Theater: Students interested in architectural design may want to trace the changes in the style of the Elizabethan theaters. They may wish to draw floor plans and sketches of the exterior. To carry the project further, students may wish to contrast the theaters of Shakespeare's day with those of today to see how people's ideas of beauty and practicality have changed.

BIBLIOGRAPHY

The following books and articles offer helpful ideas concerning interpretation and teaching techniques:

BOOKS

Craig, Hardin. Shakespeare: A Historical and Critical Study with Annotated Texts of Twenty-One Plays. Scott, Foresman, 1958. ("A Tragedy of the Second Period" pages 322-323 concerns Julius Caesar)

SUPPLEMENT

A Suggested Reading List

INTRODUCTION

You have received a packet of materials that have been devised with you in mind. This is your first year in a senior high school. You have chosen to attend Metropolitan High School and you will want to become a participating member of the student body. To help you to make a smooth transition from junior high school you have been given this packet of materials on orientation. The process of orientation is a study of adjusting to a new environment or to a similar environment where there are some new ideas and/or situations. The varied exercises are suggestions to help you to understand yourself as a student and your responsibilities as a student.

A pre-test is placed at the beginning of the series of lessons to orient and to stimulate your thinking.

You are in your English classroom with other students in English 10 and your teacher. The first topic we will discuss may be referred to as housekeeping chores. Wherever there are people working together there are housekeeping chores that we must all perform if we are to have uncluttered surroundings so that we can do orderly thinking. Everyone seems to feel safe and at ease when he knows exactly where he is heading and when he understands how he is to reach a destination. In other words he knows what is expected of him. Your teacher will explain to you the ideas that we will follow for the semester. She will also list the tools you will need in your activities. Keep the lists she gives you and refer to them from time to time.

Keeping a Log

We need to check on ourselves daily to see how we are progressing. This is a student-teacher project. We will all keep a "log." Are you familiar with this word in any way? Discuss your ideas with your classmates and with your teacher. Write your choice of a definition in a sentence beginning "A log is (noun) + (modifier)." Keeping a log will be an orderly way for each one of you to keep a record of his progress. As a student you are working to improve your skills. You are competing only with yourself.

In this packet there are three pages that make up your log for the first nine weeks of school. On a bulletin board your teacher has placed a copy of her log listing planned activities. Note briefly exactly what you did during the period. Ask yourself: What did I achieve? Could I have done better? Did I do a satisfactory job? Be frank in your day by day comments on what you feel you have accomplished and what you feel your shortcomings are. Listen carefully to the more specific directions that your teacher will give.

PRE-TEST

The teacher may ask you to write about some of the following questions. Even though the word test is used in the title, this is really an inventory. Note carefully the idea of keeping a notebook. Determine now to keep a neat, orderly record. Careful directions will be given from time to time about keeping a notebook. You should feel free to add materials that you are interested in. These are the questions for you to think about.

1. What are credits?

2. How many units are needed for graduation from Metropolitan High School?

3. What occupation would you like to pursue?

4. What courses will aid you in understanding the work world involved in this occupation?

5. What are "elective courses"? Of what value are they?

6. What are communication skills?

7. Are communication skills learned only in an English classroom? Explain your yes/no answer.

8. What speaking skills will you need after you graduate from high school?

9. What are your strong points as a student?

10. What do you consider your weaknesses to be?

11. Tell how attitudes are important for you as a student.

12. We are agreed that it is important that we get along with others. When will you be tested on how well you get along with others in school and out of school? Be specific in your answers.

NOTEBOOK ASSIGNMENT:

From time to time list in your notebook any ideas you may have about other things you will need to know before you can become a good high school student. Title this page of your notebook "Becoming a Good Student."

Be sure you understand the meaning of the underlined words:

1. We need to develop positive attitudes towards life.

2. Sometimes communication is lost because one is a poor listener.

3. A student should take an inventory of his work skills.

2. A time for unhurried meals

3. A time for recreation

4. A quiet time (at least 10 minutes per day)

5. A time for outside work or for chores at home

Hand in the finished schedule written as neatly and orderly as you can write.

Lesson Three

READING ASSIGNMENT: Pages 27-33

This is a silent reading assignment. Read as the teacher directs you and answer the thought questions she will give you. As you read, jot down questions you may want to ask or ideas you would like to have discussed in class.

This part of the handbook called "Rules and Regulations" has been devised to help each of you to fit into a school pattern. Wherever there are many people there is a need to identify the rules that help in carrying out daily activities. Some educators may call this a plan for discipline. Look up the word discipline to find its various meanings. What do you think would be the meaning of self-discipline? Why is self-discipline important?

Lesson Four

READING ASSIGNMENT: Pages 36-40

As a member of the student body, you have a voice in the Student Council. How? Discuss the Student Council with the teacher and your classmates until you thoroughly understand how the council works and what your responsibilities are.

What clubs and activities will sophomores be eligible for and most interested in? Your participation in extracurricular activities is a part of your permanent record. What is a permanent record? Answer this question by giving the meaning of permanent and of record.

SPEAKING ASSIGNMENT: Be prepared to talk on, "Why I plan to belong to a club or participate in another extracurricular activity." Give at least two reasons and then substantiate your ideas. Try to be specific. If you do not plan to participate in an extracurricular activity, insert the word not between plan and to in the title of the topic and proceed with the assignment. Your teacher will give more specific help in planning your talk.

Lesson Five

READING ASSIGNMENT: Pages 16-19

What is the general heading for this particular section of the student handbook? What are specific headings? Some of the specific headings name

people and some, things. How is each person or thing related to a school? Can we say that a school is a business? Why? Make a list of rules that are incorporated in this section of the handbook. Why are they included? Does a business establishment have rules? List some rules that you think are necessary in running a business. Check your rules. Are they stated positively or negatively? Let's read some aloud from both lists. Which ones are more easily understood - the positive or the negative? Which ones are more readily heeded - the positive or the negative? Why?

LISTENING:

1. Invite your principal in for a "Get-Acquainted" meeting. Ask him to talk to you.

2. Invite your counselor in to talk to you. Get into groups ahead of time and prepare pertinent questions for him to discuss with you in a question and answer period. Pertinent questions are those that are practical and that you need answers to now.

NOTEBOOK ASSIGNMENT:

If you recorded any notes from either of the talks of the visitors, copy them neatly in your notebooks.

On a separate page of your notebook write "Listening Skills." List the rules for listening. Word them carefully.

You may add ideas on listening to this section of your notebook from time to time.

Under the section of you notebook labeled Miscellaneous write "Classroom Organization," and with the teacher and other members of the class, write a plan for a practical class routine. Refer to this page in your notebook frequently during the first days of the school term when you are learning to be a good high school student.

BECOMING A GOOD STUDENT

Before beginning the specific lessons to develop study skills, do you have any questions about classroom routines? Attempt to follow the same daily routine in getting the class started. If you will do this each day, you will soon establish the habit of being in your place and ready for work as soon as possible.

THOUGHT QUESTION

Notice the two underlined words - habits, skills - in the introduction to this lesson. What is the difference in meaning between the two words?

Lesson One: Developing Study Skills

If you were asked, "Who is a student?" you would probably answer, "One who studies," and you would be right. A person may become a good student if he practices orderliness in his study habits. Let's see how this can be done. To make this a useful study, plan to apply the study exercises to your English materials. The teacher will give you guides to follow in your study and she will study with you. Before you actually delve into the techniques for studying, look at these true/false statements. They have been planned to help guide your thinking.

_____ 1. Good study skills are natural and do not need to be developed.

_____ 2. Habits and skills are synonymous.

_____ 3. There is no way to improve learning.

_____ 4. Planning to learn more than you will actually need to pass a test is a waste of time.

_____ 5. Interest is not necessarily an important factor in remembering.

_____ 6. You should try to have a regular time for studying.

_____ 7. A good student learns to plan ahead.

_____ 8. A good student "crams" before a test because test grades are important.

_____ 9. A good student studies all school subjects in the same manner.

____ 10. A good student takes a positive attitude towards learning and a positive approach to studying any subject that is in his course of study.

Lesson Two: Textbooks as Tools

LISTENING

Follow the directions of the teacher as she guides you in locating the parts of the textbook.

Use another one of your textbooks and answer the following by filling in the blanks. Write neatly and follow directions carefully.

1. Title _____
   (Underline the title of the book.)

2. Author _____
   (If there is more than one author, write the name of the first one listed.)

3. Publisher _____

4. The index begins on page _____.

5. Copyright date _____

6. Reprint date _____

7. Is the index a good one? Why? (Write your answer in a complete sentence.)

   _____

8. Why is there a period after the blank in item number 4? _____

   _____

VOCABULARY

1. Not all books have a frontispiece, a page of dedication, or a glossary.

2. Every book of information should have a table of contents and a definitive index.

3. No book should be accepted until it is collated.

4. Publishers read manuscripts submitted by many authors.

5. Some writers include much good material in the appendix of a book.

6. A blurb may be considered as a kind of advertisement.

Lesson Three: Taking Care of Books

With the other members of the class devise at least five rules for taking care of books. Think about how you have seen books being handled, and let this thinking be your guide in writing the rules. Are you stating the rules in a positive or negative manner?

NOTEBOOK ASSIGNMENT: Copy the rules neatly in your notebook.

Lesson Four: Introduction of Library Tools

A library is a storehouse of books. Before a person can use a library with ease, he needs to know some of the tools that are provided and how they can help in studying. Chapter 27, page 488, in Warriner's is called "Information in the Library." At the bottom of page 488 there is a list of skills which you should know. Read the list silently to check to see how many of these techniques you already know.

You should know, first of all, that all books are divided into two principal groups, fiction and nonfiction. Fiction includes novels and short stories. Nonfiction includes everything else from books on current events to deep scientific works. Fiction books are put into a section of the stacks separate from the nonfiction books. Read with your teacher on page 489 in Warriner's about "Fiction."

Nonfiction books are classified according to subjects; such as history, science, and art. The classification by numbers, which may seem difficult at first, is really quite simple. Read in Warriner's "Nonfiction: The Dewey Decimal System," on pages 489-90. You should become familiar with the Dewey Decimal System so that you can read the Dewey charts that are in all libraries.

Lesson Five: The Card Catalog

To help you find the books you want without going to the stacks, each library has a card catalog. You should know that the card catalog in a library is for that particular library. On your trip to your library you will want to locate the card catalog first.

The librarian has a way for helping you find a book in the card catalog. You may find a book if you know its subject, or author, or title. In Warriner's on page 491 read about the author card, the title card, and the subject card so that you can distinguish one from the other. Examples of catalog cards are on page 8 in your Student Lessons.

In the upper left-hand corner there is a number that is referred to as a catalog number because it gives the classification of the book. Sometimes it is called a call number because the number identifies a book in the stacks.

Study the catalog numbers and the explanation of each one on page 9. Even though school libraries rarely have a complete catalog number, it is good to know what the different letters and figures stand for.

CATALOG CARDS

AUTHOR CARD

```
400
W83e        White, E. B.
                Elements of the language.
            Chicago, American Book Company,
            1959.
                95 pages

```

F — Fiction

D 55 o

First letter of the author's last name — The author's Cutter number — First letter of the first important word in the title

Example: Oliver Twist by Charles Dickens

B — Biography

C 76 b

First letter of the subject's last name — The subject's Cutter number — First letter of the author's last name

Example: Frank Bell's Biography of Joseph Conrad

973 — Nonfiction (History)

B 19 a

First letter of the author's last name — The author's Cutter number — First letter of the first important word in the title

Example: Charles Beard's American History

The word Cutter in Cutter number is spelled with a capital letter because a man named C. A. Cutter invented a flexible table of numbers to go with initials of peoples' name for identification. Maybe your teacher will bring to class a Cutter table and show you how a librarian uses it.

PRACTICE EXERCISE:

Choose two books and with your teacher's help prepare three catalog cards for each book. Either use 3" X 5" cards or make 3" X 5" slips from your paper. Underline with a red pencil the word that is used as a guide for alphabetizing the six cards you have prepared. Hand the cards in in alphabetical order.

NOTEBOOK ASSIGNMENT:

After your teacher has checked the cards, paste or tape three of the cards of one book on a page in your notebook. Label each card as either author, title, or subject card.

VOCABULARY:

1. A student needs to know the classification of books to be at ease in the stacks of a library.

2. Some people read biographies for pastime.

3. Reading fiction is a good way to spend leisure time.

4. Using the Dewey Decimal System is a technique for classifying books.

5. Reference materials are usually read in a library.

6. Alphabetical listings help the flexibility in the use of library tools.

Lesson Six:
The Readers' Guide to Periodical Literature

You have a copy of "How to Use the Readers' Guide to Periodical Literature." This is a sample of the large Readers' Guides that are in your library. A Readers' Guide is an author and subject index to about one hundred thirty magazines. What do you think is the relationship between a magazine we read and the magazine of a gun? There are five or more meanings of the word "magazine" in your dictionary. Check them. As you become acquainted with the Readers' Guide, try to decide why everyone should know how to use this library tool.

NOTEBOOK ASSIGNMENT:

Keep a record of as many of the class exercises as you and your classmates decide will be useful to you later.

VOCABULARY:

1. Using cross references helps one to write a better bibliography.

2. Several issues of a magazine make up one volume.

3. A cumulative index aids one in finding the periodical he needs.

4. The captions of pictures are fun to read.

5. Many entries may be found in abridged editions of the READERS' GUIDE.

PRACTICE ACTIVITY:

Plan a visit to your school library. Decide ahead of time the questions you will want answered. Even though you have not studied about reference books yet, notice carefully the general encyclopedias and the special encyclopedias (sometimes called cyclopedias) that are in your library. Note the catalog numbers on the backs of the reference books. Ask the librarian about library rules for checking reference materials from the library.

Lesson Seven: Reference Books

Encyclopedias contain information on all subjects, including persons, places, things, and events. They are easy to use because all the subjects are arranged in alphabetical order. These reference books are in several volumes

and there is usually some kind of index to the set of books. What are the names of the encyclopedias in our library? How are they indexed? Your teacher will help you in answering these questions. Look in the card catalog under Cyclopedia and copy the titles you find.

ASSIGNMENT:

Look at the following questions. You can find answers to these questions and questions like them in reference materials. There may be other questions that you are interested in. Decide on two questions. Use the reference materials to answer the questions. Write the answers in sentences of your own. Do not copy the material word for word from the encyclopedia. Write on your paper the source of the information you used to answer each question. You may not find some of the answers in your school library. Choose another question for your assignment. Some time when you are in the public library, you could search for the answers to some of the questions.

1. Who is John Gunther?

2. Who was vice-president of the United States in 1888?

3. What is bauxite?

4. When and where did Rocky Marciano win the heavyweight title?

5. When it is noon in New York, what time is it in Calcutta, India?

6. How many pounds are there in a metric ton?

7. How is a pearl formed? What is a cultured pearl?

8. How does a cuttlefish conceal itself?

9. For what purpose did the Scotch use the "fiery cross"?

10. Today the World Series in baseball is won by the team that is victorious in four games. In 1903 and three other years the champion had to win five games. What were the three years?

11. List 8 precious or semiprecious stones. What other uses have they besides ornamentation?

12. Is the country of Israel in Africa or in Asia?

13. How is the date of Easter Sunday determined?

14. What is chloroform? What are its uses?

15. What are the most important ingredients of the earth's atmosphere?

16. Who are the executive officers of Arkansas?

17. What are driver ants?

18. How do crickets sing?

19. For what is ambergris used? Is it a valuable substance?

20. Who was Sister Kenny?

21. Who was Cecil Rhodes?

22. How many islands are there in the Hawaiian Island group?

23. How large is Alaska? When did she acquire statehood?

24. Where and what are the Tetons?

25. How does an electronic microscope work?

26. How many television sets were made in the United States in 1947? in 1962?

27. How did Buffalo Bill Cody spend the last half of his life?

28. Where and when was Dwight D. Eisenhower born?

29. Who are the U. S. Senators from Arkansas?

30. Who was Davy Crockett?

31. What was Mrs. J. F. Kennedy's maiden name?

32. Of what college was Robert E. Lee president?

33. Whom did George Washington marry?

34. What and where is Chimborazo?

35. Name four books written by Samuel Clemens.

VOCABULARY:

1. We do not copy material verbatim from a book unless we give credit to the author.

2. Several sources of information should be read before a subject is discussed.

3. We used the teacher's bibliography when we were studying reference materials.

Lesson Eight: Dictionaries

Think about this quote: "With words you think and speak and read and write. Imagine a wordless day - a wordless world!" Some people actually sit down and read dictionaries. They read to learn more of the things they know a little something about, to learn of things they know nothing about, and to be amused.

You have a paperback copy of Webster's New World Dictionary of the American Language. Following is a list of questions that can be answered by using your dictionary:

1. What is the grisly origin of the word bonfire?

2. How many square feet are in an acre?

3. Is the word news singular or plural?

4. What does i.e. mean?

5. To what besides a fruit might the word lemon be applied?

6. As what parts of speech may the word saw be used? Name three compound words containing the word saw.

7. Does believe drop or retain the -e when -able or -er is added?

8. What is the Roman numeral for the number ninety?

9. Does the name of the English river Thames rhyme with gems or games?

10. Is the spelling for the plural of the word tool in your dictionary? Do you know why?

Think about the information you have gleaned from the dictionary and make a list of the uses of a dictionary. Someone should write your ideas on the blackboard so all of you can check them. What other kinds of information do you think you will want to know about a word? Discuss your ideas.

Learning to use a dictionary should be approached as though this tool is a do-it-yourself kit. As in assembling a do-it-yourself kit, you take your chances when you do not read directions. If you did not know the answer to the last part of question 10, look at Section III on page vii in your dictionary. Then with your teacher and the other members of the class study carefully pages iv to vii. Different approaches are used in writing different kinds of dictionaries. Before your dictionary or any dictionary you are using can become a useful tool, you must become acquainted with the guide for using that particular dictionary. As you are studying the guide and as you browse through the dictionary, be ready to suggest words and exercises that you can all use for practice until everybody becomes quite familiar with the dictionary.

NOTEBOOK ASSIGNMENT:

Copy verbatim the information in the dictionary of these words: sophomore, shop, raw. Do not crowd your writing. Then label in red the items of information that are in each entry. Refer to this list: (1) spelling (2) pronunciation (3) parts of speech (4) inflections (5) definition (6) etymology (7) derivatives (8) synonym or antonym (9) usage label.

VOCABULARY:

1. Diacritical marks and accent marks are used to indicate the pronunciation of words.

2. The typist must know the syllables of words to be able to hyphenate a word.

3. The schwa is a symbol for unstressed vowels.

4. The formal writer is interested in the usage labels of words.

5. The grammarian is interested in the inflections of words.

6. Some words get into a dictionary through coinage; orthographers decide on the spellings of the words.

7. The user of an abridged or an unabridged dictionary may save time by using the guide words.

8. The meaning of a word, but not its etymology, may be discovered by seeing the word in context.

DEFINITIONS:

Use your dictionaries to find the meanings of the words below. Write the definition using the sentence pattern $NP_1 + VP + NP_2 + Modifier$ as you did when you defined the word log. What do you need to know before you can write a good sentence? What kind of modifier do you use and what does it modify?

student	knowledge	train	education
pupil	wisdom	educate	vocation
scholar	insight	teach	avocation

PRACTICING PARLIAMENTARY PROCEDURE

Lesson One: Introduction - The Main Motion

Parliamentary procedure is properly used wherever people are gathered together to formulate decisions. Parliamentary procedure is necessary if group action is to be accomplished so that the rights of the minority may be respected. When an individual in a group realizes that business is carried on by the will of the majority, he should use his voice to express his ideas.

To be able to express himself in a meeting, a person recognizes and practices some ground rules. Business is introduced and carried out by the proper use of the main motion. Following are three easy steps to follow:

A. Member secures the floor

1. Member rises
2. Member addresses the chair
3. Chair recognizes the member

B. Introducing business

1. Member makes a motion by saying, "I move that..."
2. Motion is seconded
3. Chair says, "The motion has been made and seconded that... Is there any discussion?" (Discussion follows with one person speaking at a time.)

C. Putting the question

1. Chair states the question and asks for the affirmative vote
2. Then the negative vote
3. Chair states the result. Only until then is the motion completed.

Lesson Two: Wording the Main Motion

The purpose of the main motion is to bring business before the assembly in a form in which it may be considered and voted upon. (See p. 17 of Russell's The How in Parliamentary Procedure.)

PRACTICE EXERCISES:

Pretend that you are having an English club meeting. Someone may volunteer to be chairman or the teacher may serve as chairman. Let each student go through the three steps for securing the floor.

The teacher will now write on the board the words, "I move that..." Remember that every motion begins with these three words. Write three motions that

would be pertinent to one of your club meetings. Read the motions aloud and check for this information: Does the wording of the motion begin with I move that? Is there only one idea expressed in the motion? (At this time you may be asked why the last question is necessary when testing a motion.)

Read number 4 on pages 18 and 19 in your book and answer this question: What is the purpose of the seconding of the motion? What happens to a motion if it receives no second?

Discuss with your teacher the importance of the discussion period that follows the seconding of a motion.

Lesson Three: Subsidiary Motions

Recall that all business begins with a main motion properly presented. During the discussion period it may be evident that the idea of the main motion is good, but the idea needs further clarification or limitations. Read pages 23-28 about how to improve the original or main motion. Your teacher will give you practice in amending a motion when you are participating in club meetings.

THOUGHT QUESTION:

Main Motion: I move that we buy new hair dryers for the Cosmetology Department. Is the following amendment proper for this motion? I move that we amend the motion by substituting "the Print Shop" for "the Cosmetology Department." Devise several amendments that would improve the main motion.

Lesson Four: Conducting Meetings

Look in the Table of Contents of your booklet, The How in Parliamentary Procedure, to decide the topics that will help you in this assignment. Choose different people from your class to discuss the topics.

Lesson Five: Testing Your Knowledge of Parliamentary Procedure

Can you answer these questions?

1. How does a member secure the floor?

2. How is new business introduced?

3. What is the purpose of seconding a motion?

4. Say the three words that should begin every main motion.

5. How can committees be a help in carrying on business?

6. Sometimes discussion of a motion will become tiresome. How can you as a member help to keep the meeting from being delayed?

7. Sometimes a motion should be voted on at another time. There are

three ways to delay a vote. Explain the consequences of each method.

8. What does a member mean when he stands and without being recognized says, "Mr. Chairman, I appeal from the decision of the chair"?

9. How can rules be legally violated in a meeting?

10. In writing your logs day by day you have, in a way, been writing minutes of a class activity. What are some guides to follow in writing the minutes of a meeting? Why should minutes of a club be saved during the lifetime of a club?

11. Parts of the table on pages 52 and 53 should be learned by practicing recalling the ideas from time to time.

12. Note the words majority and two-thirds under "Vote Required" and be able to explain the difference.

13. Do you participate in school elections? Why?

14. Next year in English classes you will study American literature with emphasis on the founders of our Nation. As we study the literature of our Country, we realize what our privileges and responsibilities of being an American citizen are.

WRITTEN ASSIGNMENT: Write briefly in prose or poetry on "What America Means to Me Today."

IMPROVING ATTITUDES

Each of us has a role we play. Each of us is a person, a human being. Look in your dictionaries for the etymology of the word person and you will find persona is the root, but there is no definition given of the original word. Persona is a word used for the masks the early actors wore. When we divide the word into its parts we have per and son. Per means "through" and son means "sound."

Actors in Roman and Greek dramas often had to take more than one part in a single performance and for each actor they portrayed they would wear a different mask. The name of such a mask in Latin is persona and since we are in a fashion all actors, the word persona came to mean the part that anyone plays in the world. Finally, it designated an individuality or, as of today, a person. By a similar figure of speech if we impersonate another, we put on a mask.

THOUGHT QUESTIONS:

Who am I behind the mask? How do I "sound through" to other people? What are my strengths? What are my weaknesses?

PRACTICE EXERCISE: THE INVENTORY

Let's begin with the last question: What are my strengths and weaknesses? To answer this question we may need to take a personal inventory. Divide a sheet of paper lengthwise by folding it. On one side list what you consider weaknesses that have affected your personality as a student. On the other side list the strengths that make up your personality. Do this exercise thoughtfully and carefully. Be bold in stating your feelings. Be consistent and positive in your thinking as you write.

Now look at the list the teacher gives you. Check (✓) the ones you think apply to you. Place a plus sign (+) by those traits you would like to acquire, and place a minus sign (-) by those that apply to you sometimes. The teacher will explain the directions that are written on the two other sheets of the inventory.

Now that you have completed various inventories of your attitudes, think about why we would talk about attitudes in an English class. Refer to the discussion on person at the beginning of this unit. The word personality is a derivative of person. Is personality a noun or an adjective? How do you know? What does the word mean? What is the relationship between the word personality and the word individuality? Think about this statement and apply it to yourself: I am the most important person that I know. Do you agree with this statement? Try your ideas out in a discussion with others in the class. See if you can reach a conclusion on whether the statement is true.

VOCABULARY:

1. A pessimist is an unhappy person.

2. An optimist can usually face a disappointing event with a smile.

3. Some people are introverts and some are extroverts.

QUESTIONS FOR DISCUSSION:

1. What is the difference between a positive and a negative attitude toward studying? toward working?

2. Which attitude will more often lead to success? Why?

3. Which attitude, the negative or the positive, toward life requires more courage? Why?

NOTEBOOK ASSIGNMENT:

Copy this poem in your notebook. Ask the teacher to read it aloud to you, and then you may read it several times to get the meaning. One interesting thing about reading poetry is that you probably will not get the same meaning from the poem each time you read it.

THREE KINDS OF COURAGE

There's the courage that nerves you in starting to climb
the mount of success rising sheer;
And when you've slipped back, there's the courage sublime,
that keeps you from shedding a tear.
These two kinds of courage, I give you my word, are worthy
of tribute - but then,
You'll not reach the summit unless you've the third - - -
the courage to try - it - again!

Roy Farrell Greene

THOUGHT QUESTION

Can you see any relationship between the poem about courage and your taking a personal inventory?

LOOKING TOWARD A CAREER

Our lives are gauged by our attitudes. Attitudes mirror our likes, dislikes, fears, and interests. Other people notice these things about us. For us to know ourselves we need to recognize our attitudes, our strengths, our limitations, and our goals. The unit on "Improving Attitudes" has been a step toward helping us to know ourselves. This new unit is called "Looking Toward a Career." Would "Choosing a Career" be a better title? Discuss the differences in the meanings of the two titles.

Lesson One: Recognizing Your Personality

What do you want most from a lifetime job - money? satisfaction? enjoyment? success?

What factors are involved in selecting a suitable career? Probably you have not given much thought to the future and its possibilities for you. Maybe you think that as sophomores you have plenty of time to decide about a vocation. Let us think about this. You have noted that our discussion of your schedules has indicated that we need to choose courses carefully to be sure that we are taking proper steps toward receiving a diploma. You have analyzed your strengths and weaknesses and have noted your attitudes in general.

WRITTEN ASSIGNMENT:

Think about yourself and write for your teacher a brief analysis of yourself. This is not an autobiography; it is an attempt on your part to identify your personality.

Lesson Two: Projecting Yourself into a Work Situation

We have in the room some books that contain discussions of different vocations. If there is a vocation that you are already interested in, then you may be ready to select a book now. Ask yourself these two questions to guide your thinking: What occupation am I fitted for? What kind of occupation would I like?

READING:

Begin your reading with the idea that you are exploring the possibilities and the potential of a career. Try to imagine yourself doing the job as it is described. This exercise is not designed for you to decide on a career today, but is designed to help you to guide yourself into choosing a career that will give you a great deal of personal satisfaction. Discussions in your other classes, especially the classes designed to help you develop work skills, will be quite useful in guiding you to a particular kind of job.

THOUGHT QUESTIONS:

Do you know a person who is in an unhappy work situation?

Is it too late, do you think, for him to change jobs? Why?

What seems to be his attitude toward other things in life besides his job?

Lesson Three: Planning Your Career

Following is an outline that may be used for an oral or a written report on your reading.

I. Why I think I would like this occupation

II. Nature of the work involved in this job

III. Qualifications

A. Physical requirements
B. Educational requirements
C. Psychological requirements
D. Duty requirements

IV. Future of the job

A. Salary
B. Advancement
C. Tenure
D. Working conditions

V. Why I think I would/would not like to pursue this job

A. Advantages
B. Disadvantages
C. Necessary attitudes

Lesson Four: Identifying Yourself in a Work Situation

There are on the bookshelves many stories of people who have achieved in some way. We can say that they are success stories. This brings to mind a question: "What do we mean by success in life"? One may very well ask also, "How is success measured"? Helga Sandburg has said that success is measured by oneself. The mentioning of oneself reminds us of our discussion of individualism and persona. Many people are able to wear a mask of success and hide a record of unsuccessful attempts. An understanding of oneself becomes even more important as a person advances in a career. As you read the stories of people who have succeeded easily and of those who have overcome adverse circumstances to achieve, think about this quote from Somerset Maugham: "The common idea that success spoils people by making them vain, egotistical, and self-complacent is erroneous; on the contrary, it makes them, for the most part, humble, tolerant, and kind. Failure makes people cruel and bitter."

READING, WRITING, AND LISTENING:

As you read the success stories, try to recognize the problems that these people face. Write about these problems in your own words. Share your writings with the others in the class. Be ready to comment on how the problem is solved. Try this: Read your identification of the problem. Then say to the other members of the class, "How would you have solved the problem?" Listen carefully to the comments by your classmates. As soon as the "ball quits bouncing" (the discussion lags), tell how the character in the story solves the problem. You and your classmates, if you identify yourselves with the people who have problems, will probably have some better solutions than those written in the stories.

SUPPLEMENTARY READING

Included with your lessons is a book list categorized according to subject matter. You should read the titles frequently so that you will recognize the books when you see them in a library or in a bookstore.

You will want to keep a record of what you have read. Following are some questions you may answer in keeping a reading record that can be shared with other students:

1. What idea was the writer attempting to impress upon his readers?

2. What is your own personal reaction to this book?

3. What further reading would you like to do as a result of this reading experience?

4. Would you recommend this book to a friend or classmate? Why?

READING NEWSPAPERS

Lesson One: The Front Page

Bring to class old newspapers that can be cut. You will need Sunday and daily editions. Your teacher may ask you to bring scissors and paste.

We are going to study the makeup of newspapers so that we can read them more easily and quickly. First let us look at the front page. What type news stories are there?

Read the first sentence of a story that attracts your attention. What questions are answered for the reader? What questions are unanswered?

Now look at this list and see how many of these questions are answered for you: Who? What? When? Where? How? Why? Who says so? If these questions are not answered in the first sentence, continue reading through the first paragraph. The part of the story that answers these questions, or most of them, is called "the lead."

LISTENING:

Listen to what your teacher says about the lead of a story. She will probably dictate some ideas about leads that she wants you to write in your notebook for future reference.

ASSIGNMENT:

Find on the front page of a newspaper a story that you understand. Cut it out and paste it on a sheet of your writing paper. Copy the questions that test the adequacy of a lead; use words from the lead sentence or paragraph for the answers.

Read the following test for the adequacy of a lead: Does it give in summary the bare outlines of the story - everything that the busy reader would want to know if he could read only the lead? Now write two or three sentences of your own, telling your decision about the adequacy of the lead of the story you are working with, or choose another one for practice. You may have decided to work in groups for this assignment so that you can share ideas about the leads in several stories. Make individual decisions about the adequacy of the lead of the article you choose for your assignment.

Re-read the article you have pasted on your paper. Underline colorful words. Note the extra details that are in the story. How necessary are these details to an understanding of the story? Comment on the structure of the sentences. Are the sentences effective? Why?

Lesson Two: The Editorial

Cut a brief editorial from the editorial page of a daily paper and paste it on a sheet of paper. What is the editorial about? What other materials are on the editorial page? Especially note the cartoon and its caption. Is it timely? Clip the title and copyright data found on the editorial page.

In a Sunday paper, where does one find editorials? This part of the paper is referred to as a section. Clip from the editorial section the following items. Paste them on sheets of paper and label each one. What part of the editorial section of the paper would some people probably want to save? Clip these:

1. An article on entertainment
2. An editorial of national source
3. An editorial of state source
4. A short book review
5. An entertainment advertisement
6. Table of best sellers
7. One feature story

Lesson Three: Other News Items

Clip and paste on sheets of paper one of each of the following. Label each clipping correctly.

1. An obituary
2. A notice of a meeting
3. An accident story
4. An announcement of a business personal promotion
5. A wedding announcement

Lesson Four: The Sports Story

Find a brief sports story. Clip it and paste it on a sheet of paper. Criticize the story for clarity, colorful words, and interest.

Lesson Five: Advertisements

Clip several want ads for employment that interest you. What items of information are found in the ads that interest you? Is the salary a good one? On what ideas are you basing your answer?

WRITTEN ASSIGNMENT:

Try writing a want ad in which you are advertising for employment. Use either the employer or the employee viewpoint.

Lesson Six: Summary and Evaluation

You may have suggestions for activities that you think you and your classmates will enjoy doing. Your teacher will have suggestions, too.

READING LITERATURE: UNDERSTANDING POINTS OF VIEW

Lesson One: Differences in Points of View

The story "Without Words" on pages 92-100 in your textbook is one about individual personalities. As you read the story, especially note their attitudes toward stealing and killing.

NOTEBOOK ASSIGNMENT

Label a section of your notebook "Reading Literature."

Write the title of the story you have read and the page on which it is found. From your analyzation of the two characters, Jan and Mathieu, try to draw conclusions about why their viewpoints are different. Record the reasons.

Lesson Two: Listening and Discussing

Read "A Man Who Had No Eyes" by MacKinlay Kantor on pages 101-103 in Perspectives. Then discuss with your classmates the idea that even though both men are blind, their achievements are different. How do you account for the differences?

LISTENING

Listen as the teacher reads a story about a grouchy man. Try to decide how there can be different ideas about grouchiness.

Lesson Three: Time Changes Ideas

You will remember reading a poem "Three Kinds of Courage" and being told that we have different points of view about poetry because we are individuals. With your teacher read and discuss two poems: "Sea Love" by Charlotte Mew page 111 in Perspectives and "About Crows" by John Ciardi page 118 in Perspectives.

NOTEBOOK ASSIGNMENT

1. Discuss further with other class members your ideas on why there are different points of view about the same subjects. Write in your own words what you have learned about differences in viewpoints. Be quite specific in naming causes.

2. To test your ability to determine basic reasons for differing points of view, make a list of characters we have studied in this unit and write two-sentence biographical sketches of each one.

READING LITERATURE: MAKING INFERENCES

Lesson One: A Study of Contrasts

Characters are people. They reveal themselves in the stories through what they say and do. A careful reader can learn to make inferences from what he reads in the stories and become aware of the human traits in characters. In other words, reading literature can become a living, practical art. We have learned in analyzing ourselves in this class that we all have problems that must be faced. As we go more deeply into our study of literature, we realize that the problems of people fall into identifiable categories.

Read the non-serious essay on pages 564-565 entitled "From a Boy's Point of View." Try reading between the lines and question your classmates as all of you discuss the questions in the text on page 565. Your questions may be worded, "Why do you answer in this way?" or "Which word clue did you use to arrive at your answer?"

"Stranger On the Night Train" on pages 267-271 is an intriguing story about war and the Czechoslovakian border. You may want to take turns reading the story aloud to each other.

Your teacher will guide you in noting some of the contrasts in the story. After discussing this particular story, you may want to talk about the significance of the expression "behind the Iron Curtain."

THOUGHT QUESTIONS

Do we have any "Iron Curtains" in America?

How free are we?

How free should we be?

Discuss freely this idea: Freedom carries responsibility.

WRITTEN ASSIGNMENT

Write a character sketch of someone you know quite well. Think carefully before you write about <u>one</u> outstanding trait that identifies the person as an individual. Be rather sly by relating anecdotes that reveal the actions of the person that give clues to his character. Placing the person in situations with other people and relating their conversations will be another way for revealing character traits.

READING LITERATURE: FINDING THE CENTRAL IDEA

There will be many times that you will want to read quickly for information. To do this you should learn to pick out the main ideas in paragraphs. In some of your textbooks, the headings of the paragraphs indicate the main idea. Most of your reading for information will be done in periodicals and not in planned textbooks. With practice you can learn to read informative materials rather rapidly. One key to reading of this kind is to avoid reading every word. Read by paragraphs for the central idea. On pages 550-561 in Perspectives there are interesting exercises to help you to develop the skill of recognizing the central idea. In your last writing assignment you were conscious of emphasizing one identifying trait of a person and then supporting your idea with appropriate details. This same plan may be followed in reading for information.

There is a section in Perspectives on pages 209-249 entitled "Spaceways." The stories are timely and exciting. Today we are all interested in outer space - the frontier of the twentieth century. You may want to collect materials on outer space that you can share with others. Too if there are ideas and terms that you read about that you would like to do research on, the teacher will give you time for extra study. Now that you know how to use the Readers' Guide to Periodical Literature, you can easily locate recent articles on topics related to outer space.

READING LITERATURE: IMAGERY AND FIGURATIVE LANGUAGE

Lesson One: Inanimate Objects as Images

One of the best stories in Perspectives is a story about a plan for peace, "Papa and the Bomb," on pages 411-420. The inanimate objects such as a ruler, a coffee can, a cake, a clock, bowling jackets and shoes, etc., serve as images that carry meanings for all of us. As you read the story, take time to enjoy the language used by the members of the family.

THOUGHT QUESTIONS

Papa objects to clocks and rulers and uses them as springboards to his criticisms of civilization. What are his criticisms? Do you agree with them?

Lesson Two: Recognizing Figures of Speech

Now that you have studied with your teacher about how figurative language is used for comparisons and you can distinguish between literal and figurative statements, you will enjoy reading "My Country" on pages 405-409. The teacher will read the introductory lines on page 404. The questions and the implied answers are clear. The situation, "Here lies an American soldier; he is dead," is also clear. Choose two good readers in the class to read "His Sister Speaks" and "His Teacher Speaks." Ask the teacher to read aloud the last part of the poem, beginning with line 70.

THOUGHT QUESTIONS

The first four questions on page 410 may be used as a guide for class discussion. The author seems to believe that the "secret of liberty" may be found in the graves of dead soldiers. What is this "secret" of freedom? To answer this question satisfactorily, you may need to paraphrase the last seventeen lines of the poem. Paraphrasing means to determine in your own words the meaning of each line of a poem. Locating the end marks of punctuation and recognizing the action words will help you to understand the meaning.

READING LITERATURE: RELATIONSHIPS

Lesson One: Relating Inferences and Relationships

The story "After Twenty Years" on pages 311-313 in Perspectives was written by O. Henry. Read the brief biographical sketch of him on page 313. Pause as you read the story; and, by drawing careful inferences from the actions of the policeman and the conversation of the man from the West, try to decide how the story will end.

THOUGHT QUESTIONS

What clues do you have about how the story will end? Answering the questions in the textbook on page 313 will aid your thinking.

What are some events or circumstances that can complicate decisions of policemen?

Lesson Two: The Significance of Titles of Stories

"The Long Shot" on pages 351-359 is the story of a policemen who faces a decision. This is a gripping, terrifying story; so read it without stopping.

THOUGHT QUESTIONS

The title "The Long Shot" literally refers to the shot which Officer Henderson must fire across the street. What is the deeper suggestion of the title?

Lesson Three: Relationships--Cause and Effect

"Frame-up" on pages 15-33 is in a sense a detective story. See if you can figure out before Jimmy does what really happened to cause the accident.

THOUGHT QUESTIONS

What causes Jimmy to be so determined to search for the witness? Why does he falter or almost give up? Discuss the family relationship in this story. Is it unusual?

Lesson Four: Relationships--Comparison and Contrast

Listen as the teacher reads "The Scrub Oak Tree" by Herbert Merrill on page 182. Then you read the poem as though it is a short short story paying attention to end marks of punctuation. After you think you know the meaning, answer all of question one. Now you are ready to enter into the class discussion on comparison-contrast.

Turn to page 109 and read "The Mate" by James Stokely. Your teacher will give you time to read and to think about the poem. Before entering into a class discussion of question four on page 110, ask your teacher to read the poem aloud. Her stresses on certain words and her interpretation of the poem will help you to clarify your thinking on the meaning of the poem.

THOUGHT QUESTIONS

Does the boy in "The Mate" seem younger than sixteen? Why? The poem, "The Scrub Oak Tree," really has two meanings. The author describes an acorn planted in rocky soil, but he is actually suggesting through an image a broader idea about life in general. What are some of the conclusions about life in general that you think the author wants you to draw?

INTRODUCTION TO LANGUAGE

Now that we have listened to recordings of the speech of different people, we recognize that nearly all of us pronounce our words a bit differently from other people. Our ability to speak words distinguishes us from lower animals. Let's think back: How did we learn to talk? Why did we learn to talk? Why did we decide that certain words refer to or are names for objects? Let's say a few words and then see if we all have the same picture in our minds when we hear the word. Think of these words and the suggest others for you and your classmates to use in this exercise: chair, car, dish. These are words for tangible objects with which you are all familiar. The reason we have different ideas about these words is that these are general words. We would have difficulty communicating if we went around saying just words. Suppose we said these words in this order: bought, man, the, car, a. In our recording we understood each other. Why? (The order in which words are said is important.) English is a language that is dependent on word-order in sentences to be understood. Look at these pairs of sentences and note the differences in meanings:

1. Joe hit Bill.
1. Bill hit Joe.
2. The pretty girls in the choir sing on Sunday.
2. The pretty girls sing in the choir on Sunday.

In our next lessons we are going to study word order in sentences beginning with what we call kernel sentences. To understand the lessons we will need a vocabulary which we are including here. The words and signs will seem a bit queer to you until you and your teacher use them. Then they will be fun to use because they are easy to remember.

A. Kernel Sentence

$S \longrightarrow NP + VP$

S = *sentence*
$\longrightarrow$ = *may be written as*
NP = *noun phrase*
VP = *verb phrase*

B. Noun Phrase

NP = *proper noun, personal pronoun, indefinite pronoun, or Det + N*

proper nouns = James, New York, the United States . . .
personal pronouns = I, he, she, it, we, you, they
indefinite pronouns = everyone, everybody, everything; someone, somebody, something; no one, nobody, nothing; anyone, anybody, anything

Det + *N*

Det = article ⟶ definite = the

or

nondefinite = a/an, some, or null

or

demonstrative ⟶ singular = this or that
or
plural = these or those

N = count + plural
or
noncount

C. The Verb Phrase

VP ⟶ Aux + be + *NP* / *adjective* / *or adverb*

or

Aux + verbal

Aux ⟶ *tense* + (*modal*) + (*have* +*part*) + (*be* + *ing*)

tense = *Pres* or *Pas*
modal = *can*, *will*, *shall*, *may*, or *must*

verbal ⟶ V_t + NP
V_i + *adv*
V_b + NP *or adjective*
V_s + *adjective*
or V_{mid} + NP

KERNEL SENTENCES: THE NOUN PHRASE

Look up the word kernel in your dictionary. Which definition do you think fits our idea of a kernel sentence? The kernel sentence contains the subject and predicate which are the core of any sentence.

Look at these sentences in which an action is named. Fill in the blanks with appropriate-sounding words:

The _____ walks.

A _____ walks.

Some _____ walk.

_____ walk.

That _____ can walk.

In each of the sentences you have named a person or animal that walks. Each name is a subject in a sentence. Your teacher is going to flash on the screen some kernel sentences which will give you practice in picking out subjects, which we shall call noun phrases, and predicates, which we call verb phrases. Refer to Section A of your vocabulary sheet. Copy this part in your notebooks, and write some kernel sentences to help you to understand that a sentence is a NP + VP.

Lesson One: Proper Nouns, Personal and Indefinite Pronouns

Discuss with your teacher Section B of the vocabulary Sheet. Help her to list different proper nouns, personal pronouns, and indefinite pronouns. You may want to test yourself when you are listing I, he, she, it, you, and they to see if you can name all the forms of first person I and use them in sentences. Then you could do the same for second person you and third person he, she, it.

ASSIGNMENT

Writing sentences of your own will help you to check yourselves to see if you understand subjects and predicates.

Lesson Two: The Noun in Det + N

Det is a sign for determiner. The word determiner is particularly useful since it is used as a label for those words that always signal that a noun is following. Certain words pattern with nouns and these words (determiners) are noun markers. Your teacher will discuss definite and indefinite articles with you in this lesson. Refer to Det in Section B

of your vocabulary sheet. Is the word demonstrative a new word for you? When you note that the demonstratives are this, that, these, those, you can decide for yourselves their use. Make some sentences using demonstratives as determiners and ask your teacher if they are right.

ORAL AND WRITTEN COMPOSITION

It should be easy to describe something that you are holding in your hand and that all the listeners can see. You can fall into a trap because when you have the object before you you may say, "This part here . . . ." The object of this lesson is to help you to be specific and call all items by their proper terms. You are really a "teacher" describing a tool and how it works so that your "students" can explain what they have learned to someone else. Your listeners may want to explain a tool which they do not have near them, and they will need exact terms for their descriptions.

KERNEL SENTENCES: THE VERB PHRASE

Lesson One: The Verb be

The verb phrase in Section C of the vocabulary sheet looks rather complicated. It really is not. Probably the verb we use most often is the verb be. This verb changes its form to indicate person, tense, and number. Following is a table that may help you. You need not memorize it, but be sure you understand its meaning. Proper nouns are usually used as third person as, John is here.

Present Tense

	Singular Number	Plural Number
1st person	I am	we are
2nd person	you are	you are
3rd person	he (she) (it) is	they are

Past Tense

	Singular Number	Plural Number
1st person	I am	we were
2nd person	you were	you were
3rd person	he (she) (it) was	they were

As the teacher goes through the lesson, check the formulas for the verb be in Section C on the vocabulary sheet. Be sure to ask questions so the teacher can re-explain the ideas she is teaching you.

The teacher will write these sentences on the board and ask you to decide which sentences contain the verb be. Remember the verb be must be followed by a NP, an adjective, or an adverb of place.

1. The man is looking for you.
2. They were here yesterday.
3. Joe had been waiting for us.
4. The teacher is kind.
5. The teacher is talking to her class.

Be sure you understand these sentences before the teacher begins the discussion on auxiliaries and verbals. All you need to know about the auxiliary at this point is that it is a helping word.

THE VERB PHRASE: THE VERBALS

Lesson One: Transitive Verbs

Look at these sentences. In each one there is an actor, an action, and a receiver named.

1. Mother broke the vase.
2. She dropped her purse.
3. Some people are studying their lessons.
4. James will tell the story.

If we divide these sentences into NP + VP, the lines would come after Mother, She, Some people, and James. Note that in the verb phrase there are an action and a receiver named. These verbals are referred to as V_t + NP (action + receiver). V_t = transitive verb.

Lesson Two: Intransitive Verbs

In the following sentences there are no receivers of action; however, there are differences in the make-up of the verb phrases. See if you can relate these different make-ups to the terms for verbals as listed in Section C of the vocabulary sheet.

Lesson Three: The Verb have

You have now noted all the verbals except one: V_{mid} + NP. To understand this one look at these two sentences:

1. James has a car.
2. James has broken the rules.

Test to see if the VP is V_t + NP by putting the receiver in the subject's place. Sentence 1 will not pass the test. We say that VP containing the verb have are V_{mid} + NP.

THE VERB PHRASE: THE AUXILIARY

The word morpheme will be new to some of you. It is a single unit of meaning. Morph means form, and a morpheme is the smallest word or part of a word that indicates meaning. The auxiliary in the verb phrases indicates the form of the verb be or of the verbal in the verb phrase. The first item in the auxiliary is tense which may be either present or past. Check this item in Section C of the vocabulary sheet and remember to choose either Pres or Pas for the first element in the VP. Also, remember that Pres or Pas is a morpheme that affects only the element immediately following it in the VP.

Lesson One: Present and Past Tense of the Verb be

The grammatical concept of tense has to do with form, not with meaning.

The verb be is an example of this idea; it changes its form to indicate tense. Tense indicates the relationship of the time of action and the time of the speaking or writing about the action in a sentence.

Copy the following material in your notebook. Remember Pres and Pas are morphemes that change the form of words to which they are added:

1. be + Pres = am when the NP is I
2. be + Pres = is when the NP is he, she, it, a proper noun, an indefinite pronoun, or a Det + N when N is not plural
3. be + Pres = are in all other cases
4. be + Pas = was when the NP is I, he, she, it, a proper noun, an indefinite pronoun, or a Det + N when N is not plural
5. be + Pas = were in all other cases

ASSIGNMENT (Oral)

Make sentences to illustrate the ideas above. Listen as others read their sentences above for errors. You are learning that a subject and verb must agree in person and number.

ASSIGNMENT (Written)

Remember that the noun in Det + N may be either a count or a noncount noun. If the noun can be counted, we simply mean that it has a plural form. The morpheme for plural is s: boy + s = boys; man + s = men; sheep + s = sheep. The symbol # stands as the marker of the beginning and end of a word. Write these sentences. Spell the words as the morphemes indicate they should be. Punctuate the sentences correctly.

1. # the # man + s # Pres + be # here #
2. # somebody + Ø # Pres + be # in the room #
3. # the # principal + Ø # Pas + be # worried #
4. # Jim # Pres + be # president # of our class #
5. # the # desk + s # Pres + be # in the hall #
6. # our # neighbor + s # Pres + be # kind #
7. # the # tool + s # Pas + be # in the shop # yesterday #

Write the sentences carefully. Either the teacher or you will correct your paper. Be sure you understand how you made errors, if you did make some.

Lesson Two: Other Elements in the Auxiliary

Looking at the vocabulary sheet we find that Aux ⟶ tense + (modal) + (have + part) + (be + ing). The word tense is not in parentheses because every verb phrase must include either present (Pres) or past tense (Pas). If there is a modal in the verb phrase, it will follow tense. The common modals are can, will, shall, may, must. Pres does not change the form of these modals. Must is always Pres + must. Pas changes the following modals:

can + Pas = could	will + Pas = would
shall + Pas = should	may + Pas = might

Next in order is (have + part) which may be used. Understanding this element in the auxiliary helps us to say I have taken the test, He had seen me earlier . . . . (Be + ing) may follow next in the order of the auxiliary. If the verbal has an ing it will be preceded by (be + ing); as, She is coming to our house, My mother was waiting for me.

ASSIGNMENT

Copy these sentences. Indicate the attaching of the morpheme to the word following it in the VP. (Remember the morphemes are Pres, Pas, part, and ing in verb phrases.) Then write the sentences punctuating them correctly. Example:

John + Pres + have + part + be + ing + study
John + has + been + studying
John has been studying. .

1. John + Pres + will + study + his lessons

2. John + Pas + run + to school

3. John + Pas + be + at home

4. John + Pres + be + ing + wait + for me

5. John + Pas + will + see + me

6. John + Pas + shall + be + ing + work + in the shop

7. John + Pas + have + a car

8. John + Pres + be + kind + to his mother

9. John + Pas + may + have + part + be + ing + listen + to the teacher

10. John + Pres + be + ing + play + the piano

STEINBECK'S *THE PEARL*: A STUDY OF AN AUTHOR'S USE OF LANGUAGE

INTRODUCTION

For class use you will each have a Bantam Pathfinder Edition (ED78) of The Pearl by John Steinbeck. Steinbeck is one of the best storytellers we have had in America. You may be interested in reading about him during a library period.

PROCEDURE

The teacher will read the first chapter to you and will point out some ideas in the story that you might not notice on a first reading of the story. After you have studied the first chapter, the teacher will ask you to choose some topic that you can concentrate on while you are reading the rest of the story. Try to look at your topic in two ways: (1) Relate the actions and feelings of the people to what you know about the actions of people today that express their feelings. (2) Especially note the language the author uses to help you to understand the story.

Here are some topics that you may want to discuss. You should feel free to suggest other topics as you continue the study:

1. Bared emotions shown throughout the actions of characters
2. Folk beliefs and folkways
3. The different dawnings of new days
4. Songs and music
5. Sensory descriptions
6. Narrated incidents

Anytime the class is having a discussion on some of the ideas listed above, you should offer your ideas freely.

THOUGHT QUESTION

There is not much conversation in the story, but the reader feels that there is communication among the characters. How do you account for this?

SHAKESPEARE'S USE OF LANGUAGE: JULIUS CAESAR

Lesson One: Improvisations

Your teacher will give you a list of various situations which you may use for enacting impromptu skits with your classmates. Read them carefully and decide how you would re-create the situations.

Lesson Two: Reading the Play

You are about to read a play about the assassination of Julius Caesar, a great Roman leader. The historical events in this play occurred during the years 44-42 B.C. However, this particular account was written by William Shakespeare in 1601. Julius Caesar is an exciting story. Murder, conspiracy, rioting, battles, and ghosts all have their place in a drama full of action and suspense and tragedy.

As you read, you will become well acquainted with some of the characters in the play. You will meet noble, gentle Brutus, whose motive for killing Caesar was honorable, and jealous, spiteful Cassius who wanted Caesar dead because he hated him. You will also meet Mark Antony, Caesar's trusted lieutenant, whose oratory stirred the citizens of Rome to rioting and murder and who later tried to cheat them out of money Caesar had left them in his will. You will meet the great leader himself, Julius Caesar, who is returning as the brilliant and triumphant dictator of Rome, but who possesses one overwhelming ambition--to be crowned emperor!

You will probably want to reflect upon and think seriously about some of the universal questions Shakespeare asks in the play. Does the end justify the means? Is murder ever right? What are the qualities of true leadership? Should a man be honorable at the expense of being practical? Or should he take a practical approach to life and forego honor? These are some of the questions which will occupy your thinking. They are often called universal because people in every age of history have had to answer them. You will be interested to see how Shakespeare's characters answer these and other questions.

You should decide with your teacher how you would like to read the play. Perhaps you would prefer to be assigned parts to read aloud in class or maybe you would prefer to listen to tape recordings by other students. Whatever you decide, keep in mind that the purpose of the reading is for you to receive maximum enjoyment and meaning from the play.

Lesson Three: Thinking About the Play

As you read the play Julius Caesar, several questions will probably come to your mind. Below are given some study aids to guide your thinking as you

read. Your teacher will assign them to you or use them for class discussions.

ACT I

1. Contrast the attitudes of Flavius and Marullus and the attitudes of the common people with regard to Julius Caesar.

2. Caesar is presented as a magnificent figure; yet he has certain defects. What are these defects and how does Shakespeare reveal them to us?

3. Why do you think Shakespeare had the Soothsayer appear when he did? Look up the word "foreshadowing" and relate its meaning to the above question.

4. Why is Cassius determined to have Brutus join the conspiracy against Caesar?

5. Why do you think Shakespeare included details of strange, supernatural happenings on the night of March 14?

ACT II

1. Brutus persuades himself to join the conspiracy against Caesar. By what reasoning does he decide to do this?

2. After reading the conversation between Brutus and Portia, write your impression of Portia.

3. Why does Cassius want Antony to be killed? Why does Brutus refuse to allow a second murder?

4. Caesar decides not to go to the capitol, then decides to go. Who and what are responsible for his change in plans? In answering this question do you find evidence of character traits in Caesar that could be dangerous?

5. Why do you think Shakespeare included Scene 3 in the play?

ACT III

1. In what way does Caesar reveal his pride and conceit at the beginning of Act III? How does he reveal his political power?

2. What does Caesar mean when he says, "Et tu, Brute?"

3. Following the assassination the conspirators smear themselves with Caesar's blood. Why? How can this be called a "symbolic" act?

4. Your teacher will help you analyze the speeches of Brutus and Antony. Can you determine why Antony's speech had more effect on

his listeners than Brutus'? Find as many contrasts as you can between the two speeches. Would a modern day crowd react the same or differently to both speeches? Explain your answer.

5. What does the killing of Cinna reveal about the effect of mob violence?

ACT IV

1. Relate the event which caused the quarrel between Brutus and Cassius.

2. Explain the battle plans of Brutus and Cassius. Which was more practical?

3. Why do you think Shakespeare included the ghost scene at this particular time?

4. In Act IV we receive glimpses of Brutus' warmth and compassion. How are these qualities illustrated?

ACT V

1. Describe as best you can the battle strategy followed by the armies.

2. Describe in detail the event which caused Cassius to kill himself.

3. How do we know that even Brutus' foes had deep respect for him?

WRITING AN AUTOBIOGRAPHY

Lesson One: Recalling the Personal Inventories

In the units "Improving Attitudes" and "Looking Toward a Career" each of you took an inventory of your strengths and weaknesses. All participated in interesting discussions about how attitudes are revealed in our relationship with other people and how each one of us plays a role in life. When we were studying about careers we understood that our attitudes mirror our likes, dislikes, fears, and interests and present us as individuals to other people. Each of you wrote a brief analysis of yourself. At this time read again what you wrote. As you read, ask these questions of yourselves: Is this me? Have I changed in anyway? What influences in my life have made me what I am?

Lesson Two: Choosing a Moment to Remember

Think of an incident or experience or a moment of thought that is vivid to you because you were affected by the experience so that it changed your course in life or your attitude toward something. As you write your thoughts, express yourself freely. Consciously try to picture your feelings in words that will help the reader visualize what you are saying.

Lesson Three: Expanding the Moment

Analyze the meaning of the paragraph you have written. What is its central idea? Is it centered around one person, one sport, one time (year, day, month)? Is its central idea one that describes a deep feeling like hatred, jealousy, respect, gratitude, shame, humbleness?

Lesson Four: Writing the Theme

Now try writing an introductory paragraph that will be a general discussion of your central idea. Following are some samples of introductory paragraphs[1] that other students have used for writing autobiographies.

Good Times in Our Jalopy

Our family has had some wonderful good times in our old jalopy which Dad bought for $50 five years ago. It is a 1941 Mercury. Dad and I worked on it together. He taught me how to take a motor apart. We painted it a fiery red. Then it was ready for family trips and good times which I shall never forget.

---

[1]Don M. Wolfe, Creative Ways to Teach English, (New York: The Odyssey Press, 1966), p. 82.

My Hobby: Electric Trains

When I was eight years old, my father bought me a small electric train for Christmas. Since then my family has given me five other trains. From this hobby I have learned many things about railroads, electric motors, and railroading signals. In this theme I shall describe five moments when this hobby gave the greatest pleasure.

Discuss these opening paragraphs with your teacher and ask some questions about how you can introduce your central idea so that it can be expanded into four or five paragraphs.

EVALUATION

Revise and rewrite your theme so that your sentences are effective and are properly punctuated.

PREFACE

This book is designed to serve as a basic reference in the field of first aid. Since all naval personnel are required to have a knowledge of the principles of first aid, it is expected that this book will be of value to both officers and enlisted men of the Navy. The course is designed for individual study, but may also be used as a basic text for group instruction in first aid procedures. Although the general principles of first aid are, of course, equally applicable on board ship and at shore activities, primary emphasis has been given in this book to shipboard first aid problems.

As one of the Navy Training Courses, this book was prepared by the Training Publications Division, Naval Personnel Program Support Activity, Washington, D. C., for the Bureau of Naval Personnel. Technical assistance was furnished by the Bureau of Medicine and Surgery.

THE UNITED STATES NAVY

GUARDIAN OF OUR COUNTRY

The United States Navy is responsible for maintaining control of the sea and is a ready force on watch at home and overseas, capable of strong action to preserve the peace or of instant offensive action to win in war.

It is upon the maintenance of this control that our country's glorious future depends; the United States Navy exists to make it so.

WE SERVE WITH HONOR

Tradition, valor, and victory are the Navy's heritage from the past. To these may be added dedication, discipline, and vigilance as the watchwords of the present and the future.

At home or on distant stations we serve with pride, confident in the respect of our country, our shipmates, and our families.

Our responsibilities sober us; our adversities strengthen us.

Service to God and Country is our special privilege. We serve with honor.

THE FUTURE OF THE NAVY

The Navy will always employ new weapons, new techniques, and greater power to protect and defend the United States on the sea, under the sea, and in the air.

Now and in the future, control of the sea gives the United States her greatest advantage for the maintenance of peace and for victory in war.

Mobility, surprise, dispersal, and offensive power are the keynotes of the new Navy. The roots of the Navy lie in a strong belief in the future, in continued dedication to our tasks, and in reflection on our heritage from the past.

Never have our opportunities and our responsibilities been greater.

CHAPTER 1

GENERAL INSTRUCTIONS

First aid is the emergency care given sick or injured persons. Emergency care must not take the place of proper medical or surgical treatment, but should consist ONLY of furnishing temporary assistance until competent medical aid is available.

The purposes of first aid are: (1) to save life, (2) to prevent further injury, and (3) to preserve vitality and resistance to infection.

Everyone in the Navy must know when and how to apply first aid measures and be prepared to give competent assistance to persons injured in battle, collision, fire, and other accidents that may occur on land or at sea. A real knowledge of first aid and its purposes, when properly applied, may mean the difference between life and death, between rapid recovery and long hospitalization, between temporary disability and permanent injury.

In administering first aid, you have three primary tasks:

1. Stop severe bleeding.
2. Begin artificial respiration.
3. Prevent or reduce shock.

Work quickly, but don't rush around frantically. Don't waste time looking for readymade materials; do the best you can with whatever is at hand. Send for a medical officer as soon as possible.

GENERAL FIRST AID RULES

Although each case of injury or sickness presents its own special problems, there are some general rules that apply to practically all situations. You should have a thorough understanding of the following rules before going on to learn specific first aid treatment for various types of injuries:

1. Keep the victim lying down, his head level with his body, until you have found out what kind of injury he has and how serious it is. However, it should be quickly noted if the victim has one of the following problems that represent exceptions to this rule and require different positions (fig. 1-1):

136.1

Figure 1-1.—Positioning victim for specific injuries.

7853

Severe Shock.—If the victim is in severe shock, place him on his back with his head slightly lower than his feet.

Vomiting or Bleeding About the Mouth and Semiconscious.—If the victim is in danger of aspirating blood, vomited matter, or water, place him on his belly with his head, turned to one side, lower than his feet.

Shortness of Breath.—If the victim has a chest injury or respiratory obstruction, place him in a sitting or semisitting position.

2. Examine the victim for hemorrhage (serious bleeding), asphyxiation (suspended breathing), and shock, all of which require immediate treatment. Hemorrhage and stoppage of breathing are both of such great immediate importance that, whenever possible, one person should take care of one condition while another attends at once to the other.

If you are alone and the victim is bleeding severely and, at the same time, needs artificial respiration, the best course to follow would probably be to stop the bleeding. Artificial respiration usually requires some time to be effective and, once begun, should not be interrupted. You must decide if the bleeding is severe enough to warrant a delay in beginning artificial respiration.

3. In examining the victim, move him no more than is absolutely necessary. It may be necessary to remove some of his clothing in order to determine the extent of his injuries. Remove enough clothing to get a clear idea of the extent of the injury. It is preferable to rip the clothing along the seams, but the material may be cut if ripping it will disturb the victim greatly or aggravate an injury. Removing clothing in the usual way may do great harm, especially in fracture injuries. Do not remove so much clothing that the victim will become cold. Shoes may have to be cut off to avoid causing pain or increasing an injury.

4. Keep the victim reassured and as comfortable as possible. Often a restoration of confidence is very helpful. If pain is severe and the victim is not in deep shock and there is no respiratory or head injury, morphine may be given. (See ch. 4 for dosage.)

5. Avoid allowing the victim to see his injury. Assure him that his injuries are understood and that he will get medical attention as soon as possible.

6. Do not touch open wounds or burns with fingers or other objects, except when sterile compresses or bandages are not available and it is absolutely necessary to stop severe bleeding.

7. Do not try to give an unconscious person any solid or liquid substance by mouth. He may vomit and get some of the material into his lungs when he breathes, causing infection. It is also possible that his windpipe might be blocked causing strangulation. Death could result.

8. Do not move the victim unless it is absolutely necessary to do so. If a bone is broken, or you suspect that one is broken, do not move him until you have immobilized the injured part. This may prove lifesaving in cases of severe bone fractures, for the jagged bone may sever blood vessels, damage tissues, and increase shock. Of course, threat of fire, necessity to abandon ship, and other similar situations may require that the victim be moved. But the principle should always be kept firmly in mind and considered against other factors.

9. When transporting an injured person, always see that the litter is carried feet forward no matter what injuries he has. This will enable the rear bearer to observe the victim for any respiratory obstruction or stoppage of breathing.

10. Keep the injured person comfortably warm—warm enough to maintain normal body temperature.

In most situations you will not be called upon to do very much for an injured person. Very serious and mutilating injuries may require heroic first aid measures on your part; but by far the greater number of injuries will require a minimum of effort on your part and a maximum of judgment and self-control to prevent yourself and well-intentioned bystanders from trying to do too much.

In the following chapters, you will occasionally find information which will enable you to go somewhat beyond the usual limits of first aid treatment. This information has been included because it is recognized that situations might arise in which you and others would find yourselves isolated, temporarily surrounded by hostile forces, adrift at sea, or deprived of medical aid by the injury or death of your medical personnel; and in such situations some extra knowledge might enable you to ease a victim's suffering or help him to survive.

CHAPTER 2

HEMORRHAGE

Blood is circulated throughout the body by means of three different kinds of blood vessels: arteries, veins, and capillaries. ARTERIES are large vessels which carry the blood away from the heart; VEINS are large vessels which carry the blood back to the heart; and CAPILLARIES form a connecting network of smaller vessels between the arteries and the veins.

Hemorrhage (escape of blood) occurs whenever there is a break in the wall of one or more blood vessels. In most small cuts, only capillaries are injured. Deeper wounds result in injury to veins or arteries. Bleeding which is severe enough to endanger life seldom occurs except when arteries or veins are cut. (You may have heard of people called "bleeders," who can bleed to death from a very small cut because their blood cannot form clots. This condition is so rare, however, that you are not likely to encounter it.)

The average adult body contains about 5 quarts of blood. One pint of blood can usually be lost without harmful effect—in fact, this is the amount usually given by blood donors. However, the loss of 2 pints (1 quart) will usually cause shock, and shock becomes greater and greater as the amount of blood loss increases. If half the blood in the body is lost death almost always results.

Capillary blood is usually brick red in color. If capillaries are cut, the blood oozes out slowly. Blood from the veins is dark red. If a vein is cut, the blood escapes in a steady, even flow. If an artery near the surface is cut, the blood will gush out in spurts which are synchronized with the heart beats; but if the cut artery is deeply buried, the bleeding will appear to be a steady stream. Arterial blood is usually bright red in color.

In actual practice, you might find it difficult to decide whether bleeding was venous or arterial, but the distinction is not usually important. A person can bleed to death quickly from a cut artery; prolonged bleeding from any large cut can, of course, have the same effect. The important thing to know is that ALL bleeding must be controlled as quickly as possible.

CONTROL OF HEMORRHAGE

The only way to stop serious bleeding is by the application of pressure. In practically all cases, bleeding can be stopped if pressure is applied DIRECTLY TO THE WOUND. If direct pressure does not stop the bleeding, pressure should be applied at the appropriate PRESSURE POINT. In those very rare cases where bleeding is so severe that it cannot be controlled by either of these methods, pressure can be applied by means of a tight constricting band called a TOURNIQUET. These three ways of using pressure to control hemorrhage are described below.

Direct Pressure

In almost every case, bleeding can be stopped by the application of pressure directly on the wound. If a sterile dressing is available, place it directly over the wound and fasten it in position with a bandage. If you do not have a sterile dressing, use the cleanest cloth available—a freshly laundered handkerchief, a towel, or some article or clothing. Fold it to form a wad, place it directly over the wound, and fasten it in position with a bandage.

If the bleeding does not stop, try applying direct pressure with your hand, over the wad of cloth (fig. 2-1).

In cases of severe hemorrhage, do not worry too much about the dangers of infection. The basic problem is to stop the flow of blood. If no material is available, simply thrust your hand into the wound. Remember, DIRECT PRESSURE is the first method to use when you are trying to control hemorrhage.

7855

136.2

Figure 2-1.—Controlling bleeding by direct pressure.

Pressure Points

Bleeding from a cut artery or vein may often be controlled by applying pressure to the appropriate pressure point. A PRESSURE POINT is a place where the main artery to the injured part lies near the skin surface and over a bone. Pressure at such a point is applied with the fingers (digital pressure) or with the hand; no first aid materials are required. The object of the pressure is to compress the artery against the bone, thus shutting off the blow of blood from the heart to the wound.

There are 11 principal points on each side of the body where hand or finger pressure can be used to stop hemorrhage. These points are shown in figure 2-2. Notice that arteries are shown in red and veins are shown in blue.

If bleeding occurs on the face below the level of the eyes, pressure should be applied to the point on the lower jawbone. This is shown in figure 2-2A. To find this pressure point, start at the angle of the jaw and run your finger forward along the lower edge of the jawbone until you feel a small notch. The pressure point is in this notch.

If bleeding is in the shoulder or in the upper part of the arm, apply pressure with the fingers in back of the collarbone. You can press down against the first rib or forward against the collarbone—either kind of pressure will stop the bleeding. This pressure point is shown in figure 2-2B.

Bleeding between the middle of the upper arm and the elbow should be controlled by applying digital pressure on the inner (body) side of the arm, about halfway between the shoulder and the elbow. This compresses the artery against the bone of the arm. The application of pressure at this point is shown in figure 2-2C.

Bleeding from the hand can be controlled by pressure at the wrist, as shown in figure 2-2D. If it is possible to hold the arm up in the air, the bleeding will be relatively easy to stop.

Figure 2-2E shows how to apply digital pressure in the middle of the groin, so as to control bleeding from the thigh. The artery at this point lies over a bone and quite close to the surface, so pressure with your fingers may be sufficient to stop the bleeding.

Figure 2-2F shows the proper position for controlling bleeding from the foot. As in the case of bleeding from the hand, elevation is very helpful in controlling this bleeding.

If bleeding is in the region of the temple or the scalp, use your finger to compress the main artery to the temple against the skull bone, at the pressure point just in front of the ear. Figure 2-2G shows the proper position.

If the neck is bleeding, apply pressure below the wound, just in front of the prominent neck muscle. Press inward and slightly backward, compressing the main artery of that side of the neck against the bones of the spinal column. The application of pressure at this point is shown in figure 2-2H.

Do not apply pressure at this point unless it is absolutely essential, since there is great danger of pressing on the windpipe and thus choking the victim.

Bleeding from the lower arm (forearm) can be controlled by applying pressure at the elbow, as shown in figure 2-2I.

As mentioned before, bleeding in the upper part of the thigh can sometimes be controlled by applying digital pressure in the middle of the groin, as shown in figure 2-2E. Sometimes, however, it is more effective to use the pressure point in the upper thigh, as shown in figure 2-2J. If you use this point, apply pressure with the closed fist of one hand and use the other hand to give additional pressure. The artery at this point is deeply buried in some of the heaviest muscle of the body, so a great deal of pressure must be exerted in order to compress the artery against the bone.

Bleeding between the knee and the foot may be controlled by firm pressure at the knee. If pressure at the side of the knee does not stop the bleeding, hold the front of the knee firmly with

7856

136.3

Figure 2-2.—Pressure points for control of bleeding.

7857

one hand and thrust your fist hard against the artery behind the knee, as shown in figure 2-2K. If necessary, you can place a folded compress or bandage behind the knee, bend the leg back, and hold it in place by a firm bandage. This is a most effective way of controlling bleeding, but it is so uncomfortable for the victim that it should be used only as a last resort.

You should memorize these pressure points so that you will know immediately which point to use for controlling hemorrhage from a particular part of the body. In the discussion of these pressure points, did you notice the general principle by which you can determine the proper point to use? The correct pressure point is that which is (1) NEAREST THE WOUND, and (2) BETWEEN THE WOUND AND THE MAIN PART OF THE BODY.

It is very tiring to apply digital pressure, and it can seldom be maintained for more than 15 minutes. As soon as possible, therefore, some other method of continuing the control of bleeding must be found. Sometimes a compress, held securely over the wound by a bandage, will be enough to keep the bleeding under control; but if the bleeding is still severe you may have to apply a tourniquet.

Use of the Tourniquet

A tourniquet is a constricting band which is used to cut off the supply of blood to an injured limb. It cannot be used to control bleeding from the head, neck, or body, since its use in these positions would result in greater injury or death. A tourniquet should be used only if the control of hemorrhage by other means proves to be difficult or impossible.

Basically, a tourniquet consists of a pad, a band, and a device for tightening the band so that the blood vessels will be compressed. There are several different kinds of readymade tourniquets. The type found in Navy first aid kits consists of a length of rubber tubing or a web band 2 1/8 inches wide by 5 feet long, with a buckle for fastening.

A variety of materials can be used to improvise tourniquets. Any round, smooth pressure object may be used—a compress, a roller bandage, a stone, a rifle shell—and any long, flat material may be used as the band. It is important that the band be flat: belts, stockings, flat strips of rubber, or neckerchiefs can be used; but rope, wire, string, or very narrow pieces of cloth should not be used because they will cut into the flesh. A short stick may be used to twist the band, thus tightening the tourniquet.

A tourniquet must always be applied ABOVE the wound—that is, towards the body—and it must be applied as close to the wound as practicable.

It is best to use a pad, compress, or similar pressure object, if one is available. It goes under the band. It must be placed directly over the artery, or it will actually decrease the pressure on the artery and thus allow greater flow of blood. If a tourniquet placed over a pressure object does not stop the bleeding, there is a good chance that the pressure object is in the wrong place. If this occurs, shift the object around until the tourniquet, when tightened, will control the bleeding. If no suitable pressure object is available, use the tourniquet without it.

To apply the web tourniquet found in Navy first aid kits, wrap it once about the limb and run the free end through the slit in the felt pad and then through the buckle. Draw it tight enough to stop the flow of blood.

To apply an emergency tourniquet made from something like a neckerchief, wrap the material once around the limb and tie an overhand knot. Place a short stick on the overhand knot, and tie a square knot over it. Then twist the stick rapidly to tighten the tourniquet. The stick may be tied in place with another strip of material. Figure 2-3 shows how to apply a tourniquet.

136.4

Figure 2-3.—Applying a tourniquet.

In order to be effective, a tourniquet must be tight enough to stop the arterial blood flow to the limb. If the pressure from the tourniquet is less than the arterial pressure, arterial bleeding will continue. Also, insufficient tourniquet pressure may actually increase the amount of bleeding from the veins. So be sure to draw the tourniquet tight enough to stop the bleeding. However, do not make it any tighter than necessary.

If you have ever had any first aid training, you may have been told quite a lot about the dangers of using a tourniquet, and you may have been instructed to loosen it every 15 or 20 minutes in order to allow some blood to circulate through the injured limb. It is true that a tourniquet is dangerous, and that it can cause the loss of a limb if it is left on too long or if it is improperly applied. However, recent experience has shown that a tourniquet which is correctly applied may be allowed to remain in place for a considerable length of time, with very little risk to the limb. More important, it has been found that in any case where bleeding is severe enough to justify the application of a tourniquet, the danger to life involved in loosening the tourniquet is a much more urgent consideration than any possible risk to the limb. You must remember that a tourniquet is NEVER put on unless the hemorrhage is so severe that it cannot be controlled in any other way; by the time the tourniquet is put on, therefore, the victim has already lost a considerable amount of blood. THE ADDITIONAL LOSS RESULTING FROM LOOSENING THE TOURNIQUET MAY EASILY CAUSE DEATH. Once a tourniquet has been applied, therefore, it should be released only by medical personnel.

After you have brought the bleeding under control with the tourniquet, apply a sterile compress or dressing to the wound, and fasten it in position with a bandage.

Here are the points to remember about using a tourniquet:

- Don't use a tourniquet unless you can't control the bleeding by any other means.
- Don't use a tourniquet for bleeding from head, face, neck, or body. Use it only on the limbs.
- Always apply a tourniquet ABOVE THE WOUND, and as close to the wound as possible.
- Be sure you draw the tourniquet tight enough to stop the bleeding, but don't make it any tighter than necessary.
- Don't loosen a tourniquet after it has been applied, except in extreme emergency.
- Don't cover a tourniquet with a dressing. If it is necessary to cover the injured person in some way, MAKE SURE that all other people concerned with the case know about the tourniquet. Using crayon, skin pencil, or blood, mark a large "T" on the victim's forehead or on a medical tag attached to his wrist.

EMERGENCY SITUATIONS

Bleeding from most external wounds is fairly easy to control. When some of the larger arteries are cut, however, hemorrhage may be so rapid that death will result within a few minutes. Possible methods of controlling the flow of blood in some of these emergency situations are briefly described below.

Wounds of the neck are often caused by sharp objects such as knives, razors, and glass fragments. Sometimes the large artery is cut, sometimes the large vein, and sometimes both; in any event, the blood loss will be extremely rapid. It is sometimes possible to control the bleeding from these wounds by applying hand pressure above AND below the cut; such pressure must be maintained until a medical officer gives further instructions. It is a good idea to use cloth under your hands, if any is available, because the blood makes the neck very slippery and difficult to hold.

If the large artery in the leg is cut, the bleeding is very rapid. A tourniquet is usually necessary. At least partial (and perhaps complete) control of the hemorrhage can be and should be attained, however, by immediately applying extreme pressure directly over the wound. Cover your clenched fist with any clothing or other cloth which is available, and thrust your fist directly into the wound. (If no cloth is available, use your fist alone; but you will find it more difficult to control the bleeding in this way because your fist and the wound will both become very slippery.) Continue to apply direct pressure with your fist while the tourniquet is being applied.

Internal bleeding may be caused by deep wounds or by heavy blows which rupture internal blood vessels. The actual control of internal bleeding is beyond the scope of first aid, but the victim should always be treated for shock. (See ch. 4.)

7859

GENERAL FIRST AID MEASURES

In addition to knowing how to control serious bleeding by the application of pressure, you must know the following measures which are important in the first aid treatment of a person who has suffered severe bleeding. Any person who has lost a large amount of blood must be treated by a medical officer as soon as possible. In the meantime, however, you can greatly improve his chances for recovery by treating him for shock as soon as possible, and by keeping him quiet.

Shock is always present in persons who have lost a large amount of blood. If you don't see any symptoms of shock, treat the person for it anyway; since the measures used to prevent shock are the same as those used to treat it, you may prevent its occurrence or, at least, lessen its severity.

Keep the casualty quiet. Try to keep him from getting excited. Do not move him unnecessarily, and do not handle him roughly. Keeping him quiet will allow a clot to form in the wound, and will also help to prevent the occurrence of shock. In some cases raising the injured part may help stop the bleeding—but don't try to do this if there is any other injury, such as a fracture or a dislocation, which would be made worse by such treatment. Try in every way to be careful and gentle in handling the casualty, and do everything you can to make him as comfortable as possible under the circumstances.

SUMMARY

Hemorrhage is bleeding caused by a break in the wall of one or more blood vessels. If an artery is cut, the blood is bright red and may spurt rather than flow. If a vein is cut, the blood is dark red and flows steadily. In capillary bleeding, usually brick red in color, the blood oozes out slowly. Severe hemorrhage can cause death in a few minutes; it must be controlled as soon as possible.

Hemorrhage may be controlled in three ways—pressure directly over the wound, digital pressure at the appropriate pressure point, and pressure applied by a tourniquet. Direct pressure should be attempted first by applying a sterile compress fastened with a bandage, or by applying a wad of sterile cloth held firmly in place with your hand, directly over the wound. If bleeding cannot be controlled by direct pressure, use your fingers or hand to compress the artery against bone at the appropriate pressure point. A tourniquet should be used only if either direct pressure or digital pressure fails to control the bleeding. Mark a "T" on the injured person's forehead to indicate a tourniquet is in place. Once applied, a tourniquet should not normally be released.

A person suffering from hemorrhage should always be treated for shock. Keep him quiet, warm, and lying down, with his head lower than his feet. Always get medical assistance as soon as possible.

7860

CHAPTER 3

ASPHYXIATION

A person who has stopped breathing is not necessarily dead, but he is in immediate, critical danger. Life is dependent upon oxygen, which is breathed into the lungs and then carried by the blood to every body cell. Since body cells cannot store oxygen, and since the blood can hold only a limited amount (and that only for a short time), death will surely result from continued lack of breathing.

However, the heart may continue to beat for some time after breathing has stopped, and the blood may still be circulated to the body cells. Since the blood will, for a short time, contain a small supply of oxygen, the body cells will not die immediately. Thus, for a very few minutes, there is some chance that the person's life may be saved. A person who has stopped breathing but who is still alive is said to be in a state of ASPHYXIA.

The process by which a person can be saved after he has stopped breathing is called ARTIFICIAL RESPIRATION; it is described later in this chapter. But first let's look at some of the reasons why a person might stop breathing, and consider some of the accidents which commonly cause this condition.

CAUSES OF ASPHYXIATION

You won't always be able to tell what has caused a person to stop breathing, and it is not always necessary to know. The first aid treatment for asphyxiation is the same in all cases—that is, artificial respiration. However, since it is often necessary to deal with the causes of asphyxiation before beginning artificial respiration, determining the cause is frequently important. It is also important to know the kinds of accidents which are likely to cause asphyxiation.

Drowning, electric shock, and gas poisoning are the three most common accidents likely to result in asphyxiation. Asphyxiation also occurs from such accidents as choking, hanging, and burial in materials like grain, sand, or gravel. Excessive use of alcohol or drugs may also cause breathing to stop. Also, some illnesses, such as poliomyelitis (sometimes called polio or infantile paralysis) may result in asphyxiation.

In general, cases of asphyxiation may be classified as being due to one or more of the following causes:

- Blocked air passages
- Insufficient oxygen in the air
- Inability of the blood to carry oxygen
- Paralysis of the breathing center in the brain
- Compression of the body

Blocked Air Passages

Blocked air passages cause asphyxiation in cases of drowning, choking, and suffocation. In drowning, the air passages are blocked by water. In choking, they may be blocked by bones, large pieces of food, false teeth, chewing gum, or any other foreign object which becomes caught in the throat and cuts off the supply of air. Suffocation may occur as the result of a tight band around the neck, as in hanging or strangulation; as the result of mucous membrane swelling, from such causes as breathing live steam or certain chemical warfare gases; or because of a spasm of the air passages caused by smoke, ammonia, some chemical warfare gases, acid fumes, or similar agents.

Insufficient Oxygen in the Air

Even if the air passages are not blocked, asphyxia may occur because of insufficient oxygen in the air. For example, aviators and mountain climbers are sometimes asphyxiated because there is not enough oxygen in the air at

7861

high altitudes. The supply of oxygen in unventilated spaces aboard ship, such as voids, tanks, and double bottoms, is frequently too small to support life. Similarly, on shore, places which are not well ventilated—cisterns, sewers, old wells, unused basements, silos, abandoned mines—may be dangerously deficient in oxygen. (Another danger of such places is that they may contain poisonous or explosive gases. Before anyone is allowed to go down to work in places of this kind, the air must be tested to be sure that it is safe.) Another cause of poor oxygen supply may be that other gases take the place of the oxygen. For example, a fire in any closed space results in the formation of carbon dioxide and a consequent reduction in the amount of oxygen. (The amount of carbon dioxide is greatly increased, of course, if you use a carbon dioxide extinguisher to put out the fire.) If there is not enough oxygen available, unconsciousness will occur suddenly and breathing will stop.

Inability of the Blood to Carry Oxygen

Carbon monoxide poisoning is the primary example of asphyxiation due to an inability of the blood to carry oxygen. Carbon monoxide combines with certain blood cells very rapidly, in such a way as to prevent the blood from carrying oxygen. Thus the body cells (especially in the brain) suffer a lack of oxygen which causes death. Carbon monoxide is a colorless, odorless, and tasteless gas which gives no warning of its presence. Even a small amount of it can be very dangerous. Carbon monoxide is present in engine exhaust gases, manufactured gases used for cooking and heating, sewer gases, gases used for or resulting from industrial processes, and many other gases. It is produced by any fire, but particularly those in which coal, coke, oil, or gasoline are burned. It is also produced by decomposition; for example, food decaying in the hold of a ship may produce enough carbon monoxide to poison anyone who goes into the space. Carbon monoxide poisoning is a frequent cause of asphyxia.

Paralysis of the Breathing Center of the Brain

Breathing can also be stopped by paralysis of the breathing center in the brain. The most frequent causes of paralysis of the breathing center are electric shock; excessive amounts of alcohol, drugs, or anesthetics; and breathing too much carbon dioxide. Also, some frequently used solvents, such as carbon tetrachloride, affect the breathing center and cause breathing to stop.

Compression of the Body

Since breathing movements cannot be made against any great amount of pressure, compression of the body can easily stop a person's breathing. Accidental burial in dirt, sand, gravel, coal, cinders, or similar material is likely to cause asphyxiation because of body compression. In such cases death may occur even though the nose and mouth are uncovered.

In many cases of asphyxiation, it is necessary to rescue the victim before you can begin first aid treatment. Rescue procedures for some common emergencies are described in chapter 10. If you find it necessary to rescue a person from any dangerous situation, remember that the danger may still exist. Take all possible measures to protect yourself. Speed is important, but a careful evaluation of the situation is essential. A few moments' thought may make the difference between life and death—for you, as well as for the person you are trying to rescue.

ARTIFICAL RESPIRATION

The purpose of artificial respiration is to force air out of the lungs and into the lungs, in rhythmic alternation, until natural breathing is reestablished. Artificial respiration should be given only when natural breathing has been suspended; it must NOT be given to any person who is breathing naturally, on his own. Do not assume that a person's breathing has stopped merely because he is unconscious, or because he has been rescued from the water, from poisonous gas, or from contact with an electric wire. Remember: DO NOT GIVE ARTIFICIAL RESPIRATION TO A PERSON WHO IS BREATHING NATURALLY.

If you do not know whether a person is breathing, place your hands on his sides at the level of the lowest ribs. If he is breathing, you will usually be able to feel the movement.

If possible, send someone for a medical officer; but don't go yourself if you are alone with the victim. Speed in beginning artificial respiration is essential in any case in which breathing has stopped. Every moment's delay cuts down the victim's chance of survival. Do not take time to move the victim to a more satisfactory place, unless he is in such a dangerous

1987 7862

position that he must be moved in order to save his life. If special circumstances make it necessary to move the victim before he has begun to breathe normally by himself, continue the artificial respiration while he is being moved.

If another person is present while artificial respiration is being given, he can be very helpful. Have him remove false teeth, chewing gum, seaweed, froth, mucus, mud, or other matter from the victim's mouth; at the same time he can bring the victim's tongue forward. He can also loosen the clothing around the victim's neck, waist and chest. If you are alone you will have to attend to these things before beginning artificial respiration.

- Do not attempt to remove water from the victim's lungs or stomach.
- Keep the victim sufficiently covered so that he will not suffer from exposure.
- Do not allow bystanders to crowd around the victim and interfere with the first aid treatment.
- Do not attempt to give the victim anything to drink while he is unconscious, or you may cause him to choke.
- Artificial respiration must be continued for at least 4 hours unless the natural breathing is restored before that time or a medical officer declares the person dead. Some people have been saved after as much as 8 hours of artificial respiration.
- Do not give up in less than 4 hours, even if the victim appears to be dead. All persons who have suffered an interruption of breathing do not have the same appearance. In some cases, the face is bluish black. In other cases it is pale and white. In cases of carbon monoxide poisoning the skin is often (although not always) a peculiar cherry red in color. In many cases of suspended breathing the pulse is so weak that it cannot be detected. Sometimes after electric shock the entire body becomes stiff and rigid—a condition which is occasionally mistaken for the rigidity of death. You can see, therefore, how difficult it is to judge whether a person in this condition is dead or alive, and the usual indications of death cannot be trusted in cases of asphyxiation.

METHODS OF ARTIFICIAL RESPIRATION

The standard methods of artificial respiration are the mouth-to-mouth method (with variations) and several manual methods (back-pressure, arm-lift; chest-pressure, arm-lift; back-pressure, hip-lift). Of these the mouth-to-mouth method is the one that is considered best. Although first advocated for infants and children, it is now the recognized method of choice for all age groups and body weights.

Mouth-to-Mouth Method (Mouth-to-Nose)

When administering mouth-to-mouth artificial respiration, use the following procedures:

1. Place the victim on his back immediately. Don't waste time moving to a better place, loosening clothing, or draining water from lungs.
2. Quickly clear his mouth and throat. Remove any dentures, mucus, food, and other obstructions.
3. Tilt the victim's head as far back as possible (fig. 3-1A). His head should be in a "chin-up" position and his neck stretched to ensure an open airway (fig. 3-1B).
4. Lift his lower jaw forward. Grasp the jaw by placing your thumb into the corner of his mouth (fig. 3-1C). Do not hold or depress his tongue.
5. Pinch his nose shut (or seal his mouth). Prevent any air leakage.
6. Open your mouth wide and blow. Take a deep breath and blow forcefully (except for babies) into his mouth or nose until you see his chest rise (fig. 3-1D).
7. Quickly remove your mouth when his chest rises. Listen for exhalation—if the victim makes snoring or gurgling sounds, his jaw is not high enough (fig. 3-1E).
8. Repeat (steps 6 and 7) 15 to 20 times per minute. Continue until the victim begins to breathe normally.
9. Remove air blown into the victim's stomach. Periodically, between breaths, if the stomach is distended, place your hand on his upper abdomen and gently but firmly press the air out of his stomach (fig. 3-1F).
10. For infants seal both mouth and nose with your mouth. Blow with small puffs of air from your cheeks.

Avoiding Mouth-to-Mouth Contact.—The mouth-to-mouth method may be objectionable to many as there is a hesitancy on the part of a

7863

4.224

Figure 3-1.—Mouth-mouth artificial respiration.

7864

rescuer to touch with his mouth the mouth of a person near death. Several solutions have been offered. The first one is to cover the victim's mouth with gauze or any clean, porous cloth before blowing into his mouth. (See fig. 3-2A). This will prevent the lip-to-lip contact that may be so repulsive.

Another means of avoiding lip-to-lip contact is to form a ring with the index finger and thumb of your hand holding the victim's chin. The victim's lips are then opened and the ring placed firmly about his mouth, thus holding his mouth open. The third and fourth fingers are placed under the victim's chin to maintain upward traction and the thumb seals off his nostrils (figs. 3-2B and C).

A device known as an oropharnygeal airway (figs. 3-2D and E) also eliminates lip-to-lip contact. Unfortunately, as with most first aid devices, an airway is often not at hand when needed. If this is the case, do not waste time looking for one, but proceed immediately to administer mouth-to-mouth artificial respiration. Hesitation may mean the difference between life and death.

Mouth-to-Airway Artificial Respiration

The oropharyngeal airway eliminates the physical-contact element from mouth-to-mouth artificial respiration. An S-shaped instrument, it has an airway at either end, one larger than the other. One half (the short half) serves as a mouthpiece for the rescuer; the other half is inserted into the victim's mouth.

In inserting the airway, you must be careful not to push the tongue back but to hold it forward. (In inserting the airway in small children and infants, the SHORT end of the airway should be inserted, and you should blow through the long or larger end of the S-tube.) When in position, the airtube delivers air blown from your lungs directly into the pharynx, trachea, and lungs of the victim.

After the airway has been properly placed, you should assume a position at the top of the victim's head, firmly grasp his lower jaw with both hands and pull forcefully upward. This position must be maintained throughout the procedure to maintain an open airway. Prevent leakage of air by blocking the victim's nose with your thumbs. (See fig. 3-2F for proper positioning of thumbs.)

Inflate the victim's lungs by blowing into the mouthpiece—FORCEFULLY WITH ADULTS, GENTLY WITH CHILDREN, ONLY "PUFFS" WITH INFANTS. You must watch the victim's chest constantly. When his chest rises, remove your mouth from the mouthpiece and let the victim exhale by the natural elastic recoil of his lungs and chest wall. Repeat this procedure 15 to 20 times per minute.

CAUTION: With the airway in place, the victim may gag and vomit when starting to respond to your efforts to revive him. At the first sign of revival, remove the airway.

Manual Methods of Artificial Respiration

Under certain circumstances, mouth-to-mouth resuscitation cannot be used. The gas mask worn in contaminated areas and facial injuries involving bleeding around the mouth and lips would prevent its being used. Under such conditions, the rescuer must use a manual method of artificial respiration. All too frequently, however, manual methods are not effective because of failure on the part of the rescuer to MAINTAIN A FREE AND UNOBSTRUCTED AIRWAY. (Even with the oropharyngeal airway in place, exchange of air is accomplished freely only if the head is properly positioned.) In using the manual methods discussed below, the first consideration must be proper positioning of the head to avoid airway obstruction.

Back-pressure, Arm-Lift Method.—Before the revival of mouth-to-mouth resuscitation, the back-pressure, arm-lift method was accepted on a nationwide basis as the method of choice. However, this method fails in an overwhelming majority of cases because the head drops as the arms are raised, and this action shuts off the airway. But, if an assistant is available to hold the victim's head up and thus maintain an open airway, the back-pressure, arm-lift method is effective and is the method of choice in those instances where drainage of fluids such as vomited matter is troublesome, or if facial bleeding or injury prevents the use of the mouth-to-mouth method.

The assistant should sit at one side of the victim's body facing toward his head, place his hand on the victim's forehead and, using the bony ridge of the brow to get a firm grasp, tilt the head backward. With his other arm, he supports his own body. The rescuer kneels at the victim's head on one or both knees, and faces toward his feet. (For proper positioning, see fig. 3-3.)

7865

5.145

Figure 3-2.—Methods of avoiding mouth-to-mouth contact; inserting the oropharyngeal airway.

7866

Figure 3-3.—Back-pressure, arm-lift method.

4.225

7867

The step-by-step procedure follows:

1. Place your hands on the victim's back in such a way that the heels of your hands lie just below a line running between the victim's armpits. With the tips of your thumbs touching, spread your fingers (fig. 3-3A).

2. Rock forward until your arms are approximately vertical and allow the weight of the upper part of your body to exert a slow, steady, even pressure downward on your hands. This forces the air out of the victim's lungs. Your elbows should be kept straight and pressure exerted almost directly downward on his back (fig. 3-3B).

3. Release the pressure, avoiding a final thrust downward, and begin to rock backward slowly.

4. As you rock backward, grasp the victim's arms just above his elbows and draw his arms upward and backward. Apply just enough lift to feel resistance and tension at the victim's shoulders. Do not bend your elbows, and with the backward rock the victim's arms will be drawn backward (fig. 3-3C and D). Then drop the victim's arms gently to the ground. This completes the full cycle.

5. Repeat steps 1 through 4 approximately 20 times per minute. As soon as the victim is breathing, adjust your timing to assist him. Do not fight his attempts to breathe.

Chest-pressure, Arm-Lift Method.—As in other methods of artificial respiration, the key to success in using the chest-pressure, arm-lift method is an open airway. Place the victim on his back. A blanket, pillow, folded coat or the like should be used to elevate his shoulders. This positioning lets the head drop back and extends the neck ensuring an open airway (fig. 3-4B). If none of these materials is available, you may place one foot under the victim's shoulder and thus elevate his shoulders. Then by tilting his head backward and pressing firmly with a knee against the top of his head, you can maintain his head in this position (fig. 3-4A).

The step-by-step procedure follows:

1. Grasp the victim's forearms above the wrists.

2. Place the victim's hands on his chest and rock forward. Exert only moderate pressure almost vertically downward until you feel firm resistance. This forces air out of his lungs.

3. Then rock backward, drawing the victim's arms upward and backward. This draws air into his lungs.

4. Repeat steps 2 and 3 approximately 20 times per minute.

Back-pressure, Hip-Lift Method.—The back-pressure, hip-lift method (fig. 3-5) may be used in cases where it is necessary to give artificial respiration to a person who has been injured in the upper part of his body—chest, shoulders, arms.

The victim should be placed face-down, with his elbows bent. Turn his face to one side and extend his neck to ensure an open airway.

The step-by-step procedure follows:

1. Kneel on either knee, straddling the victim at the level of his hips. The heel of your other foot should be directly opposite the kneeling knee.

2. Rock forward and place your hands on the middle of the victim's back, just below his shoulder blades (fig. 3-5A). Your fingers should be spread downward and outward, with your thumb tips touching at the spine. Allow the weight of the upper part of your body to exert a slow, steady, even pressure almost vertically downward until firm resistance is met (fig. 3-5B).

3. Rock backward and let your hands come to rest at the victim's hips. Slip your fingers under his hipbones (fig. 3-5C).

4. Keeping your arms straight, lift the victim's hips about 6 inches off the ground, then gently lower him to the ground (fig. 3-5D).

5. Repeat steps 2, 3, and 4 approximately 20 times per minute.

The back-pressure, hip-lift method is often difficult to perform for long periods, especially if the victim is large or heavy. It does have one advantage, however, in that each time the hips are raised, the body is pulled away from the head and this tends to keep the neck extended and the airway open.

Pole-Top Resuscitation

The work of construction linemen is hazardous, particularly in that they often work with or near "live" wires and may be shocked accidentally. When a man working on a pole receives an electric shock, he will usually need two first aid measures—artificial respiration and external cardiac massage, the first to restore his breathing, the second to restore his heartbeat. (Do not give external cardiac massage unless you have been trained in its use.) Under ideal conditions, a man can be lowered to the

7868

4.225

Figure 3-4.—Chest-pressure, arm-lift method.

7869

Figure 3-5.—Back-pressure, hip-lift method.

7870

ground in less than 2 minutes. If he can be lowered after the initial shock within 2 minutes, he should be and mouth-to-mouth respiration and external cardiac massage (if necessary) should be begun immediately. Give the victim 3 to 5 respirations, then examine him quickly for a pulse. The best place to determine pulse is at the neck. Place the tips of your index and middle finger alongside the Adam's apple and press slightly against the neck in this area. Here you can feel the carotid artery. If a pulse exists, do not give external cardiac massage. Continue with artificial respiration until the victim is breathing normally.

Under field conditions, it may take 10 minutes or longer to lower the victim from the pole. Since a person cannot live more than a few minutes without oxygen and blood circulation, every moment lost decreases the victim's chances of survival. Resuscitation measures must, therefore, begin on the pole. Various procedures have been tried to cut down the interval between the time of electric shock and the time resuscitation begins. The method which has thus far proved most effective is known as "pole-top" resuscitation. Properly applied, pole-top resuscitation provides an adequate exchange of air to maintain life and additionally, with each cycle, the heart is compressed sufficiently to pump blood to the brain and other vital organs.

Pole-top resuscitation is performed as follows:

Climb to the victim and immediately disengage him from the power circuit. (CAUTION: Do not attempt to release the victim from energized lines or equipment unless you know how to do it and have the proper equipment.) Allow him to hang alongside the pole by his own safety belt. Take a position on the pole BELOW the victim, and work your way up the pole. Keep the victim between yourself and the pole, and keep the victim's legs spread apart so that he is straddling your safety belt. When you have worked your way up as high as you can, the weight of his body will be on your safety belt. The correct position is shown in figure 3-6. (Do not take the time to check for pulse. You may be wearing gloves and, at any rate, determining pulse at the top of a pole is difficult at best and has no bearing on the first aid measures to be given.)

Pull the victim's tongue forward, and clear his mouth of any foreign objects (false teeth, chewing gum). Lay his head back over your shoulder and keep it there during resuscitation. This will ensure an open airway.

4.227
Figure 3-6.—Pole-top resuscitation.

Put your arms around the victim's waist (under his arms) and place your hands on his abdomen. Your fingertips should just touch in the middle of his abdomen, and your thumbs should be just below his lower ribs.

Use your arms and hands to compress the victim's abdomen and push it upward. By the end of the compression stroke, your hands will be cupped and your fingers will be depressing the victim's abdomen immediately under his ribs. Release the pressure quickly to complete the cycle. Repeat the cycle 30 to 40 times per minute.

Resuscitation should continue until the victim is revived or until he can be lowered to the ground. Do not interrupt resuscitation to attach a rigging to the victim; the rigging should be of a type that permits artificial respiration to continue while it is being attached to the victim. Once the rigging is attached, lower the victim to the ground and immediately begin MOUTH-TO-MOUTH resuscitation and, if necessary, perform external cardiac massage simultaneously.

MECHANICAL AIDS

Mechanical RESUSCITATORS are sometimes used as aids in restoring breathing. Because they

7871

are applied only to the victim's face, they are particularly useful in situations where physical manipulation of the body would be difficult or impossible—while a person is undergoing surgery, while he is trapped under debris or caught under an overturned vehicle, or while he is being transported to a place of safety. A resuscitator may often be used successfully on persons who have extensive burns, broken bones, or other serious injuries which make it impossible to use the manual methods of artificial respiration.

However, a resuscitator should never be used by anyone who is not entirely familiar with the correct method of operation. There are different kinds of resuscitators, so knowing how to operate one will not necessarily enable you to operate another type. Each mechanical resuscitator has a manufacturer's instruction book which gives specific operating directions, but you must have actual training and practice before using any resuscitator. Most of the older types involve the application of pressure, and are therefore very dangerous when used by unskilled persons.

The type of resuscitator which is now being distributed by the Navy is so designed that you cannot apply too much pressure. This type of resuscitator is much safer to operate, since only the amount of oxygen which the victim can use is allowed to pass through the respirator.

An INHALATOR is a device which supplies oxygen, or a mixture of oxygen and carbon dioxide, while artificial respiration is being performed by one of the manual methods previously described. Since the inhalator does not involve pressure, it is less dangerous to use than the mechanical resuscitator. Most mechanical resuscitators can be set up to operate as simple inhalators.

These mechanical aids may be very helpful in some situations, but they cannot be expected to take the place of the other methods of artificial respiration. For one thing, the mechanical devices are not always available at the scene of an accident; and, for another, they are worse than useless in the hands of untrained persons. You should know that devices of this type are available, and that they may sometimes be used to great advantage; but you must also recognize their limitations and dangers.

Treatment During Recovery

When a person is regaining his breath, the bluish or pale appearance of his skin may be succeeded by a distinct flush of color. Then his muscles may begin to twitch and his fingers to scratch and clutch. Swallowing movements are sometimes the first sign of natural respiration. Or the first attempt to breathe may be a faint catch of breath or a sigh. You must not fight the victim's efforts to breathe. If you are using the mouth-to-airway method, remove the airway when he begins to breathe; if you are using mouth-to-mouth (nose) or a manual method, adjust your efforts to assist him.

When the victim's breathing has become fairly regular, sit down near his head where you can watch him, in such a position that you can immediately begin artificial respiration again if his natural breathing fails. Do not move the victim immediately; let him rest for at least a few minutes. When you do move him, use a stretcher or something similar so that he can stay in a horizontal position. DO NOT LET HIM SIT OR STAND OR WALK. The slightest exertion at this point might easily cause death from heart failure. Sometimes people who have suffered an interruption of natural breathing go through a period of frenzied violence soon after they are revived. If this occurs, you must be prepared to keep the victim quiet in spite of his own efforts to the contrary.

A person whose breathing has been interrupted must always be treated for shock. (See ch. 4.) Keep him covered so that he can maintain body temperature, but do not overheat him. Keep him quiet, and get him under the care of a medical officer as soon as possible. NEVER give morphine to a person who has suffered an interruption of breathing.

SUMMARY

Asphyxiation is a condition in which there is a deficiency of oxygen and increased carbon dioxide in the blood and tissues. Some common causes of asphyxiation are drowning, electric shock, inhalation of poisonous gases, and lack of sufficient oxygen in the atmosphere.

Since asphyxiation can be fatal in a very short time, emergency treatment must begin as soon as possible. First aid for asphyxiation consists primarily of administering artificial respiration. Shock, nearly always a factor, must also be treated, along with other injuries. In some cases of asphyxiation, the heart may stop

7872

beating. External cardiac massage may be given to restore heartbeat, if you have been trained to use the technique.

In giving artificial respiration, the most important consideration is to maintain an open airway. The mouth and throat must be cleared of all obstructions, and the tongue brought forward. Extend the neck and position the head as recommended for the method of artificial respiration used.

Mouth-to-mouth artificial respiration is the preferred method as it is the most effective in introducing large volumes of air into the lungs. If it is not possible to give mouth-to-mouth respiration, use a manual method, paying particular attention to ensure an open airway.

7873

CHAPTER 4

SHOCK

Have you ever hit the end of your finger with a hammer, dropped a heavy weight on your foot, or caught your hand in a car door? Along with the immediate pain, did you experience a feeling of weakness, dizziness, and nausea? If so, this was SHOCK—a mild form of it.

Some degree of shock follows all injuries. It may be slight and almost unnoticed, lasting only a moment, or it may be severe enough to cause death. Shock is often the cause of death in cases of burns, hemorrhage, poisoning, fractures, and other serious injuries. It may occur immediately following the injury, or it may come on several hours later. Even if it does not occur immediately, it is a real danger. All injured persons should be treated for shock before being treated for the actual injuries, except in cases where there is severe hemorrhage or asphyxiation.

In order to be able to help an injured person, therefore, you must know what to do for shock. Instead of just trying to memorize the treatment, however, let's try to understand something about the nature of shock, what causes it, how you can recognize it, and how you can prevent it. The more you learn about shock, the more you will understand why certain measures are important in the first aid treatment of this condition.

WHAT IS SHOCK?

When you hit the end of your finger with a hammer, you get a response from your whole body. Since your finger hurts, you might think that it is the only part of you which is responding to the injury; but actually a great many changes are taking place in your body while you are concerned with the immediate pain. Your body AS A WHOLE is injured, and your body AS A WHOLE attempts to recover from the injury. A series of changes takes place, designed to restore the body to its [illegible] healthy condition.

Sometimes , however, the changes which occur may in themselves cause further damage to the body. To some extent this is what happens in shock. When a person is injured, the blood flow in his entire body is disturbed. To overcome this difficulty, the heart beats faster and the blood vessels near the skin and in the arms and legs contract, thus sending most of the available blood supply to the vital organs of the body and to the nerve centers in the brain which control all vital functions.

While this is going on, the other body cells do not receive enough blood, and therefore do not get enough oxygen or food. The blood vessels, like the rest of the body, suffer from this lack, and eventually they lose their ability to contract. When this happens, the vital organs and the brain do not receive enough blood, either, and the condition of shock becomes worse and worse. If this situation continues, the damage presently becomes so extensive that recovery is impossible. In less severe cases, prompt first aid treatment for shock may make the difference between life and death. In mild cases of shock, recovery usually occurs naturally and rather quickly.

Basically, then, shock is a condition in which the circulation of the blood is seriously disturbed. As we will see later, the measures used to combat shock are aimed at helping the body to recover from this disturbance of the blood flow.

CAUSES OF SHOCK

Serious shock occurs as a result of serious injury to any part of the body. Crush injuries, fractures, burns, poisoning, and prolonged bleeding are very likely to cause serious shock. An interruption of breathing, from whatever cause, is almost always followed by severe shock. Blast and concussion injuries, caused by pressure waves resulting from the

7874

Remember, EVERY SERIOUSLY INJURED PERSON IS LIKELY TO DEVELOP SERIOUS SHOCK.

PREVENTION AND TREATMENT OF SHOCK

In many emergency situations, the most helpful thing you can do for an injured person is to begin treatment for shock. If shock has not yet developed, the treatment may actually prevent its occurrence: if it has developed, you may be able to keep it from reaching a critical point. As we have seen, shock creates a vicious circle—the worse it is, the worse it gets. It is extremely important, therefore, that you begin the treatment at the first possible moment.

In order to give first aid treatment to a person in shock, you will need to know how warm he should be kept, what position is best for him, and what you may do to relieve pain.

A word of caution must be given here concerning the administration of liquids to a sick or injured person. Until recently, first aid books and training courses have emphasized the use of warm liquids (in particular, water, tea, and coffee) as a part of the first aid treatment for shock. However, it is now believed that the administration of liquids is not, as a rule, a necessary or even desirable part of first aid treatment. It is true that a person in shock is in need of liquid; but liquid given by mouth is not absorbed—and therefore does no good—except in very mild cases of shock. In moderate or deep shock, intravenous administration of liquids is necessary; but this is a medical procedure, and cannot under any circumstances be performed by a person giving first aid.

A further and even more important reason why you should not give liquids by mouth to an injured person is that this treatment is very likely to interfere with later administration of an anesthetic, should this be necessary.

As we have seen, a person in shock is often thirsty. No particular harm will be done if you allow the victim to moisten his mouth and lips with cool water, if it will make him more comfortable; but in general there is no need to give him anything to drink unless you are in a position where medical personnel will not be available for an excessively long period of time. In giving first aid treatment to a sick or injured person, you must of course use your own common sense and good judgment. It would not be reasonable, for example, to deprive a person of fluids for several days merely because he had been injured. The body needs 2 to 3 quarts of liquid daily. If an injured person is able to survive for some time in spite of his wounds, he should not be deprived of the normal amount of liquid which the body requires. If medical care will not be available for some time, you should give SMALL AMOUNTS of warm water, warm tea, or warm coffee, if he is conscious and able to swallow and if he has not suffered internal injuries.

As a general rule, then, liquids should NOT be given as a part of first aid treatment, but they may be given if circumstances make it necessary for you to go somewhat beyond the usual first aid measures in caring for an injured person.

In the case of burns, an exception must be made to the rule of not giving liquids. A seriously burned person has an overwhelming need for fluids. It is therefore a permissible and even desirable part of first aid treatment for burns to give water or other liquids. Sweet tea, fruit juices, or sugar water may be given, if the casualty is conscious and able to swallow, if he has no internal injuries, and if vomiting is no problem.

One final precaution must be given concerning the use of liquids: NEVER GIVE ALCOHOL TO A PERSON IN SHOCK OR WHO MAY GO INTO SHOCK. Alcohol increases the blood supply to surface vessels and so diminishes the blood supply to the brain and other vital organs.

Heat

Heat is important in the treatment of shock to the extent that the injured person's body heat must be conserved. Exposure to cold, with resulting loss of body heat, can cause shock to develop or to become worse. You will have to judge the amount of covering to use by considering the weather and the general circumstances of the accident. Often a light covering will be enough to keep the casualty comfortable. Wet clothing should be removed and dry covering provided, even on a hot day. Use blankets or any dry material to conserve body heat. Artificial means of warming (hot water bottles, heated bricks, heated sand) should not ordinarily be used. Artificial heat may cause loss of body fluids (by sweating) and it brings the blood closer to the surface, thus defeating the body's own efforts to supply blood to the vital organs and to the brain. Also, the warming agent may burn the victim.

KEEP AN INJURED PERSON WARM ENOUGH FOR COMFORT, BUT DO NOT OVERHEAT HIM.

Position

The best position to use for the prevention or treatment of shock is one which encourages the flow of blood to the brain. If it is possible to place the injured person on his back on a bed, cot, or stretcher, you can raise the lower end of the support about 12 inches so that his feet will be higher than his head (fig. 4-2). If the circumstances of the accident make it impossible to do this, it might still be possible for you to raise his feet and legs enough to help the blood flow to the brain. Sometimes it is possible to take advantage of a natural slope of ground and place the casualty so that his head is lower than his feet.

136.6

Figure 4-2.—Position for treatment of shock.

In every case, of course, you will have to consider what type of injury is present before you can decide on the best position. For example, a person with a chest wound may have so much trouble breathing that you will have to raise his head slightly. If the face is flushed rather than pale, or if you have any reason to suspect a head injury, do not raise the feet; instead, you should keep the head level with, or slightly higher than, the feet. If the person has broken bones, you will have to judge what position would be best both for the fractures and for shock. So remember: THE BASIC POSITION FOR TREATING SHOCK IS ONE IN WHICH THE HEAD IS LOWER THAN THE FEET. Do the best you can, under the particular circumstances, to get the injured person into this position. In any case, never let a seriously injured person sit or stand or walk around.

Relief of Pain

A long accepted, but false generalization is that all extensive injuries are associated with severe pain and that the more extensive the injury, the worse the pain. In reality, severe and even fatal injuries may be considerably less painful than a mashed finger tip, which can cause agony.

Another generalization is that, with similar injuries, everyone experiences the same amount of pain. This, too, is incorrect. Some feel pain far more severely than others. Also, those who would not be in much pain from a wound when rested, relaxed, and confident might experience severe pain from the same wound if exhausted, tense, and fearful. Persons in shock tend to feel less pain. However, pain, unless relieved, may cause or increase shock.

Relief of pain can often be accomplished without the use of drugs. The injured man should be assured and made to realize that his injuries are understood and that he will get the best possible care. He should also be told of plans to get medical help or plans to move him to a place where medical assistance is available.

Support for an Injury.—Pain can often be relieved by furnishing adequate support for an injury. Fractures of bones in which the surrounding tissue swells rapidly are extremely painful when left unsupported. Adequate immobilization of fractures not only relieves pain but prevents further tissue damage and shock. Needless suffering can often be eliminated by unlacing or slitting a shoe or loosening tight clothing in the region of the injury. Often a simple adjustment of a bandage or splint will be of much benefit, especially when accompanied by a few encouraging words.

Use of Drugs.—Ordinarily, drugs are NOT to be administered by persons giving first aid treatment. Which drug to give and the dosage must depend on a number of conditions. Decisions such as these can be made only by medical personnel.

You may give one or two aspirin or APC (aspirin-phenacetin-caffeine) tablets for mild pain. Other drugs should be given only by medical personnel.

Morphine Administration.—In time of battle, shipboard disaster, or other extreme emergency, morphine syrettes are sometimes distributed to nonmedical personnel. Therefore, you must know when to use morphine and when not to use it, and how to use the morphine syrette.

7877

Morphine is the most effective of pain-relieving drugs. Properly administered, it will relieve severe pain and assist in the prevention of shock. The adult dose of morphine is 8 to 16 milligrams (1/8 to 1/4 grain) repeated not more than ONCE, if necessary, in not less than 4 hours. A morphine syrette may be given if the pain is very severe and IF THERE IS:

1. No head injury.
2. No chest injury, this to include non-sucking as well as sucking wounds.
3. No wound of the throat, nasal passages, mouth, or jaws from which blood might obstruct the airway.
4. No massive bleeding.
5. No respiratory obstruction or impairment, including chemical burns of airway. Any casualty breathing at a rate of less than 16 breaths per minute should not be given morphine.
6. No evidence of severe or deepening shock.
7. No loss of consciousness.

The morphine syrette (fig. 4-3) consists of a collapsible metal tube with a sterilized hypodermic needle attached. Syrettes now being supplied contain 16 milligrams (1/4 grain) of morphine. (Syrettes containing 1/2 grain of morphine may still be in use. If you have a syrette containing 1/2 grain, use no more than one-half of its contents and THROW THE REST AWAY.)

If it is necessary for you to give morphine to an injured person, use the following procedure:

1. Find a place where the morphine can be injected. The best place to inject morphine is usually on the outer surface of the upper arm, but it may be injected into the thigh if the arms are injured. In very cold climates, morphine is sometimes injected at the back of the neck in order to avoid undressing the victim any more than necessary.

CAUTION: If a tourniquet has been applied, the morphine must be injected ABOVE THE TOURNIQUET—that is, between the wound and the main part of the body.

2. Sterilize the skin, if time and facilities permit. You can do this by washing the skin with alcohol or any skin antiseptic. If no antiseptic is available, wash the area with soap and water or with plain tap water alone.
3. Remove the transparent plastic hood which is over the needle.
4. Grasp the wire loop and push the wire down into the tube, until the loop is stopped by the guard. When the wire is pushed into the tube, it pierces the inner seal.

136.7

Figure 4-3.—Morphine syrette.

5. Pull out the wire and throw it away. DO NOT TOUCH THE NEEDLE!
6. Thrust the needle through the skin. Push it in the full length of the needle.
7. When the needle is properly in place, inject the morphine solution by slowly squeezing the collapsible metal tube, beginning at the sealed end and working toward the needle. If the casualty is in shock or has severe burns, massage the injection site for a few minutes to help circulate the morphine.

Overdosage is an ever-present danger. For this reason every casualty who has received

7878

morphine should have it plainly noted. Write the letter "M" and the hour of injection on his forehead (e.g., M 0830). Use a skin pencil, colored antiseptic, ballpoint pen, crayon, or ink for this purpose. The empty syrette may be attached to his shirt collar or some other conspicuous area of clothing by a safety pin or other means to alert others that morphine has been given.

DO NOT GIVE REPEATED INJECTIONS OF MORPHINE. In general, do not give more than two injections, not less than 4 hours apart. Morphine is a dangerous drug; it must be used only with the greatest caution.

SUMMARY

Shock is a disturbance of the circulation of the blood and is caused by injury. Some degree of shock accompanies or follows all injuries. Severe shock usually occurs in cases of asphyxiation, hemorrhage, burns, large wounds, fractures, and other similar injuries.

Shock is characterized by the following symptoms: shallow, rapid, irregular breathing; weak, rapid pulse; cold, clammy skin; profuse sweating; usually a pale skin, but in some cases bluish, in others, slightly flushed; and pupils dialated or enlarged. The injured person may complain of thirst, weakness, faintness, and dizziness. He also may exhibit a lack of awareness and responsiveness. Unconsciousness may result in cases of severe shock.

In treating shock, act quickly. Keep the injured person warm, lying on his back, and lessen his pain. The basic position (head slightly lower than his feet) is altered for the following injuries: if he has a head injury or his face is flushed, raise his head slightly; if he has a chest injury or breathing difficulty, raise his head and shoulders; if he has facial injuries and is semiconscious, place him on his belly with his head, turned to one side, lower than his feet. Do not force an injured person into the position recommended if this would cause further injury or increase pain. Never let an injured person sit, stand, or walk,

As pain can produce shock or increase its severity, do all you can to relieve it. Providing adequate support for all injuries and loosening tight clothing will often relieve pain. Normally, drugs should not be given as a first aid measure. However, under certain conditions, morphine may be given if pain is severe and if there is no head injury, no chest injury or breathing difficulty, no massive bleeding, no evidence of severe or deepening shock, and no loss of consciousness. The adult dose is not more than 1/4 grain, repeated not more than once, in not less than 4 hours. Always indicate that morphine was given by writing the letter "M" and the time on the injured person's forehead. Attach the empty syrette to some conspicuous area of clothing.

7879

CHAPTER 5

POISONING

As we have seen, severe hemorrhage, asphyxiation and shock must be given first aid treatment immediately, if life is to be saved. In cases of poisoning, speed in giving aid is also essential—the sooner the poisonous substance can be removed or neutralized, the better will be the victim's chances for recovery.

CAUSES OF POISONING

Poisoning occurs in a variety of ways. Sometimes it is the result of attempted suicide or homicide. Frequently it is accidental—a person takes an overdose of medicine, or by mistake takes some poisonous substance such as lye, iodine, or arsenic. Poisoning may be caused by the continuous use of a substance which is not dangerous if taken for a short time, but which is cumulative in effect—that is, the poison is not eliminated from the body as quickly as it is absorbed. Poisoning occurs also from overexposure to industrial materials such as ammonia, gasoline (and, in fact, all petroleum products), lead salts, mercury, and many others; and from exposure to various toxic by-products of industrial processes. The venom of some snakes, spiders, and scorpions causes poisoning.

What is a Poison?

When you consider all the different ways in which poisoning can occur, you might begin to wonder: What is a poison? Basically, it is a substance which causes bodily disturbance, injury, or death, by chemical rather than mechanical means. It would be almost impossible to list all poisons, because a great many substances are harmless if used in the proper way but are poisonous if used in the wrong way or in the wrong amount. For instance, nearly all drugs and medicines are potentially both beneficial and poisonous; the effect is determined by the method of use and by the amount taken into the body. Such things as alcohol, coffee, and tobacco are actually poisonous substances for which the human body has certain tolerances; poisoning results if these tolerances are exceeded. Powdered glass, needles, metal splinters, and other foreign bodies are damaging when applied to or introduced into the body, but they are not classified as poisons because their action is mechanical rather than chemical.

Variations in Effects of Poisons

The action of a poison is dependent upon several factors. The action will be more severe if a large dose is taken, because more of the poison will be absorbed in a short period of time. (Remember, of course, that the toxicity of substances varies greatly—a few drops of one poison might be immediately fatal, while another poison might not be harmful unless taken by the tablespoonful.) The age and body weight of the victim should also be considered. Infants, young children, and very old people are more likely to be killed by small doses of poison. In general, the less a person weighs the smaller will be the fatal dose. Another factor which influences the action of poisons taken by mouth is the condition of the stomach; poisons taken on an empty stomach will act much more quickly (and therefore more violently) than those taken when the stomach is full.

The action of any poison is dependent, also, upon the tolerance which the individual has for the particular substance. Some people seem to have a natural resistance to the action of certain poisons; others are so highly sensitive to them that even a small amount, such as might be given in a medicine, produces toxic effects. Habit is sometimes a factor to consider—drug addicts can tolerate doses of the habit-forming drugs which might kill the average person. The effectiveness of a poison is also dependent upon the general health of the victim.

7880

The physical state of the poisonous substance also determines its effectiveness. Gases are absorbed more quickly than liquids, and liquids more quickly than solids. Related to this is the fact that the way in which a poison enters the body determines to some extent the speed and effectiveness with which it acts. In general, inhaled poisons are likely to work most quickly, injected poisons next, and poisons taken by mouth more slowly. Poisoning by skin contact usually occurs quite slowly over an extended period of time. It should be noted also that some substances are poisonous when taken in one way, but not when taken in another; for example, snake venom may cause death when injected (as by a snakebite), but may be relatively harmless if swallowed.

General Symptoms of Poisoning

It is often very difficult to recognize a case of poisoning. Most poisons do not give rise to symptoms which are sufficiently uniform or characteristic to provide a sure means of identification. Many poisons cause symptoms which are so similar to those of various diseases that they cannot be readily distinguished.

In addition to these difficulties, there is the fact that the symptoms vary according to the amount of poison taken and the length of time it has been in the system. There may be several fairly distinct degrees or stages of poisoning, and the symptoms may be different in each stage.

However, there are some general signs which might indicate that a person has been poisoned. Intense pain frequently follows poisoning. Nausea and vomiting may occur. The victim may become delirious, or he may collapse and become unconscious. Poisoning by caustic acids, alkalis, phenols, and metallic salts is likely to cause corrosion, swelling, and bleaching of the skin, mouth, and throat. Brown or black stains on the skin or mucous membranes may be indicative of iodine poisoning; yellow stains may be caused by nitric acid and picric acid. Some poisons turn the urine red, dark green, bright yellow, or black; any unusual color may be well an indication of poisoning. Many substances cause the victim's breath to have a peculiar odor.

In almost all cases of acute poisoning, the victim is likely to have considerable trouble in breathing. Some poisons characteristically cause paralysis; others cause convulsions. Some poisons cause the pupils of the eye to contract (become smaller), and others cause them to dilate (become larger). The skin may be flushed or pale, or perhaps bluish in color. Shock is always present in cases of acute poisoning.

As you can see, almost any sign of bodily distress or disturbance MIGHT be an indication of poisoning. If you find a person who seems to be sick, or who shows any signs similar to those described, you must keep in mind the possibility of some kind of poisoning. Many times, your best information will come from the general circumstances in which you find the victim. An empty poison bottle, for example, would provide an obvious clue. Most situations are not likely to be that clear, but you should always look around for external evidence of that kind—often it will help you to understand the nature of the trouble.

Obtaining Professional Help

The United States Public Health Service maintains a clearinghouse for information about the symptoms and the methods of treatment for all types of poisons. It also identifies the poisonous ingredients in all kinds of commercial products. This information is received from, and furnished to, poison control centers at various medical establishments throughout the United States.

Emergency treatment is usually required in poisoning cases because poisons act very rapidly. If more than one person is present, one should be delegated to obtain assistance while the other begins emergency treatment. If only one person is present, help should be sought as soon as the patient can safely be left alone for a time. Treatment by a physician or assistance from a poison control center should be obtained as soon as possible. This is important even when the symptoms of poisoning have disappeared completely before professional help can be obtained because the poison may have harmful effects that do not appear immediately.

FIRST AID TREATMENT FOR POISONING

The first aid treatment which is appropriate for any given case of poisoning depends partly upon the method by which the poison enters the body. The four ways in which poisoning is likely to occur are: (1) By ingestion—that is, taking the poison into the stomach by way of the mouth; (2) by inhalation—that is, breathing poisonous gases; (3) by skin contact; and (4) by injection

887881

into the bloodstream or into muscular tissue. First aid treatment for various common poisons which are absorbed into the body in one or more of these ways is given in the following sections.

Ingested Poisons

There are a great many substances that are poisonous, if swallowed. Because there are so many, it would be impossible to remember the detailed treatment for each kind of poison. However, most poisons may be assigned to one of several general classifications according to their effects on the body and the symptoms of poisoning. Generally, the proper FIRST AID TREATMENT may be determined by the general classification in which a certain poison falls.

Corrosives

Corrosives are substances that rapidly destroy or decompose the body tissues they contact. Corrosives may be ACIDS (hydrochloric, nitric, sulfuric); PHENOLS (carbolic acid, creosol (Lysol), creosote); or ALKALIES (lye, lime, ammonia). Iodine is also a corrosive.

General Symptoms.—When corrosives are swallowed, immediately there is burning pain in the mouth with severe burning pain in the esophagus and stomach. This is followed by retching and vomiting; the stomach contents are mixed with dark colored liquid and shreds of tissues that line the mouth, esophagus, and stomach. The inside of the mouth is eaten away and the lips are characteristically stained if an acid or iodine has been swallowed. Swallowing is very difficult, breathing is difficult, the abdomen is tender and distended with gas, body temperature is high, and the facial expression shows anxiety and great suffering.

Irritants

Irritants are substances that do not directly destroy the body tissues but cause inflammation in the area of contact. Some examples are potassium nitrate, zinc chloride, zinc sulfate, arsenic, iodine, and phosphorus.

General Symptoms.—When swallowed, the irritants cause faintness, nausea, vomiting, and diarrhea. The vomited matter and stools frequently contain blood. Also, there is pain, with cramps, in the abdomen.

Depressants

Depressants are substances that depress the nervous system. Some examples of depressants are the alkaloids (including atropine, and morphine and its derivatives), bromides, barbiturates, alcohol, and most local anesthetics.

General Symptoms.—When swallowed, depressants usually have an initial stimulative effect, so the symptoms may begin with a short period of excitement. This is soon followed by drowsiness and stupor; slow breathing, with snoring; cold, moist skin with the face and fingers a bluish color; relaxed muscles; and dilated or contracted pupils.

Excitants

Excitants are substances that stimulate the nervous system. Some examples are strychnine, camphor, and the fluorides.

General Symptoms.—When swallowed, excitants cause delirium (mental disturbance, physical restlessness, and incoherence); a feeling of suffocation and inability to breathe; hot, dry skin; rapid, weak pulse; convulsions or jerking muscles; and dilated or contracted pupils.

Emetics, Demulcents, and Antidotes

As with other common emergencies, it is likely that the materials necessary to treat a case of poisoning will not be available when needed. You will have to use what is available. Fortunately, some relatively common substances are effective emetics, demulcents, or antidotes.

Emetics.—An emetic is a substance that causes vomiting. Emetics are not very effective in cases of depressant poisoning because depressants inhibit the vomiting reflex. In such cases, vomiting may be brought on by tickling the throat. The following substances are effective emetics:

1. Powdered mustard—1 to 3 teaspoonfuls in a glass of warm water.
2. Salt (sodium chloride)—2 teaspoonfuls in a glass of warm water.
3. Warm water with soapsuds (not detergents). This emetic has an antidotal effect for a many metallic salts, especially mercuric chloride.
4. Large quantities of warm water.

187082

Demulcents.—A demulcent is a substance that will soothe the stomach and delay absorption of the poison. Periodically, after the victim has vomited, he should be given a demulcent. Raw egg whites, milk, or a thin paste of cooked starch or flour are effective.

Universal Antidote.—When the exact nature of the poison is known, the specific antidote should be used, but if it is not available, the best antidote available should be used rather than delay treatment until the specific antidote can be obtained.

A universal antidote has been devised for use when the nature of the poison is not known. It is especially effective against the irritants, the excitants, and the depressants. The universal antidote contains ingredients that either cause the poison in solution to form solid particles; combine with the poison to make it less harmful; or change it into a harmless chemical compound.

The universal antidote is prepared from the following ingredients:

Activated charcoal	2 parts(1/4 ounce)
Magnesium oxide	1 part (1/8 ounce)
Tannic acid	1 part (1/8 ounce)

The dose is 1/2 ounce in a half glass of water, given by mouth. It should be followed by an emetic, EXCEPT WHEN THE POISON IS A CORROSIVE. If these ingredients are not available, substitute burned toast or charred wood in place of activated charcoal; milk of magnesia for magnesium oxide; and strong tea for tannic acid.

Antidotes for Acids.—When poisonous acids are swallowed, the acids must be neutralized. Milk of magnesia, magnesium oxide, lime water, or soap given in large amounts of water are effective. This should be followed by a demulcent. DO NOT GIVE EMETICS WHEN THE POISON IS ACID.

Antidotes for Alkalies.—When poisonous alkalies are swallowed, the alkalies must be neutralized. Diluted vinegar, lemon juice, or grapefruit juice are effective. This should be followed by a demulcent. DO NOT GIVE EMETICS WHEN THE POISON IS ALKALI.

Treatment of Poisoning by Mouth

The basic procedures for treatment of poisoning by mouth are:

1. Identify the specific poison or the type of poison, if possible. Note the symptoms, the contents of glasses or bottles, and other related sources of information.

2. Remove the bulk of the poison from the stomach quickly. Use an emetic, EXCEPT WHEN THE POISON IS CORROSIVE.

3. Administer the antidote. Have the victim swallow large quantities of the antidote; then give emetics to promote vomiting. Repeat this treatment at intervals of 10 minutes for as long as it appears that some poison remains in the stomach.

4. Give demulcents. Periodically, after the victim has vomited, give him a thin paste of starch, two raw egg whites, or milk. Do not give milk if phosphorus has been swallowed. When the poison is a corrosive, demulcents should be given between doses of the antidote.

5. After the poison has been removed from the stomach, give the victim epsom salts (1/2 ounce in a half glass of water) followed by large quantities of water. This will speed passage of any portion of the poison that has passed into the intestines, and prevent its absorption. If it is certain that the poison is not phosphorus, phenol, or other oil-soluble poisons, castor oil (1/2 fluid ounce) may be used.

6. Treat the victim for the effects of the poison. No definite outline of treatment can be given for the effects of ingested poisons. The victim should be treated for shock and given artificial respiration, if necessary. Stimulants (strong coffee or tea) may be given in most cases. The notable exceptions are iodine and strychnine poisoning. Alcohol, as a stimulant, should not be used as a first aid measure. ALWAYS GET MEDICAL ASSISTANCE AS SOON AS POSSIBLE.

You must also take possession of all foods, medicines, vomited matter, feces, urine, and anything that may be of value in determining the identity of the poison and whether it was taken accidentally or intentionally, or whether it was criminally administered.

Unknown Poisons.—For the purpose of first aid treatment of unknown poisons, the case may be considered as one of two kinds:

1. It may be a case where the local effects of the poison have injured the tissues lining the

7883

mouth, esophagus, and stomach to an extent that an emetic cannot be used safely. Poisons classified as CORROSIVES generally produce conditions such as these. They have an injurious and even destructive effect on the lining of the mouth and stomach. In such conditions, vomiting may cause a rupture of the stomach, therefore, emetics should not be given.

2. It may be a case where the poison has had little or no effect on the tissues lining the mouth, esophagus, and stomach and therefore, emetics can be used safely. Generally, poisons classified as IRRITANTS, DEPRESSANTS, and EXCITANTS do not injure or damage the tissues lining the mouth or stomach, and emetics can be used without fear of injuring the victim.

Even when the exact nature of the poison is unknown, it usually is not difficult to determine whether the poison is corrosive. A corrosive leaves unmistakeable signs about the lips and mouth. When the local condition points to a corrosive poison, the evidence usually indicates also whether it is of the acid or alkali type.

ACIDS burn the lips, mouth, tongue, and throat and leave a characteristic stain (dark-brown or black by hydrochloric and sulfuric acid; yellowish green to orange by nitric acid; brownish by acetic or oxalic acid). Generally, the treatment of all cases of acid poisoning is the same: do not use emetics; give the antidote (magnesia, lime water, soap in large of amounts of water); give demulcents (egg whites, milk); give stimulants; treat for shock.

ALKALIES leave a strong soapy taste in the mouth, and also cause severe burning pain in the mouth, throat, and stomach. The tissues become swollen and white and the lips and tongue swell. The throat may become swollen making breathing difficult. (Phenols, which are acids, also cause similar symptoms. However, phenols leave an odor of wood tar or coal tar, and the soapy taste is absent.) Generally, the treatment of all cases of alkali poisoning is the same; do not use emetics; give large amounts of the antidote (diluted vinegar, lemon juice, grapefruit juice); give demulcents (milk, egg whites, or others); give stimulants; treat for shock.

In cases where there are no signs of injury to the lining of the mouth, the probabilities are that the poison is one of the irritants, depressants, or excitants. Generally, the treatment for all is the same: use emetics to promote vomiting; give large amounts of the antidote (universal antidote); give demulcents (milk, egg whites, or others); give simulants, EXCEPT FOR EXCITANTS; treat for shock.

Poisonous Fish

Some fish are extremely poisonous. It is not always easy to distinguish the edible fish from the poisonous varieties, but the two general points to consider are the LOCATION in which you find the fish, and the APPEARANCE of the fish. Almost all poisonous fish are found in muddy or sandy waters near shore, or in shallow waters near rock or coral reefs. Almost all poisonous fish have round or box-shaped bodies. Edible fish have scales, but most poisonous fish have skin (either smooth or rough) instead of scales. Many of them are covered with bristles or spines. Most poisonous fish have small, parrot-like mouths, small gill openings, and small belly fins; some have no belly fins at all. Some poisonous fish are shown in figure 5-1; as you can see, they are quite different in appearance from ordinary edible fish.

Do not eat sea eels or barracuda, except when prepared professionally. Although they do not fit the general pattern of appearance of poisonous fish, there is considerable evidence to indicate that they may be poisonous in certain areas.

The symptoms caused by eating poisonous fish include nausea, vomiting, diarrhea, itching, cramps, paralysis, and a metallic taste in the mouth. The symptoms are likely to occur suddenly, from 1 to 6 hours after the poisonous fish has been eaten. There is no known antidote for the poison contained in these fish. If symptoms of poisoning appear, induce vomiting repeatedly until the stomach is well washed out. (As you will remember, salt water is a good emetic. Drink sea water until vomiting is induced; repeat as many times as necessary to make sure that the stomach is emptied.)

INHALED POISONS

Toxic vapors and fumes are an ever-present hazard in many industrial operations. Sometimes they are essential to the processes, and sometimes they are merely unwanted by-products. In the Navy, a great many industrial processes are carried out, both on board ship and at shore establishments, and consequently the whole problem of poisoning by inhalation is one with which all naval personnel must be familiar. Many ships, for example, carry on such a wide

7884

136.8

Figure 5-1.—Poisonous fish.

7885

variety of industrial operations—casting, molding, welding, plating, casehardening, and many others—that they are in effect floating industrial plants.

The routine operation of maintenance of a ship requires the use of an enormous number of materials, some of which have toxic properties when inhaled. Refrigeration machinery, fire-fighting equipment, paints and solvents, photographic materials, and many other types of shipboard equipment involve the use of volatile and sometimes poisonous chemicals. Also, the handling of large quantities of petroleum products—fuel oil and gasoline, in particular—constitutes a special hazard, since all of these products give off poisonous vapors.

Other poisonous gases are found in the undesirable but unavoidable by-products of certain operations or processes—exhaust gases from internal-combustion engines; fumes or vapors from materials used in metallurgical processes; gases associated with bacterial decomposition in closed spaces; and gases which accumulate in voids, double bottoms, empty fuel tanks, and similar places.

You cannot give first aid treatment to a person who has been overcome by a poisonous gas until you get him out of the toxic atmosphere and into a well-ventilated space. You will have to rescue the victim quickly, because inhaled poisons usually have a very rapid effect upon the body. However, take care to protect yourself from the dangers of the situation. Use appropriate protective equipment, and observe the safety precautions which are discussed in chapter 10.

You will be in a better position to effect a rescue and to give first aid if you know something about the properties of various toxic fumes and vapors. Let's see what gases most frequently cause poisoning, what their properties and uses are, and what kind of first aid is required when poisoning occurs.

Carbon Monoxide

Carbon monoxide is probably the most frequent cause of gas poisoning. As mentioned in chapter 3, this gas is colorless, odorless, and tasteless, and so gives no warning of its presence. Carbon monoxide is present in all exhaust gases of internal-combustion engines, in sewer gas, and in manufactured gas used for heating and cooking. Since it is formed by partial or incomplete combustion, carbon monoxide is almost always present in dangerous concentrations in any poorly ventilated space in which a fire has occurred.

The poisonous effect of carbon monoxide is due to the fact that it combines very rapidly with certain blood cells, in such a way as to prevent those cells from carrying oxygen. The first aid treatment for carbon monoxide poisoning follows:

1. Remove the victim from the toxic atmosphere to a well-ventilated space. Note, however, that the victim should not be taken outside in cold weather. A good supply of oxygen is essential for the elimination of the carbon monoxide, but exposure to cold air could actually cause collapse. Try to find a place which is comfortably warm, well-ventilated, and free from the poisonous gas.
2. Administer oxygen or an oxygen-carbon dioxide mixture, if an inhalator is available and if you know how to use it.
3. If breathing fails, give artificial respiration.
4. Keep the victim lying down, keep him warm, and keep him quiet. Rest is extremely important. The victim should be hospitalized as soon as possible, for treatment of the serious effects which often follow carbon monoxide poisoning.

Gasoline, Benzine, and Naphtha

Gasoline, benzine, and naphtha, and other petroleum products are poisonous if they are ingested, inhaled, or if they come into prolonged contact with the skin. Gasoline vapor is heavier than air, and tends to flow downward. It is highly explosive and flammable when mixed with air.

If liquid gasoline is swallowed, as sometimes happens in the course of siphoning, first aid should be given as described for other ingested poisons.

Inhaling gasoline fumes causes a kind of intoxication similar to that produced by alcohol. The first stage of gasoline intoxication produces a false sense of well-being and security. The victim's movements become unsteady and uncoordinated, and his ability to think is impaired. (Injury other than poisoning must be guarded against at this point—the victim is very likely to fall, or to be caught in moving machinery; or perhaps he may want to light a cigarette, not realizing that he is a highly flammable object.) Later stages of gasoline intoxication result in unconsciousness and a serious depression of

7886

breathing, which may be followed by death from asphyxiation. First aid treatment for a person who has inhaled gasoline vapors consists of the following:

1. Remove the victim to a well-ventilated place. Take off his contaminated clothing.
2. Give oxygen or an oxygen-carbon dioxide mixture, if available.
3. If the victim is not breathing, give artificial respiration.
4. Keep the victim lying down, keep him warm, and keep him quiet. Keeping him quiet is important, but it may not be easy to do. As he begins to recover he may pass through stages in which he is extremely violent and almost uncontrollable. In these stages he may be self-destructive or he may cause injury to others, unless he is very carefully guarded.

CAUTION: Do not give morphine.

Chlorinated Hydrocarbons

Carbon tetrachloride and other chlorinated hydrocarbons such as methylene chloride, chloroform, dichloromethane, and tetrachloroethane are widely used as solvents. They are very effective agents for dissolving oils, fats, and waxes. They are commonly used for dry cleaning, for degreasing metal articles, for cleaning electrical and electronic equipment, and for a variety of purposes in various manufacturing processes. They are sold for home use under many different trade names. They are not flammable—in fact, carbon tetrachloride is used as the extinguishing agent in some fire extinguishers. (It should be noted, however, that acute carbon tetrachloride poisonings have occurred as a result of using these extinguishers. Furthermore, it is extremely dangerous to use carbon tetrachloride as a fire-extinguishing agent because it decomposes in the presence of heat and forms phosgene gas.)

On board ship the chlorinated hydrocarbons have been used to clean and degrease many kinds of machinery and equipment. However, their use is now being restricted because they are extremely poisonous if they are swallowed, if their vapors are inhaled, or if they are allowed to remain in prolonged contact with the skin. Acute poisoning is most likely to occur from inhalation of the vapors. The vapors cause extreme irritation of the eyes, nose, throat, and lungs. When the chlorinated hydrocarbons are absorbed into the body they damage the liver and other vital organs.

The symptoms of poisoning are often delayed. A person who has been exposed to a toxic concentration of these vapors may not realize his condition until he becomes dangerously ill, some hours later. General signs which should lead you to suspect poisoning from these materials include headache, nausea, mental confusion, and in some instances a kind of drunken behavior similar to that caused by alcohol.

A further danger involved in the use of the chlorinated hydrocarbons is that they break down into extremely toxic agents when they are exposed to high temperatures. In particular, they form phosgene gas—a gas so deadly that it is used as a chemical warfare agent.

There is no known antidote for poisoning by carbon tetrachloride and the other chlorinated hydrocarbons. However, if a person has inhaled any of these vapors, you should give him the following treatment:

1. Remove him from the toxic atmosphere. Remove his contaminated clothes.
2. Give artificial respiration if necessary.
3. Keep the victim lying down and keep him quiet. Be sure that he is comfortably warm.
4. DO NOT give any fats, oils, or alcohol. These substances increase the absorption of the chlorinated hydrocarbons.

CAUTION: When the use of chlorinated hydrocarbons is unavoidable, as in cleaning such things as electrical and electronics equipment, be very careful not to inhale the vapors and not to allow any prolonged contamination of the skin. Treatment for this kind of poisoning is difficult, and recovery is by no means certain. Even a small amount of vapor can be dangerous. In at least one instance, a person was hospitalized for weeks as a result of using carbon tetrachloride to clean the type on a typewriter. If the ventilation is poor, the vapor from one cupful of carbon tetrachloride can cause death. The Bureau of Medicine and Surgery has listed precautionary measures which MUST be observed by all personnel working with the chlorinated hydrocarbons. These measures include the following:

1. Chlorinated solvents shall be handled only by trained personnel and under competent supervision.
2. All hand operations in which chlorinated solvents are used must be performed in well-ventilated areas, preferably outdoors in the open air.
3. Impermeable gloves must be worn for handling these materials. If necessary, other

7887

impermeable garments—sleeves, aprons, etc.—must be worn.

4. Chlorinated solvents MUST NOT BE HEATED! The application of heat causes them to decompose and form PHOSGENE.

5. Hose (air-line) masks or organic-vapor respirators must be worn if adequate ventilation cannot be arranged.

6. Persons who are required to work with chlorinated solvents MUST NOT DRINK ALCOHOLIC BEVERAGES. The use of alcohol greatly increases susceptibility to this type of poisoning.

Freon

Freon is a colorless, odorless gas which is widely used as a refrigerant. Although it is generally classed as nonpoisonous, it is toxic in high concentrations. Dangerous conditions may be created by large leaks in a refrigeration plant, particularly in confined or unventilated spaces. First aid treatment for this type of poisoning is as follows:

1. Remove the victim from the toxic atmosphere.
2. In general, give the same treatment that you would give to a person who had been poisoned by one of the chlorinated hydrocarbons.
3. Attend to the victim's eyes. Freon is a powerful freezing agent, and even a very small amount can freeze the delicate tissue of the eye. Medical attention must be obtained as soon as possible, in order to avoid permanent damage to the eyes. In the meantime, put drops of clean olive oil, mineral oil, or other nonirritating oil in the eyes and make sure that the victim does not rub his eyes.

CAUTION: Freon is derived from carbon tetrachloride. Like carbon tetrachloride, it breaks down into PHOSGENE gas when it is heated.

Hydrogen Sulphide

Hydrogen sulphide is a colorless gas which smells like rotten eggs. However, its presence cannot always be detected by its odor because the gas paralyzes the sense of smell when it is present in high (and therefore toxic) concentrations. Hydrogen sulphide may be found in high concentrations in places where animal matter has been burned or has been allowed to decay. For example, a ship's compartment in which animal matter is rotting may contain a dangerous amount of this gas. Hydrogen sulphide is used in some industrial processes. It is flammable as well as poisonous.

The general signs of hydrogen sulphide poisoning are eye, nose, and throat irritation, and breathing difficulty. There is usually an abundant flow of tears. Breathing is at first deep, noisy, and gasping; later it is feeble and irregular. Death is caused by paralysis of the breathing center in the brain. First aid treatment for hydrogen sulphide poisoning follows:

1. Quickly remove the victim to a well-ventilated place.
2. Give artificial respiration, if necessary.
3. Give oxygen, if it is available.
4. Keep the victim as quiet as possible until medical help is obtained.

Ammonia

Ammonia is an industrial gas which is used in many different ways. One of its primary uses is as a refrigerant. (Most shipboard refrigeration plants now use Freon, but ammonia is still used in many shore establishments.) Ammonia is pungent, biting, and extremely irritating. Personnel cannot remain in an atmosphere which contains one-tenth of one percent ammonia. The irritation causes coughing and a spasm of the air passages. Death may occur from asphyxiation. (See ch. 3.) The first aid treatment for a person who has inhaled ammonia fumes is as follows:

1. Remove the victim to a well-ventilated space.
2. Give artificial respiration, if necessary.
3. Give oxygen, if it is available.
4. Hold vinegar or a weak solution of acetic acid close enough to the victim's face so that he can inhale the fumes; but discontinue this if it does not give the victim relief.
5. Keep the victim quiet until medical help is obtained.

If you look back over the discussion of poisoning by inhalation, you will see that there are certain GENERAL RULES you can follow in giving first aid treatment for almost any case of poisoning which occurs in this way. These general directions are:

1. Get the victim out of the toxic atmosphere, into a well-ventilated space. Remove his contaminated clothing.
2. Watch his breathing. Give artificial respiration if necessary.
3. Give oxygen, or an oxygen-carbon dioxide mixture, if it is available and if you know how to use it.

7888

4. Keep him lying down. Keep him quiet. Treat him for shock.
5. CALL A MEDICAL OFFICER AS SOON AS POSSIBLE.

First aid for gas poisoning caused by chemical warfare agents is discussed in chapter 9.

POISONING BY SKIN CONTACT

Poisoning which occurs as a result of skin contact is not ordinarily a first aid problem. It is usually chronic in nature, rather than acute. Poisoning which occurs in this way may be very serious—and, in fact, it frequently results in death—but it usually builds up rather slowly, over a long period of time. It is basically, therefore, a problem for the medical officer rather than for the first-aider.

However, you should know something about the substances which most commonly cause poisoning in this way, since you will probably have to handle them at one time or another. Some of them are used on board ship, and others are used in the more extensive industrial processes which are carried out at shore establishments. Knowing something about these materials may help you avoid the dangers which are involved in handling them.

GASOLINE, BENZINE, NAPHTHA, and other petroleum products cause chronic poisoning if they are allowed to remain on the skin for any length of time. High-octane gasoline, in particular, is dangerous because it contains tetraethyl lead, which is quite easily absorbed through the skin. Tetraethyl lead poisoning may result from such operations as cleaning fuel storage tanks and handling high-octane gasoline.

Other LEAD COMPOUNDS can also cause poisoning by absorption through the skin. People who are regularly exposed to lead compounds may develop chronic lead poisoning. (For example, many painters develop chronic lead poisoning, because some paints contain lead compounds.) Constant handling of MERCURY, ARSENIC, and certain other metals and metallic compounds may in the same way lead to chronic poisoning.

Among the most dangerous of the common substances, from the point of view of poisoning by skin absorption, are the CHLORINATED SOLVENTS such as CARBON TETRACHLORIDE. When absorbed through the skin, these chemicals cause serious damage to the liver, the kidneys, and other vital organs of the body. All safety precautions MUST be observed in handling the chlorinated hydrocarbons. These solvents must never be used for any purpose if a less toxic substitute can be found. Remember, THERE IS NO REAL CURE FOR THIS KIND OF POISONING.

Trinitrotoluene (TNT) is the most widely used of all military high explosives. Poisoning caused by handling TNT is fairly common, on board ship and in naval magazines ashore. Inhaling the fumes can also cause poisoning. If a person who has been handling TNT shows any toxic symptoms he should be moved away from the area immediately. The poison can be removed from the skin with a solution of sodium hyposulphite. Give the victim plenty of fresh air, and keep him absolutely quiet until medical aid is obtained.

Injected Poisons

Although there are a number of substances which are highly poisonous when injected into the human body, the only ones which are important from the point of view of first aid are those which are injected by the bites of spiders, scorpions, or snakes and fish stings.

Spiders and Scropions

SPIDERS and SCORPIONS are common in almost all parts of the world, and some of the more venomous varieties can cause serious poisoning. Adults rarely die from spider bites or scorpion stings, but they are often made seriously ill by them.

Tarantulas and black widows are probably the most common of the poisonous spiders. The bite of the black widow spider causes pain almost at once, and the pain spreads quickly from the region of the bite to the muscles of the back, shoulders, chest, abdomen, and limbs. The pain is usually accompanied by severe spasms of the abdominal muscles.

A bite from any other kind of poisonous spider is not likely to be so immediately painful. The bite itself may be felt as a sharp sting, but it is not usually accompanied by severe pain. About half an hour after the bite, the victim begins to feel painful muscle cramps. At first they are localized near the bite, but they soon spread to involve the other muscles of the body. Shock usually develops at about the same time, though it may be delayed for as much as an hour or two. The victim becomes restless and anxious. He may be very thirsty. Nausea and vomiting may occur.

Very often there is only slight visible evidence of a spider bite. Sometimes there is a slight local swelling which may or may not be accompanied by redness of the skin. The occurrence of these signs probably depends to some extent upon the location of the bite.

Scorpions sting, rather than bite; the stinger and the venon sac are located in the scorpion's tail. The sting causes immediate, intense pain. After a while, however, the area near the sting becomes numb and paralyzed. If the sting is on the arm or the leg, the paralysis may be so great that the limb will be useless for a time.

First aid measures for spider bites and scorpion stings are limited. Simply clean the wound and surrounding area with alcohol to rid them of bacteria. Treat the victim for shock; keep him lying down, quiet, and warm. Severe muscle cramps and pain may sometimes be relieved by warm-water baths. Do not apply suction and do not incise (cut) the wound in an attempt to remove the poison. These actions do no good.

Snakebite

Two kinds of poisonous snakes, the Crotalidae and the Elapidae, are present in the United States. The Crotalidae (frequently called the "pit viper" family) are abundant and include the true rattlesnakes, the pygmy rattlers, copperheads, and water moccasins. The family Elapidae has only one representative—the coral snake. The venom of the Crotalidae is hemotoxic (poisonous to the blood). The venom of the Elapidae (coral, cobra, kraits) contains a highly potent neurotoxin (poisonous to nerve tissues). In addition, some snake venom contains other toxins.

Antivenom.—The Armed Forces Medical Supply provides an antivenom kit which neutralizes the venom of hemotoxic snakes of North and South America, including the rattlesnake, cottonmouth, copperhead, fer-de-lance, and the bushmaster. Throughout the world, other antivenoms have been developed that neutralize the venoms of snakes peculiar to certain areas.

Administration of the antivenom should be accomplished by medical personnel. But if professional help is not available or is not going to be available, the antivenom should be given to save a life. Be certain you have properly identified the snake and have the right antivenom.

Identifying the Snake.—Identification of the snake should be established if at all possible. In some instances, recognition is not so easy. Identification characteristics vary with the locality; this is particularly true of coloration. In addition, much false information is circulated as, for example, "snakes which are poisonous all have triangular heads." Some snakes whose heads cannot be distinguished from their bodies are dangerously poisonous. In identifying the snake these points should be checked:

1. Arrangement of teeth. The presence of fangs immediately labels the snake as poisonous. In addition, the type of fang and its placement may provide a means of deciding its group. (See fig. 5-2).
2. Rattle. Presence of rattles immediately identifies the rattlesnake. However, rattles are often lost and their absence need not rule out this family of reptiles.
3. Sensory pits. Certain groups have a sensory organ between the nostrils and eyes placed in a "pit" and those with it are known as "pit vipers". All pit vipers are poisonous.
4. Color and pattern of coloration. Since color and pattern change with age and are dependent on other factors, they are not always reliable. However, they do help in identification and should be fixed in mind. One generalization can be made: longitudinally striped snakes (lengthwise along the body) are not poisonous. There is only one exception—a small, very rare type native to the Far East.

Symptoms.—The bite from the Crotalidae (pit vipers) may produce the following symptoms:

1. Tissue swelling at the site of the bite gradually spreading to surrounding areas. (Swelling occurs between 3 to 5 minutes following the bite, but may continue for as long as an hour and be so severe as to burst the skin.)
2. Severe pain at the site of the bite.
3. Escape of blood from the capillaries. (Accumulation of blood in the tissues may cause severe pain.)
4. Severe headache and thirst.
5. Bleeding from some of the internal organs into the intestines and excretory tracts may show as blood in urine and/or stool.

The bite from the Elapidae (coral, cobra, krait) may produce the following symptoms:

1. Irregular heartbeat, followed by generalized weakness and exhaustion, ending in shock.
2. Severe headache, dizziness, mental disturbances such as incoherent speech, stupor, mental confusion, and possibly unconsciousness. (Extreme pain is not characteristic.)

Identification of Snakes by Bite Impressions. A, nonpoisonous, no fangs, *family Colubridae* subfamily Colubrinae (U.S. garter snake, European ringed snake, black snake); B, poisonous, posterior fangs, fangs not hollow but grooved slightly, *family Colubridae* subfamily Boiginae (boomslang of Africa); C, poisonous, anterior fangs, fangs relatively short, deeply grooved, *family Elapidae* (kraits, mambas, water cobras, cobras, and coral snakes) and *family Hydrophidae* (sea snakes); D, poisonous, anterior fangs markedly separated from teeth, fangs long, relatively large, and completely hollow, *family Viperidae* (horned, sand, and tree vipers, puff adders), *family Crotalidae* (rattlesnakes, copperheads, water moccasins, fer-de-lance).

136.9

Figure 5-2.—Identification of snakes by bite impressions.

3. Muscular incoordination such as inability to reach for and pick up an object or to move from place to place; sometimes muscle spasms and twitching.

4. Difficult or labored breathing and even respiratory paralysis.

5. Numbness and tingling of the skin particularly of the lips and soles of the feet and excessive sweating.

6. Chills and fever.

7. Nausea, vomiting, and diarrhea.

Treatment.—The first advice to give the snakebite victim is that he lie down and keep calm. Remind him that of those bitten, few die or are even disabled, if certain principals are followed. Since the identity of the snake is important in the selection of the antivenom, kill the snake (a sharp blow on the head is the best method) and, with a stick, examine the mouth for fangs. Fix the color and color pattern in mind and note the general appearance of the snake. (Unfortunately, most snakebites occur between twilight and daybreak when snakes are most active and identification most difficult. Identification in these situations can only be made by analyzing the symptoms.)

The following rules of first aid should be observed:

1. Immediately put the victim at rest and immobilize the affected part below the level of the heart. Keep him dry, warm, and quiet. Transportation should be by litter when possible.

2. When the bite is on the arm or leg, place a tourniquet 2 to 4 inches closer to the heart than the site of the bite. The tourniquet should be tight enough to stop the flow of blood in the veins but not in arteries. EXCEPTION: If the bite occurs in Africa, India, Burma, Thailand, or Australia where venoms that affect the nervous system are to be expected, or if the snake is positively identified as one possessing this type of venom, the tourniquet should be tight enough to restrict arterial flow and should be placed on the upper arm or upper leg where single bones make restriction possible. The tourniquet should be released for 30 seconds every 20 minutes to allow fresh blood to enter the extremity.

7891

3. If more than 1 hour is going to elapse before antivenom can be injected, TRAINED RESCUERS may employ incision and suction. With a sharp, sterile instrument (sterilized with a match if no other means is available) make two cuts, each not more than 1/2 inch long and 1/4 inch deep. The cuts should be made over the fang marks, lengthwise along the arm or leg. The incision must not injure tendons, muscles, blood vessels, or nerves. Suction may be performed by suction cup, if available, or by mouth and continued for at least 30 minutes. The sooner suction is started the better. If as much as an hour has passed since the bite was inflicted, incision and suction should not be used.

4. Antivenom should be given as soon as possible. This is best done by a physician because of difficulties that may arise from reactions to the serum. It should be administered as first aid only if medical assistance is not or will not be available and it is necessary to save the life of the victim.

5. Treat the victim for shock. Keep him lying down, make him as comfortable as possible, and keep him quiet. It may be necessary to give artificial respiration and cardiac massage. There are a number of cases on record where men have been kept alive as long as 2 hours after they became unconscious and have been saved by delayed injection of antivenom.

WHAT NOT TO DO: Morphine should not be given for pain when the venom is the type that affects the nervous system. Alcohol is forbidden—it speeds circulation. Ice packs and ice water should not be used—they have no proven value and may do considerable damage.

Self-aid for Snakebite.—The first point to keep in mind is that a nervous or frightened person is severely handicapped, so keep your emotions under control. If it is possible to kill the snake and look for fangs without a lot of excitement and activity, do so. If it is not, sit down at once, apply a tourniquet 2 to 4 inches above the site of the bite, incise the wound, and suck to remove the poison. Remain as quiet as possible and keep the wound lower than your heart.

If pain is great, if there is swelling, numbness, tingling, or continued oozing of blood at the bite site, you can be fairly sure that the snake is poisonous. Do not attempt to travel unless it is evident that no one is going to be coming for you—then walk slowly with a minimum of exertion for help.

Fish Stings

The stings of many sea creatures (portuguese man-of-war, jellyfish, stingray, scorpion fish, toadfish) are poisonous. The symptoms are many and varied, ranging from burning, stinging, reddening of the skin, hives, pus sores, abdominal cramps, numbness, dizziness, pain in the groin and armpits, nausea, muscular pain, difficulty of breathing, and constriction of the chest to prostration and shock.

For PORTUGUESE MEN-OF-WAR stings, remove the tentacles immediately and wash the skin surface with alcohol. Then apply calamine lotion or ammonia water. For JELLYFISH, treatment is about the same. Apply ammonia water, vinegar, or a soothing lotion. Artificial respiration is sometimes needed. Treat for shock.

The wound made by the stingray should be washed immediately with cold salt water. Much of the toxin will wash out, and the cold water causes blood vessels to constrict slowing circulation and acts as a mild pain-killing agent. The wound should then be immersed in hot water for 30 minutes to an hour. The water should be maintained at as high a temperature as the victim can stand without injury. (Hot compresses can be applied for wounds in areas that cannot be immersed.) A sterile dressing should be applied after the soak.

SUMMARY

Poisoning is the absorption of harmful chemical substances that cause illness, injury, or death. Absorption of poisons may occur through ingestion, inhalation, skin contact, and injection.

The symptoms of poisoning may vary greatly, depending on the type of poison, the amount and the length of time it has been in the system, and the physical condition of the victim. Also, some persons are more susceptible to certain poisons than others. A poison that may produce violent reactions in some may produce only mild reactions in others.

Ingested poisons may be grouped according to their effects on the body and the symptoms they produce. Specific first aid treatment is determined by the classification into which the poison falls—corrosives, irritants, depressants, or excitants. In treating cases of ingested poisoning, the basic procedures are to identify the poison; remove the bulk of the poison from the

7892 1087

stomach; administer the antidote; give demulcents; hasten elimination of the remainder of the poison from the intestines; and treat the victim for the effects of the poison. Remember, emetics are not to be given for corrosives. If the specific antidote for the poison is known, use it; if not, use the best antidote available. The universal antidote may be given when the poison is unknown.

Gaseous poisons that are inhaled may destroy the oxygen-carrying ability of the blood and irritate or destroy the tissues of the lungs and the air passages. If poison is inhaled by a person, he should be removed immediately from the contaminated area. His lungs should then be ventilated by artificial respiration, and oxygen should be administered if necessary.

Some poisons have a damaging effect locally when they contact the skin and the tissues lining the mouth, nose, and throat; and some may be absorbed, entering circulation and causing damage elsewhere in the body. Poisons can be removed from accessible places by washing with water or, if the poison is not water soluble, with alcohol. A chemical antidote can be added to the water. Antidotes for acids are soap, baking soda, borax, or lime water; for alkalies, diluted vinegar or lemon juice.

Injected poisons cannot be removed from the body effectively using first aid measures. The use of a tourniquet will delay absorption of the poison and thereby lower the concentration in the circulatory system so that the body may be able to eliminate the poison without fatal effects. In giving aid to victims of snakebite, make every effort to identify the snake as this is very important to both the treatment and the antivenom to be used. Antivenom should not be administered as a first aid measure, except to save a life, nor should incision and suction be employed, except by trained personnel. Incision and suction should not be employed at all, if antivenom can be injected within 1 hour, or if 1 hour has elapsed since the bite was inflicted.

Treatment by medical personnel should be obtained in all cases of poisoning as soon as possible. Even when the symptoms of poisoning have disappeared completely the poison may have harmful effects that do not appear immediately.

7893

CHAPTER 6

WOUNDS

Any injury which causes a break in the skin or other body membranes or in the underlying tissues is known as a WOUND. The two main dangers involved in this type of injury are SERIOUS BLEEDING and INFECTION. Serious bleeding has been discussed in chapter 2. In this chapter we will take up the classification of wounds, the general treatment of fresh wounds, special problems which arise because of the location of the wounds, the general problem of infection, and the use of dressings and bandages in the first aid treatment of wounds.

CLASSIFICATION OF WOUNDS

Wounds may be classified according to their general condition, their size, their location, the manner in which the skin or tissue is broken, and the agent which caused the wound. It is usually necessary for you to consider some or all of these factors in order to determine what first aid treatment is appropriate for a wound.

General Condition of the Wound

If the wound is fresh, first aid treatment consists mainly of stopping the flow of blood, treating for shock, and preventing infection. If the wound is already infected, first aid consists of keeping the victim quiet, elevating the injured part, and applying warm wet dressing. If the wound contains foreign objects, first aid treatment may include removing them if they are not too deeply embedded.

Size of the Wound

In general, large wounds are more serious than small ones because they usually involve more severe bleeding, more damage to the underlying organs or tissues, and a greater degree of shock. However, small wounds are sometimes more dangerous than large ones because they may become infected more easily.

Location of the Wound

Since a wound may involve serious damage to deeper structures, as well as to the skin and the tissues immediately below it, the location of the wound is an important consideration. For example: A knife wound in the chest is likely to puncture a lung and cause serious interference with breathing. The same type of wound in the abdomen might cause peritonitis (a dangerous infection in the abdominal cavity), or it might actually puncture the intestines, the liver, the kidneys, or other vital organs. A knife wound to the head might cause brain damage. And the same kind of a wound in a less vital spot (as, perhaps, an arm or a leg) might be relatively unimportant.

How the Skin is Broken

When considered from the point of view of the manner in which the skin or tissue is broken, there are five general kinds of wounds: Abrasions, incisions, lacerations, punctures, and crushed wounds. Many wounds, of course, are combinations of two or more of these basic types.

Abrasions.—Abrasions are made when the skin is rubbed or scraped off. "Rope burns," "floor burns," and "skinned" knees or elbows are common examples of abrasions. This kind of wound becomes infected quite easily, because dirt and germs are usually ground into the tissues.

Incisions.-Incisions, commonly called CUTS, are wounds made by sharp cutting instruments such as knives, razors, broken glass, etc. Incisions tend to bleed very freely because the blood vessels are cut straight across. There is relatively little damage to the surrounding tissues. Of all classes of wounds, incisions are

7894

least likely to become infected, since the free flow of blood washes out many of the microorganisms (germs) which cause infection.

Lacerations.—Lacerations are wounds which are torn, rather than cut. They have ragged, irregular edges, and masses of torn tissue underneath. These wounds are usually made by blunt, rather than sharp, objects. A wound made by a DULL knife, for instance, is more likely to be a laceration than an incision. Bomb fragments often cause lacerations. Many of the wounds caused by accidents with machinery are lacerations, although they are often complicated by crushing of the tissues as well. Lacerations are frequently contaminated with dirt, grease, or other material which is ground into the tissues; they are therefore very likely to become infected.

Punctures.—Punctures are caused by objects which penetrate some distance into the tissues while leaving a relatively small surface opening. Wounds made by nails, needles, wire, knives, and bullets are usually punctures. As a rule, small puncture wounds do not bleed freely; however, large puncture wounds may cause severe internal bleeding. All puncture wounds are very dangerous from the point of view of infection.

Crushed Wounds.—Crushed wounds are particularly subject to infection because the microorganisms which cause infection grow and multiply rapidly in the body cells which are destroyed by the crushing. Crushing of the tissues frequently accompanies lacerated wounds.

Cause of the Wound

Although it is not always necessary to know what agent or object has caused a wound, it is frequently helpful. Knowing what has caused the wound may give you some idea of the probable size of the wound, its general nature, the extent to which it is likely to be contaminated with foreign matter, and what special dangers must be guarded against.

TREATMENT OF FRESH WOUNDS

As we have seen, there are several ways of classifying wounds, and there are various special problems which must be considered in treating different kinds of wounds. However, there are three basic rules to be followed in the treatment of practically all fresh wounds: Stop the flow of blood, treat the victim for shock, and do whatever you can to prevent infection. In addition, it is sometimes necessary to remove foreign objects from a wound, and it is sometimes necessary to immobilize the injured part in order to prevent further damage.

Stopping the Flow of Blood

The first aid methods which are used to stop serious bleeding (described in chapter 2) depend upon the application of pressure. Pressure may be applied in three ways: (1) Directly to the wound; (2) at key pressure points throughout the body; and (3) by means of a tourniquet. You will recall that DIRECT PRESSURE should be tried first, and the other two methods should be used ONLY if direct pressure fails to stop the flow of blood. For almost all minor wounds, a combination of direct pressure and elevation of the wounded part will be sufficient to stop the bleeding.

Treating for Shock

Shock is likely to be severe in a person who has lost a large amount of blood or suffered any serious wound. Keep the casualty lying down on his back, with his feet and legs somewhat elevated—unless, of course, his injuries are such as to prevent the use of this position. Be sure that he is comfortably warm, but do not overheat him. Morphine may be given for relief of severe pain, if there is no head injury, no chest injury, and if the casualty is not in deep shock.

Preventing Infection

Any break in the skin or other body membrane (such as the mucous membrane which lines the nasal passages) is dangerous because it allows microorganisms (germs) to enter the wound. Although infection may occur in any wound, it is a particular danger in wounds which do not bleed freely, wounds in which torn tissue or skin falls back into place and so prevents the entrance of air, and wounds which involve crushing of the tissues. Incisions, in which there is a free flow of blood and relatively little crushing of the tissues, are least likely to become infected.

7895

Minor wounds should be washed immediately with soap and clean water, dried, and painted with a mild, nonirritating antiseptic. Benzalkonium chloride tincture, which is now found in most Navy first aid kits, is a good skin antiseptic; it does not irritate the skin, but it effectively destroys many of the microorganisms which cause infection. (Benzalkonium chloride is commonly sold under the name of Zephiran, or Zephiran chloride.) Apply a dressing if necessary.

Larger wounds should be treated only by medical personnel. You should not make any attempt to wash or clean a large wound, and you must not apply any kind of antiseptic. Merely cover the wound with a dry sterile compress and fasten the compress in place with a bandage.

Remember that PUNCTURE WOUNDS are very likely to become infected. In particular, tetanus (sometimes called "lockjaw") is likely to develop from puncture wounds unless preventive treatment is given in time. Although the microorganism which causes tetanus is found almost everywhere—in the ground, in street dirt, in house dust—it cannot grow and multiply in the presence of air. However, when the organism is carried into a puncture wound, where it is not exposed to air, ideal conditions for its growth are set up. All puncture wounds are dangerous, and must be treated by a medical officer.

A special kind of infection which must be guarded against in the case of ANIMAL BITES is the possibility of rabies (sometimes called "hydrophobia"). This disease is caused by a virus which is present in the saliva of infected animals. The disease occurs most commonly in dogs, but has been found in cats, wolves, foxes, goats, sheep, horses, pigs, and other animals; in fact, it is probable that all mammals are susceptible to it. The virus which causes rabies is ordinarily transmitted by a bite, but it can be transmitted by the saliva of an infected animal coming in contact with a fresh wound or with the thin mucous membrane of the lips or nose. The virus does not penetrate normal unbroken skin.

If rabies once develops in man, it cannot be cured and is always fatal. A preventive treatment is available which is very effective if it is given within a few days after the bite; this treatment is known as the Pasteur vaccine treatment. Since the vaccine can be given only by medical personnel, any person bitten by an animal MUST receive medical attention at the earliest opportunity. The victim should be transferred to the nearest medical facility, and a complete report of the circumstances should be given. Remember, PREVENTION is of utmost importance; no cure is possible after the symptoms begin to develop.

Immediate local treatment of the wound should be given. Wash the wound and the surrounding area carefully, using sterile gauze, soap, and sterile water. Use sterile gauze to dry the wound, and then cover the wound with a sterile dressing. Do NOT use any chemical disinfectant. Do not attempt to cauterize the wound in any way.

You will recall that fresh wounds are not ordinarily washed. However, a wound made by an animal bite should be washed immediately and thoroughly; all of the animal's saliva must be removed from the victim's skin in order to prevent further contamination of the wound. (CAUTION: DO NOT allow the animal's saliva to come in contact with open sores or cuts on your hands.)

When a person has been bitten by an animal, every effort must be made to catch the animal to keep it confined for a period of about 2 weeks. DO NOT kill it if there is any possible chance of catching it alive. The symptoms of rabies are not always present in the animal at the time the bite occurs, but the saliva may nevertheless contain the rabies virus. It is essential, therefore, that the animal be kept under observation until a diagnosis can be made. The Pasteur treatment is given if the animal develops any definite symptoms, if it dies during the observation period, or if for any reason the animal cannot be kept under observation.

Remember that any animal bite is dangerous, and MUST be treated by medical personnel.

Removing Foreign Objects

Many wounds contain foreign objects. Wood or glass splinters, bullets, metal fragments, bits of wire, fishhooks, nails, tacks, cinders, and small particles from grinding wheels are examples of the variety of objects or materials which are sometimes found in wounds. In some cases, first aid treatment for wounds includes the removal of such objects when they are near the surface and exposed. However, first aid treatment does NOT include the removal of deeply embedded objects, nor the removal of powdered glass, emerywheel particles, or any widely-scattered material of this nature. You should never attempt to remove bullets, but you should

try to find out whether the bullet remains in the victim; look for both entrance and exit wounds. The general rule to remember is this: Remove foreign objects from a wound, when you can do so easily and without causing further damage; but NEVER HUNT FOR, OR ATTEMPT TO REMOVE, DEEPLY-BURIED OR WIDELY-SCATTERED OBJECTS OR MATERIALS.

The following procedure may be used to remove a small object from the skin or tissues, if the object is near the surface and clearly visible:

1. Sterilize the skin over and around the object by painting the area with benzalkonium chloride tincture.

2. If necessary, pierce the skin with a sharp instrument (a needle, a razor, or a sharp knife) which has been sterilized by passing it through a flame several times.

3. Grasping the object at the end, remove it. Tweezers, small pincers, or forceps (such as are contained in most Navy first aid kits) may be used for this purpose. Whatever instrument you use should first be sterilized by boiling for 15 minutes.

4. If the wound is superficial, apply gentle pressure to encourage bleeding.

5. Cover the wound with a dry sterile dressing.

If the foreign object is under a fingernail or toenail, you may have to cut a V-shaped notch in the nail so that the object can be grasped by the forceps. Do NOT try to dig the object out from under the nail with a knife or similar instrument.

A curved or barbed object such as a fishhook may present special problems. Figure 6-1 shows one method of removing a fishhook which has become embedded in the flesh. As you can see from figure 6-1 (A), the barb on the hook prevents its direct removal. However, if you push the hook forward through the skin, as shown in figure 6-1(B), you can clip off the barb with a wirecutter or similar tool, as shown in figure 6-1(C). The remainder of the fishhook can then be withdrawn in the manner indicated in figure 6-1(D).

Many eye wounds contain foreign objects. Dirt, coal, cinders, eyelashes, bits of metal, and a variety of other objects may become lodged in the eye. Since even a very small piece of dirt is intensely irritating to the eye, the removal of such objects is very important. However, the eye is very easily damaged. Impairment of vision (or even total loss of vision) can result from fumbling, inexpert attempts to remove foreign objects from the eye. The following precautions MUST be observed:

136.10

Figure 6-1.—Removing a fishhook.

1. DO NOT allow the victim to rub the eye.

2. DO NOT press against the eye, or manipulate it in any way which might cause the object to become imbedded in the tissues of the eye. Be very gentle; roughness is almost sure to cause injury to the eye.

3. DO NOT use such things as knives, toothpicks, matchsticks, wires, etc., to remove the object.

4. DO NOT UNDER ANY CIRCUMSTANCES ATTEMPT TO REMOVE AN OBJECT WHICH IS EMBEDDED IN THE EYEBALL OR WHICH HAS PENETRATED THE EYE!. If you see a splinter or other object sticking out from the eyeball, leave it alone! Only specially-trained medical personnel can hope to save the victim's sight if an object has actually penetrated the eyeball.

7897

Small objects which are lodged on the surface of the eye or on the membrane lining the eyelids can usually be removed by the following procedures:

1. Gently pull the lower lid down, and instruct the victim to look up. If you can see the object, try to remove it with the corner of a clean handkerchief or with a small cotton swab. You can make the swab by twisting cotton around a wooden applicator, not too tightly, and moistening it with sterile water. CAUTION: Never use DRY cotton anywhere near the eye. It will stick to the eyeball, or to the inside of the lids, and you will have the problem of removing it, as well as the original object.

2. If you cannot see the object when the lower lid is pulled down, turn the upper lid back over a smooth wooden applicator, as shown in figure 6-2. Tell the victim to look down. Place the applicator lengthwise across the center of the upper lid. Grasp the lashes of the upper lid gently but firmly. Press very gently with the applicator, and immediately pull up on the eyelashes, thus turning the lid back over the applicator. If you can see the object, try to remove it with a moist cotton swab or with the corner of a clean handkerchief.

3. If you are not successful in removing the foreign object by either of these two methods, try to wash the eye gently with lukewarm sterile water. A sterile medicine dropper or a sterile syringe can be used for this purpose. Have the victim lie down, with his head turned slightly to one side as shown in figure 6-3. Hold his eyelids apart. Direct the flow of water to the INSIDE corner of his eye, and let it run down to the OUTSIDE corner. Do not use any greater force than is necessary to keep the water flowing

136.11

Figure 6-2.—Turning the upper eyelid back over wooden applicator.

136.12

Figure 6-3.—Washing a foreign object from the eye.

7898

across the eye. Do NOT let the water fall directly onto the eyeball.

4. If the foreign object cannot be removed by any of the above methods, YOU MUST NOT MAKE ANY FURTHER ATTEMPTS TO REMOVE IT. Instead, place a small, thick gauge dressing over the eye and hold it in place with a LOOSE bandage or eye shield. (A firm bandage might drive the foreign object deeper into the eye.)

5. Get medical help for the victim at the earliest opportunity.

Preventing Movement

In giving first aid treatment to a person who has suffered a large wound, you may find it necessary to immobilize the injured part, since movement of the wound might cause a recurrence of bleeding, an increase in the severity of shock, and a general enlargement of the injury. Some wounds can be sufficiently immobilized by the application of a firm bandage; others may require splints. Methods of splinting are discussed in chapter 7.

SPECIAL WOUNDS

As we have seen, the basic first aid treatment for all fresh wounds consists of stopping the flow of blood, treating the victim for shock preventing infection, and—when necessary—removing foreign objects and immobilizing the injured part. Now let's consider some particular wounds which, because of their location, may require special first aid measures.

Chest Wounds

Wounds in the chest may involve lung damage and serious interference with breathing. If a lung is actually punctured, the victim is likely to cough up frothy, bright red blood. The proper first aid treatment for a person with a serious chest wound is as follows:

1. Close the wound at once, using any materials which are available. If possible, place a dry sterile pad (large enough to cover the wound completely) over the wound. Then apply an airtight pressure bandage. Strips of adhesive tape about 2 1/2 inches wide can be used, as shown in figure 6-4. It is very important that the dressing be airtight; otherwise, it will not relieve the victim's breathing difficulties.

136.13

Figure 6-4.—Airtight pressure bandage for chest wound.

If you do not have a large sterile compress and adhesive tape, you may be able to improvise a dressing which will hold the edges of the wound together. Clothing can be used to make the pad, or the bandage, or both. Use whatever materials you can find, and make the dressing as airtight as possible. If you can't find anything to use for a bandage, place one hand on each side of the wound and push the tissues together; hold the wound tightly closed until help arrives, or until you can improvise a better means of keeping the wound closed. Remember, you must keep the wound so tightly closed that air cannot go in and out by way of the wound.

2. Give oxygen, if the apparatus is available and if you know how to use it.

3. Treat for shock. Note, however, that it may be necessary to prop the victim up on pillows so that he will be able to breathe, in spite of the fact that this position is not ordinarily recommended for the treatment of shock. Keep the victim comfortably warm. As a rule, you should NOT give liquids to a person who has a chest wound, as he might choke on the liquid or get it into his lungs.

7899

Abdominal Wounds

A deep wound in the abdomen is likely to constitute a major emergency, since there are many vital organs in this area. Abdominal wounds usually cause intense pain, nausea and vomiting, spasm of the abdominal muscles, and severe shock. Immediate surgical treatment is almost always required; therefore, the victim must receive medical attention at once, or his chances of survival will be very poor. Give only the most essential first aid treatment, and concentrate your efforts on getting the victim to a hospital. The following first aid procedures may be of help to a person suffering from an abdominal wound:

1. Keep the victim lying down on his back. If the intestine is protruding or exposed, he may be more comfortable with his knees drawn up; place a coat, a pillow, or some other bulky cloth material under his knees to help him maintain this position. DO NOT ATTEMPT TO PUSH THE INTESTINE BACK IN, OR TO MANIPULATE IN ANY WAY!

2. If bleeding is severe, try to stop it by applying direct pressure.

3. Cover the wound with a dry sterile dressing, if the intestine is not exposed. If the intestine is exposed, apply a sterile compress moistened with sterile water. If no sterile water is available, clean seawater or any water which is fit to drink may be used to moisten the compress. Figure 6-5 shows an abdominal wound with the intestine protruding. As you can see from this illustration, the compress should be large enough to cover the entire wound and the surrounding skin. The compress should be held in place by a bandage. Fasten the bandage firmly, so that the compress will not slip around, but do not apply any more pressure than is necessary to hold the compress in position.

4. Give morphine for the relief of pain, unless the victim will receive medical attention very soon. Pain is likely to be severe, but this fact must be weighed against the consideration that medical diagnosis is much more difficult after the victim has been given morphine. Before giving morphine, therefore, try to estimate how long a time must elapse before medical aid can be obtained.

5. Treat for shock—but don't waste any time doing it. The victim must be transported to a hospital at the earliest possible opportunity. However, you can minimize the severity of shock by making sure that the victim is comfortably warm and by keeping him lying down on his back. DO NOT GIVE HIM ANYTHING TO DRINK. If he complains of great thirst, moisten his mouth with a small amount of water; but do not allow him to swallow any liquid.

136.14

Figure 6-5.—Abdominal wound with protruding intestine.

Head Wounds

Head wounds must be treated with particular care, since there is always the possibility of brain damage with injuries of this kind. The general treatment for head wounds is the same as that for other fresh wounds. However, certain special precautions must be observed if you are giving first aid to a person who has suffered a head wound:

1. NEVER GIVE MORPHINE.

2. Keep the victim lying flat, his head at the level of his body. Do not raise his feet. If his face is flushed, or if he is having trouble breathing, you may raise his head slightly.

3. If the wound is at the back of the head, turn the victim so that he is lying on his side.

Facial Wounds

Wounds of the face are treated, in general, like other fresh wounds. However, some kinds of face wounds present special problems. For example, if the lower jaw is shot away or seriously damaged, there is considerable danger that the

tongue may fall back into the throat and choke the victim. You can prevent this occurrence by running a safety pin or a thread through the middle of the tongue, pulling the tongue forward, and fastening the pin or thread to the victim's clothes.

A person with a serious face wound should ordinarily be kept lying face down, so that the blood from the wound will not clog his breathing passages or get into his lungs.

Facial wounds which involve the eyelids or the soft tissues around the eye must be handled very carefully in order to avoid further damage. If the injury does not involve the eyeball, apply a sterile compress and hold it in place with a FIRM bandage. If the eyeball appears to be injured, use a LOOSE bandage. (Remember that you must NEVER attempt to remove any object which is embedded in the eyeball, or which has penetrated it; just apply a dry sterile compress and hold it in place with a LOOSE bandage.)

Any person who has suffered a facial wound which involves the eye, the eyelids, or the tissues around the eye must receive medical attention as soon as possible. Be sure to keep him lying down; a stretcher must be used to transport him, so that he will not have to sit or stand.

Internal Wounds

External blows or impacts which do not break the skin frequently cause extensive internal damage. Internal injuries are not always thought of as wounds, because no blood shows on the surface of the body. However, if you remember the definition of a wound—any injury which causes a break in the skin or other body membranes or in the underlying tissues—you will see that many internal injuries are really wounds.

Internal wounds are frequently caused by pressure waves which result from the detonation of high explosives, either in the air or under water; if caused in this way, the wounds are usually referred to as BLAST or CONCUSSION injuries. Internal wounds may also be caused by any sudden forceful blow such as might occur in fights, in automobile accidents, or in accidents involving some kinds of machinery. Internal wounds of the lung sometimes occur when a broken rib punctures the lung.

In general, the organs which are most likely to be internally damaged by external blows or forces are the lungs and the intestines. If there is an internal wound of the lung the victim will cough up frothy, bright red blood; he will have difficulty in breathing, and may cough and gasp. If the injury is so severe that he cannot get enough oxygen, his face will be bluish in color. Internal wounds of the intestines usually cause severe pain and cramping, and immediate bowel movements; the stools are loose, and frequently tinged with blood.

Spontaneous internal bleeding, not caused by any external blow or force, sometimes occurs. Spontaneous bleeding from the LUNGS is most likely to be caused by tuberculosis. The blood which is coughed up is frothy and bright red; you will not generally be able to distinguish spontaneous bleeding from that which is caused by an external blow. Spontaneous bleeding from the STOMACH may be caused by ulcers. The blood is usually vomited up. It is dark brown or black in color; it is broken up into small clots, and so has somewhat the appearance of coffee grounds. However, if a person vomits blood which has this appearance, don't jump to the conclusion that he is suffering from stomach ulcers. Any blood which has been swallowed (as, for example, from bleeding of the mouth or nose) is dark and clotted when it is vomited up.

It is often difficult to recognize the presence of internal wounds. However, any person who is suffering from internal bleeding is likely to be restless, anxious, and thirsty, immediately after the injury; later these signs may be replaced by indications of more severe shock. In many cases of blast or concussion injury, signs of shock are the only indication of internal damage.

There is relatively little in the way of first aid that can be done for persons suffering from internal wounds. ALL INTERNAL INJURIES ARE SERIOUS. THEY REQUIRE IMMEDIATE MEDICAL ATTENTION. The first aid measures which are used in these cases have two purposes: (1) To minimize the severe shock which almost always accompanies internal injuries; and (2) to prevent further damage. First aid treatment should be given as follows:

1. Keep the victim lying down. If he has a chest wound, he will have difficulty in breathing and may have to be propped up. If he has an abdominal wound, he may be more comfortable with his knees drawn up; place some bulky material such as a coat or a pillow under his knees to help him maintain this position. If he has no breathing difficulty, and if he does not appear to be more comfortable with his knees drawn up, keep him lying flat on his back. Do not elevate his feet.

7901 S0ET

2. Be sure that the victim is comfortably warm, but do not overheat him.

3. Keep him as quiet as possible, and do not move him unless it is absolutely necessary. If you must move him, keep him lying down and handle him with great care. Any movement will probably make the injury worse.

4. Give morphine for the relief of pain, if the victim is breathing normally, without difficulty.

5. Give oxygen to a person with an internal chest wound, if the apparatus is available and if you know how to use it.

CAUTION: DO NOT give a person anything to drink if you suspect that he has an internal wound. If he complains of great thirst, moisten his mouth with a small amount of water, but do not let him swallow any of it.

INFECTION

The treatment of infected wounds is ordinarily a problem for medical personnel. However, you must know something about infected wounds so that you will know what to do if medical help is not immediately available.

Infections are dangerous in any part of the body, but particularly so in the area around the nose and mouth. Figure 6-6 shows this danger zone. From this area, infections spread very easily into the bloodstream, causing septicemia (blood poisoning), and into the brain, causing abscesses and infections there. Boils, carbuncles, and infected hair follicles just inside the nostril are perhaps the most common infections which occur in this area.

Symptoms of Infection

You are probably familiar with the general symptoms of infection. Heat, redness, swelling, and pain occur around the wound. Pus is often (although not always) visible. If the infection is severe, there may be an increase of body temperature (fever) and swelling of the glands in the neck, armpit, or groin. The presence of any of these signs should be taken as a possible indication of infection.

Treatment of Infected Wounds

There are three things you can do for a person who has an infected wound, while you are waiting for the medical officer:

1. Keep the person at rest, preferably in bed. Physical activity spreads the infection throughout the whole body.

2. Elevate the injured part, if possible. This will tend to reduce pain.

3. Apply a warm wet dressing to the infected wound and to the surrounding area. A large bulky pad should be used for this purpose; it may be made from a bandage, a towel, gauze, or any other clean cloth. The pad should be large enough to extend 5 or 6 inches in every direction beyond the infected wound, and it should be at least 1 inch thick.

Wet the pad with a solution of table salt and warm water (one teaspoonful of salt to a pint of water) or a solution of epsom salts and warm water (as much epsom salts as will dissolve in the water). The wet pad may be held in place by a bandage, if necessary.

For the first 6 hours of treatment, you should apply warm wet dressings continuously. Then allow the wound to dry for an hour. Apply warm wet dressings for another hour, and let

136.15

Figure 6-6.—Danger zone for infection.

dry for an hour again. Continue this alternating wet-dry treatment until a medical officer takes charge of the case, or until the symptoms of infection disappear.

If the infected wound is on a hand or a foot, soaking may be more convenient than applying wet dressings. The injured part should be immersed for several hours in a solution of salt and warm water or epsom salts and warm water, allowed to dry for half an hour or an hour, and then soaked again. Continue this treatment until medical advice is available or until the symptoms of infection disappear.

CAUTION: Never cut or squeeze an infected wound; never attempt to open it in any way. The pus or matter which is usually present in an infected wound contains both live and dead microorganisms. If you try to open the wound, you will probably force some of the living organisms into the blood-stream, where they will be carried by the blood to every part of the body. Serious (sometimes fatal) general infections can result.

COMPRESSES, DRESSINGS, AND BANDAGES

In general, the term DRESSING is used to describe everything which is used to cover or dress a wound. The sterile pad which is put directly over the wound is called a COMPRESS. A BANDAGE is used to hold the compress in position. A combined compress and bandage, in which the sterile gauze pad is fastened to a gauze, muslin, or adhesive bandage, is usually referred to as a dressing. Most Navy first aid kits contain both large and small dressings of this kind.

Any part of a dressing which is to come in direct contact with a wound should be absolutely sterile—that is, it should be free from microorganisms. The dressings which you will find in first aid kits have been sterilized. However, if you touch them with your fingers, your clothes, or any other unsterile object, they are of course no longer sterile. If you drag a dressing across the victim's skin, or allow it to slip after it is in place, the dressing is no longer sterile. An improvised dressing can be made sterile by boiling it for 10 to 15 minutes.

Emergencies sometimes arise in which it is impossible to obtain a regular sterile compress, and equally impossible to boil a piece of cloth in order to sterilize it. In such a situation, use the cleanest cloth available. A freshly laundered handkerchief, towel, shirt, etc., may be used; unfold it carefully so that you will not touch the part which goes next to the wound.

A compress should be large enough to cover the entire area of the wound, and to extend at least 1 inch in every direction beyond the edges. If the compress is not large enough, the edges of the wound are almost sure to become contaminated.

Materials which are likely to stick to a wound or which may be difficult to remove should NEVER be used directly over a wound. Absorbent cotton, collodion, impregnated cloth, adhesive tape, electrician's tape, and friction tape are examples of materials which should not come in contact with a wound.

Bandages

The two basic types of bandages which are most commonly used are the ROLLER BANDAGE and the TRIANGULAR BANDAGE.

Roller Bandage.—The roller bandage, shown in figure 6-7, consists of a long strip of material

136.16

Figure 6-7.—Roller bandages.

7903

(usually gauze or muslin) which is wound into a cylindrical shape. Roller bandages come in various widths and lengths. Most of the roller bandages found in first aid kits have been sterilized, so pieces may be cut off and used as compresses in direct contact with wounds. If you use a piece of roller bandage in this way, however, be very careful not to touch it with your hands or with any other unsterile object.

A piece of roller bandage may be used to make a FOUR-TAILED BANDAGE. This is done by splitting the cloth from each end, leaving as large a center area as necessary. Figure 6-8(A) shows a bandage of this kind. The four-tailed bandage is often used to hold a compress on the chin, as shown in figure 6-8 (B), or on the nose, as shown in figure 6-8 (C). It is particularly good for bandaging any protruding part of the body, because the center portion of the bandage forms a smoothly-fitting pocket when the tails are crossed over.

Triangular Bandages.—Triangular bandages are usually made of muslin. They are made by cutting a 36- to 40-inch square from a piece of cloth, and then cutting the square diagonally, thus making two triangular bandages. A smaller bandage of this kind may be made by folding a large handkerchief diagonally. The longest side of a triangular bandage is called the BASE; the corner directly opposite the middle of the base is called the POINT; and the other two corners are called ENDS. Figure 6-9 shows a triangular bandage with the base, point, and ends labeled. The triangular bandage is useful because it can be folded in a variety of ways to fit almost any part of the body.

The triangular bandage may be folded to form a CRAVAT BANDAGE, which is particularly useful in controlling bleeding from wounds of the scalp or forehead. To make the cravat, bring the point of the triangular bandage down to the base; then fold the bandage lengthwise along the middle. The cravat may then be used, or—if a narrower bandage is desired—it may be folded again along the middle. Figure 6-10 shows how to fold a triangular bandage into a cravat.

If specially prepared bandages are not available, use whatever material you can find. Remember that the basic purpose of a bandage is to hold the sterile compress in place. Any material and any method of application which does not cause further injury to the victim is adequate if it serves the purpose. Material used as a bandage does not have to be sterile, since it does not come in direct contact with the wound; it should, however, be as clean as possible.

Cloth bandages should be fastened by tying the ends with a SQUARE KNOT or by pinning the ends with strong safety pins. If you use a knot to fasten the bandage, be sure to use a square knot; as you know, this knot is easy to tie, does not slip, and can be untied quickly when

136.17

Figure 6-8.—(A) Four-tailed bandage. (B) Four-tailed bandage applied to chin. (C) Four-tailed bandage applied to nose.

136.18

7904

136.19

Figure 6-10.—Cravat bandage.

necessary. Be sure, also, that you place the knot so as to cause the least possible discomfort to the victim, and that you place it where it can be removed easily and quickly.

As a general rule, bandages should be applied firmly but not tightly. A bandage which is too loose is likely to slip off the wound. A bandage which is too tight may cut off some of the blood supply to the injured part, and may cause severe damage to the blood vessels and to the tissues. When you fasten a bandage around an arm or a leg, leave the fingers or toes exposed; if they become blue or swollen you will know that the bandage is too tight and should be loosened.

SUMMARY

A wound is a break in the skin, other body membrane, or underlying tissue. Several factors that should be considered in treating wounds are the size of the wound, condition of the wound, location of the wound, type of wound, and cause of the wound. Any one or a combination of these factors may alter somewhat the first aid treatment that should be given.

Basically, the most important steps in treating all wounds are to stop the flow of blood, to treat for shock, and to dress the wound to reduce the possibility of infection. However, in addition to these steps, certain wounds require special treatment.

Chest wounds should be closed immediately, using an airtight bandage. When the wound causes breathing difficulty, oxygen should be given, if the apparatus is available and you can use it. In treating for shock, place the casulaty in a sitting or semisitting position to aid breathing. Do not give morphine, unless breathing is normal.

In abdominal wounds, direct pressure is the only way to control bleeding. Cover the wound with a dry sterile dressing. If intestines protrude, cover the wound with a sterile compress moistened with sterile water. Keep the injured person on his back, either flat or with knees drawn up, whichever position is more comfortable. Do not give morphine if he will receive medical attention in a short time. Do not give liquids or solids by mouth.

For head wounds, never give morphine. Keep the injured person lying flat; do not lower his head. If his face is flushed, or if he has difficulty breathing, raise his head slightly.

Facial wounds should be given the same general treatment as other wounds, except that in treating for shock, keep the injured person lying face down, head turned to one side, so that blood from the wound will not clog breathing passages.

Eye wounds must be treated with extreme care to avoid further injury. Never attempt to remove objects embedded in the eyeball. Apply a thick, dry, sterile compress and fasten it with a bandage. If the eyeball is injured, apply a loose bandage, without pressure against the eyeball. If the eyeball is not injured, use a firm bandage. A person with an eye injury should not be allowed to sit or stand; keep him lying down, flat on his back.

A foreign object in the eye, which has not penetrated the eyeball, may be removed by gently pulling away the upper or lower eyelid and using the corner of a clean handkerchief or a small cotton swab moistened with sterile water (never dry) to dislodge it. If the object cannot be dislodged in this manner, wash the eye gently with lukewarm sterile water. If neither method is successful, make no further attempt

007 7905

to remove it. Apply a loose bandage and get medical assistance immediately.

Internal wounds, caused by external blows or impacts that do not break the skin, require immediate attention by medical personnel. Do not give morphine if medical assistance will be available soon or if breathing is difficult. Keep the injured person lying flat, except that for internal chest injuries raise the head and shoulders. For abdominal wounds, he may be more comfortable with knees drawn up. Do not give liquids to a person with internal wounds.

Infected wounds should never be cut, squeezed, or opened. Apply warm, wet dressings, using a solution of salt or epsom salts and warm water. Keep the infected part elevated.

Animal bites are dangerous because of the possibility of rabies infection. Immediately, wash the wound and the surrounding area thoroughly, using sterilie gauze, soap, and sterile water. After washing, dry the wound with sterile gauge and cover it with a dry sterile compress and bandage. All animal bites should receive prompt medical attention. In treating the wound, do not use any type of skin antiseptic or chemical disinfectant and make no attempt to cauterize the wound. Do not allow the animal's saliva to come in contact with open cuts or sores on your hands. If possible, catch the animal alive, and keep it confined. If it is necessary to kill the animal, or if it dies, cut off the head for laboratory examination.

CHAPTER 7

INJURIES TO BONES, JOINTS, AND MUSCLES

Many kinds of accidents cause injuries to bones, joints, or muscles. In giving first aid to an injured person, you must always look for signs of fractures (broken bones), dislocations, sprains, strains, and contusions.

An essential part of the first aid treatment for fractures consists of immobilizing the injured part with splints so that the sharp ends of broken bones will not move around and cause further damage to nerves, blood vessels, or vital organs. Splints are also used to immobilize severely injured joints or muscles, and to prevent the enlargement of extensive wounds. You must have a general understanding of the use of splints before going on to learn the detailed first aid treatment for injuries to bones, joints, and muscles.

USE OF SPLINTS

Some Navy first aid kits are supplied with basswood splints, which may be cut to the desired size; other kits contain wire mesh splints, which may be cut and then molded to the proper shape. These readymade splints are, of course, easier to apply than improvised splints; but in an emergency almost any firm object or material will serve the purpose. Such things as umbrellas, canes, swords, rifles, tent pegs, laths, sticks, oars, paddles, spars, wire, leather, boards, pillows, heavy clothing, corrugated cardboard, and folded newspapers can be used as splints. Adhesive tape is often used to splint a fractured rib. A fractured leg may sometimes be splinted by fastening it securely to the uninjured leg.

Splints, whether readymade or improvised, must fulfill certain requirements. They should be light in weight, but they must be strong and fairly rigid. They should be long enough to reach the joints above and below the fracture. Splints should be wide enough so that the bandages which are used to hold them in place will not pinch the injured part. Splints must be well padded on the sides which touch the body; if they are not properly padded, they will not fit well and will not adequately immobilize the injured part. If you have to improvise the padding for a splint, you can use articles of clothing, bandages, cotton, oakum, felt, blankets, or any other soft material. If the victim is wearing heavy clothes, you may be able to apply the splint on the outside, thus allowing the clothing to serve as at least part of the required padding.

To apply splints to an injured part, fasten them in place with bandages, strips of adhesive tape, pieces of rope, articles of clothing, or any other available material. If possible, one person should hold the splints in position while another person fastens them.

Although splints should be applied snugly, they should NEVER be tight enough to interfere with the circulation of the blood. When you are applying splints to an arm or a leg, try to leave the fingers or toes exposed. If the tips of the fingers or toes become blue or cold, or if the normal pink color does not quickly return when you press against the nails, you will know that the splints or bandages are too tight. You should examine a splinted part approximately every half hour, and loosen the fastenings if the circulation appears to be impaired. Remember that any injured part is likely to swell, and splints or bandages which are all right when applied may later be too tight.

INJURIES TO BONES

A break in a bone is called a FRACTURE. There are two main kinds of fractures. A SIMPLE FRACTURE is one in which the injury is entirely internal—that is, the bone is broken but there is no break in the skin. A COMPOUND FRACTURE is one in which there is an open

7907

wound in the soft tissues and the skin. Sometimes the open wound is made when a sharp end of the broken bone pushes out through the flesh; sometimes it is made by an object such as a bullet which penetrates from the outside. Figure 7-1 shows simple and compound fractures.

Compound fractures are more serious than simple fractures. They usually involve extensive damage to the tissues, and they are quite likely to become infected. Simple fractures are sometimes turned into compound fractures by rough or careless handling of the victim.

It is not always easy to recognize a fracture. All fractures, whether simple or compound, are likely to cause severe pain and shock; but the other symptoms may vary considerably. A broken bone sometimes causes the injured part to be deformed, or to assume an unnatural position; however, this is not always the case. Pain and swelling may be localized at the point of fracture, and there may be a kind of wobbly movement if the bone is broken clear through. It may be difficult or impossible for the victim to move the injured part; if he is able to move it, he may feel a kind of grating sensation as the ends of the broken bone rub against each other. However, if a bone is cracked rather than broken through, the victim may be able to move the injured part without much difficulty. A compound fracture is easy to recognize if an end of the broken bone protrudes through the flesh. If the bone does not protrude, however, you might see the external wound but fail to recognize the broken bone.

136.20

Figure 7-1.—Types of fractures. (A) Simple fractures. (B) Compound fractures.

If you are required to give first aid to a person who has suffered a fracture, you should follow these general rules:

- If there is any possibility that a fracture has been sustained, treat the injury as a fracture.
- Get medical aid at the first possible opportunity. All fractures require medical treatment.
- Do not move the victim until the injured part has been splinted, unless you must move him in order to save his life or prevent further injury.
- Treat for shock. Give morphine for the relief of severe pain, unless there is evidence of head injury. Remember, never give morphine to a person who has suffered a head injury!
- Do not attempt to locate a fracture by grating the ends of the bone together.
- Do not attempt to set a broken bone.
- When a long bone in the arm or leg is fractured, the limb must be carefully straightened so that splints can be applied. Never attempt to straighten the limb by applying traction with any improvised windlass or other device. Pulling gently with your hands in the long axis of the limb is permissible, and may be all that is necessary to get the limb back into position. If protruding bone ends are covered with dirt or other foreign matter which can be EASILY wiped off, they should be very gently cleaned with sterile cloth before the limb is straightened.
- Apply splints. If the victim is to be transported only a short distance, or if he will be seen very soon by a medical officer, it is probably best to leave his clothing on and place emergency splinting over it. However, if the victim must be transported for some distance, or if a considerable period of time will elapse before he can be treated by a medical officer, it may be better to remove enough clothing so that you can apply well-padded splints directly to the injured part. If you decide to remove clothing over the injured part, cut the clothing or rip it along the seams. In any case, BE CAREFUL! Rough handling of the victim may convert a simple fracture into a compound fracture, increase the severity of shock, and cause extensive damage to the blood vessels, nerves,

7908

muscles, and other soft tissues around the broken bone.

• If the fracture is compound, you must take care of the wound before you can deal with the fracture. Bleeding from the wound may be quite serious; however, most bleeding can be stopped by direct pressure on the wound or by digital pressure at the appropriate point. If these methods are not successful, use a tourniquet. (Methods of stopping serious bleeding are described in ch. 2.) When you have stopped the bleeding, give whatever further treatment is necessary for the wound, according to the principles discussed in chapter 6. Then treat the fracture. If one of the long bones of the arm or the leg is broken, straighten the limb carefully (using GENTLE traction) before applying splints. If one end of the bone protrudes, straightening the limb may draw it back into place. HOWEVER, YOU MUST NEVER ATTEMPT TO FORCE THE END OF THE BONE BACK INTO THE WOUND!

Now that we have seen the general rules for treating fractures, let's take up the symptoms and emergency treatment of fractures of the forearm, upper arm, thigh, leg, kneecap, collarbone, rib, nose, jaw, skull, spine and pelvis.

Fracture of the Forearm

There are two large bones in the forearm. When both are broken the arm usually appears to be deformed. When only one bone is broken, however, the other acts as a splint and the arm therefore retains a more or less natural appearance. (When the fracture is low, near the wrist, the deformity may be very clear even if only one bone is broken.) Any fracture of the forearm is likely to result in pain, tenderness, inability to use the forearm, and a kind of wobbly motion at the point of injury. If the fracture is compound, there will of course be an open wound, through which the bone may show.

Treatment.—If the fracture is compound, stop the bleeding and treat the wound. Apply a sterile dressing over the wound.

Carefully straighten the forearm. (Remember that rough handling of a simple fracture may turn it into a compound fracture.)

Apply two well-padded splints to the forearm, one on the top and one on the bottom. Be sure that the splints are long enough to extend from the elbow to elbow the wrist. Use bandages to hold the splints in place.

Put the forearm across the chest. The palm of the hand should be turned in, with the thumb pointing upward. Support the forearm in this position by means of a wide sling, as shown in figure 7-2. The hand should be raised about 4 inches above the level of the elbow.

As in all cases of fracture, treat the victim for shock and get medical attention for him as soon as possible.

Fracture of the Upper Arm

The signs of fracture of the upper arm include pain, tenderness, swelling, and wobbly motion at the point of fracture. If the fracture is near the elbow, the arm is likely to be fully extended—that is, it will be straight, with no bend at the elbow.

Treatment.—If the fracture is compound, stop the bleeding and treat the wound before attempting to treat the fracture.

NOTICE THAT TREATMENT OF THE FRACTURE DEPENDS PARTLY UPON THE LOCATION OF THE BREAK.

If the fracture is in the upper part of the arm, near the shoulder, place a pad or folded towel in the armpit, bandage the arm securely to the body, and support the forearm in a narrow sling.

136.21

Figure 7-2.—Sling used to support a fractured forearm.

6069 1910

If the fracture is in the middle of the upper arm, you can use one well-padded splint on the outside of the arm. The splint should extend from the shoulder to the elbow. Fasten the splinted arm firmly to the body, and support the forearm in a narrow sling, as shown in figure 7-3.

Another way of treating a fracture in the middle of the upper arm is to fasten two wide splints, or four narrow ones, about the arm, and support the forearm in a narrow sling. If you use a splint between the arm and the body, be very careful that it does not extend too far up into the armpit; a splint in this position can cause a dangerous compression of the blood vessels, and may be extremely painful to the victim.

If the fracture is at or near the elbow, you may find the victim with his arm either bent or straightened out. NO matter what position you find the arm in, DO NOT ATTEMPT TO STRAIGHTEN IT OR TO MOVE IT IN ANY WAY. As carefully as possible, splint the arm in the position in which you find it.

Treat the victim for shock, and get him under the care of a medical officer as soon as possible.

Fracture of the Thigh

The thighbone is the long bone of the upper part of the leg, between the kneecap and the pelvis. When the thighbone is fractured, any attempt to move the limb results in a spasm of the muscles and causes excruciating pain. The leg has a wobbly motion, and there is complete loss of control below the fracture. The limb usually assumes an unnatural position, with the toes pointing outward. The fractured leg is shorter than the uninjured one, by actual measurement, due to the pull of the powerful thigh muscles. Serious damage to blood vessels and nerves often results from a fracture of the thighbone. Shock is likely to be severe.

Treatment.—If the fracture is compound, stop the bleeding and treat the wound before attempting to treat the fracture itself. Serious bleeding is a special danger in this type of injury, since the broken bone may tear or cut the large artery in the thigh.

Carefully straighten the leg. Apply two splints, one on the outside of the injured leg and one on the inside. The outside splint should reach from the armpit to the foot. The inside splint should reach from the crotch to the foot. The splints should be fastened in five places: (1) Around the ankle; (2) over the knee; (3) just below the hip; (4) around the pelvis; and (5) just below the armpit. Both legs should be tied together, in order to support the injured leg as firmly as possible.

It is essential that a fractured thigh be splinted before the victim is moved. Ready-made splints are best, but improvised splints may be used. Figure 7-4 shows how a rifle may be used as an emergency splint for a fractured thigh. Remember, DO NOT MOVE THE VICTIM UNTIL THE INJURED LEG HAS BEEN IMMOBILIZED!

Treat the victim for shock, and get medical care for him at the earliest possible opportunity.

136.22

Figure 7-3.—Splint and sling for fractured upper arm.

136.23

Figure 7-4.—Rifle used as emergency splint for fractured thigh.

Fracture of the Lower Leg

When both bones of the lower leg are broken, the usual signs of fracture are likely to be present. When only one bone is broken, the other one acts as a splint and thus to some extent prevents deformity of the leg. However, tenderness and swelling at the point of fracture are almost always present. A fracture just above the ankle is often mistaken for a sprain. If both bones of the lower leg are broken, a compound fracture is very likely to result.

Treatment.—If the fracture is compound, stop the bleeding and treat the wound. Carefully straighten the injured leg. Apply THREE splints—one on each side of the leg and one underneath. Be sure that the splints are well padded, particularly under the knee and at the bones on each side of the ankle.

A pillow and two side splints work very well for treatment of a fractured leg. Place the pillow beside the injured leg, then carefully lift the leg and place it in the middle of the pillow. Bring the edges of the pillow around to the front of the leg, and pin them together. Then place one splint on each side of the leg, over the pillow, and fasten them in place with strips of bandage or adhesive tape.

Treat the victim for shock, and get medical care for him as soon as possible.

Fracture of the Kneecap

The following first aid treatment should be given for a fractured kneecap:

Carefully straighten the injured limb Immobilize the fracture by placing a padded board under the injured limb. The board should be at least 4 inches wide, and should reach from the buttock to the heel. Place extra padding under the knee and just above the heel, as shown in figure 7-5. Use strips of bandage to fasten the leg to the board in four places: (1) Just below the knee; (2) just above the knee; (3) at the ankle; and (4) at the thigh. DO NOT COVER THE KNEE ITSELF! Swelling is likely to be very rapid, and any bandage or tie fastened over the knee would quickly become too tight.

Treat the victim for shock, and obtain medical aid as soon as possible.

Fracture of the Collarbone

A person with a fractured collarbone usually shows rather definite symptoms. When the victim stands, the injured shoulder is lower than the uninjured one. He is usually unable to raise his arm above the level of his shoulder. He may attempt to support the injured shoulder by holding the elbow of that side in his other hand—this is, in fact, a characteristic position assumed by a person with a broken collarbone. Since the collarbone lies very near the skin, you may be able to detect the point of fracture by deformity and localized pain and tenderness.

136.24

Figure 7-5.—Immobilization of fractured kneecap.

Treatment.—If the fracture is compound, stop the flow of blood and treat the wound before attempting to treat the fracture.

Bend the victim's arm on his injured side, and place the forearm across his chest. The palm of his hand should be turned in, with the thumb point up. The hand should be raised about 4 inches above the level of the elbow. Support the forearm in this position by means of a wide sling.

Use a wide roller bandage (or any wide strip of cloth) to fasten the victim's arm to his body. The bandage should make several turns around the victim's body, and should go down over the hand so that the arm will be held close against the body.

Treat the victim for shock, and see that he receives medical attention as soon as possible.

Fracture of the Rib

A broken rib may cause severe pain at the point of fracture. Since the pain is greatly increased by the movements of coughing or deep breathing, the victim may breathe in a shallow, gasping way, and he may press his hands against his chest in an effort to prevent movement of the broken bone.

SJCT 7911

The greatest danger from a fractured rib is that the broken ends may cause lung damage. If a lung is actually punctured, the victim is likely to cough up frothy, bright red blood. (Emergency treatment for chest wounds is described in ch. 6.)

If the victim is reasonably comfortable, it is not necessary to apply any kind of bandage or splint. If the victim is in pain, however, he may be more comfortable if the fractured ribs are immobilized to some extent. Figure 7-6 shows how three cravat bandages may be used for this purpose. The cravat bandages should be applied in the following way:

1. Place the first bandage around the upper part of the chest and tie it in a LOOSE knot on the victim's UNINJURED side.
2. Place the second and third bandages a little lower down, and tie loosely.
3. Place a compress or pad UNDER the knots, on the victim's UNINJURED side.
4. Tighten the three bandages, one at a time, beginning with the top one. Each one should be tightened immediately after the victim has breathed OUT.

Fracture of the Nose

A fracture of the nose usually causes localized pain and swelling, a noticeable deformity of the nose, and extensive nosebleed.

Treatment.—Stop the nosebleed. Have the victim sit quietly, with his head tipped slightly backward. Tell him to breathe through his mouth, and tell him not to blow his nose. If the bleeding does not stop within a few minutes, apply a cold compress or an ice bag over the nose.

Treat the victim for shock, and see that he receives medical attention as soon as possible. Permanent deformity of the nose may result if the fracture is not treated promptly.

Fracture of the Jaw

A person who has a fractured jaw may suffer a serious interference with breathing. He is likely to have great difficulty in talking, chewing, or swallowing. Any movement of the jaw causes pain. The teeth may be out of line, and there may be bleeding from the gums. Considerable swelling may develop.

Treatment.—If the fractured jaw interferes with breathing, pull the lower jaw and the tongue well FORWARD and keep them in that position.

Apply a four-tailed bandage, as shown in figure 7-7. Be sure that the bandage pulls the lower jaw FORWARD. Never apply any bandage which forces the jaw backward, since this might cause a serious interference with breathing. The bandage must be firm, so that it will support and immobilize the injured jaw, but it must not press against the victim's throat.

Treat the victim for shock, and get medical attention for him as soon as possible.

136.25

Figure 7-6.—Cravat bandages used to splint fractured ribs.

136.26

Figure 7-7.—Four-tailed bandage for a fractured jaw.

7912

Fracture of the Skull

When a person suffers a head injury, the greatest danger is that the brain may be severely damaged; whether or not the skull is fractured is a matter of secondary importance. In some cases, injuries which fracture the skull do not cause serious brain damage; but brain damage can—and frequently does—result from apparently slight injuries which do not cause damage to the skull itself.

It is often difficult to determine whether an injury has affected the brain, because the symptoms of brain damage vary greatly. Any person who has suffered a head injury of any sort must be handled very carefully and given immediate medical attention.

Some of the symptoms which may indicate brain damage are listed below. However, you must remember that these symptoms are not always present in any one case, and that the symptoms which do occur may be greatly delayed.

- Bruises or wounds of the scalp may indicate that the victim has sustained a blow to the head. Sometimes the skull is actually depressed ("caved in") at the point of impact. If the fracture is compound, you may find bullets, glass, shrapnel, or other objects actually penetrating the skull.
- The victim may be conscious or unconscious. If he is conscious, he may feel dizzy and weak, as though he were going to faint.
- Severe headache sometimes (but not always) accompanies head injuries.
- The pupils of the eyes may be unequal in size, and may not react normally to light.
- There may be bleeding from the ears, nose, or mouth.
- The victim may vomit.
- The victim may be restless, and perhaps confused and disoriented.
- The arms, legs, face, or other parts of the body may be partially paralyzed.
- The victim's face may be very pale, or it may be unusually flushed.
- The victim is very likely to be suffering from shock, but the symptoms of shock may be disguised by other symptoms.

It is not necessary to determine whether or not the skull is actually fractured, when you are giving first aid to a person who has suffered a head injury. The treatment is the same in either case, and the primary intent is to prevent further damage to the brain.

Treatment.—Keep the victim lying down. If his face is flushed, raise his head and shoulders slightly. If his face is pale, have him lie so that his head is level with, or slightly lower than, his body. Do NOT allow him to sit or stand.

If there is serious bleeding from the wound, try to control it by the application of direct pressure.

Be very careful about moving or handling the victim. Do not move him any more than necessary. If you must transport him, keep him lying down.

Be sure that the victim is kept comfortably warm, but do not overheat him.

Do NOT give the victim anything to drink.

NEVER GIVE MORPHINE TO A PERSON WHO HAS A HEAD INJURY!

See that the victim receives medical attention as soon as possible!

Fracture of the Spine

The spinal cord, which contains nerve fibers in direct connection with the brain, is enslosed and protected by a bony structure known as the SPINAL COLUMN, or BACKBONE. The spinal column is made up of a number of small bones called VERTEBRAE.

If the spine is fractured at any point, the spinal cord may be crushed, cut, or otherwise damaged so severely that death or paralysis will result. However, if the fracture occurs in such a way that the spinal cord is not seriously damaged, there is a very good chance of complete recovery—PROVIDED the victim is properly cared for. Any twisting or bending of the neck or back, whether occurring from the original injury or from careless handling later, is likely to cause irreparable damage to the spinal cord.

The primary symptoms of a fractured spine are pain, shock, and paralysis. PAIN is likely to be acute at the point of fracture. SHOCK is usually severe, but (as in all injuries) the symptoms may be delayed for some time. PARALYSIS occurs if the spinal cord is damaged. If the victim cannot move his legs, feet, or toes, the fracture is probably in the back; if he cannot move his fingers, the neck is probably broken. Remember, however, that a spinal fracture does not always injure the spinal cord, so the victim is not always paralyzed. Any person who has

7913

an acute pain in the back or the neck, following an injury, should be treated as though he has a fractured spine, even if he has no other symptoms.

First aid treatment for all spinal fractures, whether of the neck or of the back, has two primary purposes: (1) to minimize shock, and (2) to prevent further injury to the spinal cord.

You will remember that, in general, there are three things you can do to treat for shock (1) keep the victim comfortably warm; (2) keep him lying down, with his head slightly lower than the rest of his body; and (3) give morphine for the relief of severe pain. Now let's see which of these measures can be used in the case of a person with a fractured spine:

You must keep him comfortably warm.

You must not attempt to keep him in the position ordinarily used for the treatment of shock, because getting him into this position might cause further damage to the spinal cord. Just keep him lying flat, and do NOT attempt to lower his head.

You may give him morphine, if he is suffering severe pain.

In order to avoid further damage to the spinal cord, DO NOT MOVE THE VICTIM UNLESS IT IS ABSOLUTELY ESSENTIAL. If he is lying in a place where his life is in immediate danger, or if he must be transported to some other place in order to receive medical attention, then of course you must move him. If it necessary to move him, however, be very sure that you do it in a way which will cause the least possible damage. DO NOT BEND OR TWIST THE VICTIM's BODY. DO NOT MOVE THE HEAD FORWARD, BACKWARD, OR SIDEWAYS. DO NOT UNDER ANY CIRCUMSTANCES ALLOW THE VICTIM TO SIT UP.

If it is necessary to transport a person who has suffered a fracture of the spine, follow these general rules:

- If the spine is broken at the NECK, the victim must be transported lying on his back, FACE UP. Place pillows or sandbags beside his head so that it cannot turn to either side. Do NOT put pillows or padding under his neck or head.
- If the spine is broken lower down—that is, if the BACK is broken—the victim should be transported lying FACE DOWN. However, if he must be transported any great distance he will be much more comfortable lying on his back, FACE UP, and so should be carried in this position. If he is carried in the face-up position, put padding under the small of his back.
- If you suspect that the spine is fractured, but do not know the location of the break, treat the victim as though he had a broken neck—that is, keep him lying on his back, FACE UP. If both the neck and the back are broken, keep the victim on his back, FACE UP.
- No matter where the spine is broken, USE A FIRM SUPPORT IN TRANSPORTING THE VICTIM. Use a rigid stretcher, or a door, shutter, wide board, or a frame similar to that shown in figure 7-8. Pad the support carefully, and put blankets both under and over the victim. Use cravat bandages or strips of cloth to fasten the victim firmly to the support.
- Hold the victim by his clothing and slide or pull him onto the support. DO NOT ATTEMPT TO LIFT HIM UNLESS YOU HAVE ADEQUATE ASSISTANCE! Remember, any bending or twisting of the body is almost sure to cause serious damage to the spinal cord. If there are at least four (preferably six) men present to help lift the victim, they can probably accomplish the job without too much movement of the victim's body,

136.27

Figure 7-8.—Improvised frame for transporting victim with fractured spine.

but a smaller number of men should NEVER attempt to lift the victim.

- Get medical help at once!

Fracture of the Pelvis

The large pelvic bones (sometimes called hipbones) and the lower bone of the spinal column together make up the bony structure which is known as the PELVIS. The joint between the thighbone (the long bone of the upper part of the leg) and the pelvic bone is called the HIP JOINT.

Fractures in the pelvic region often result from falls, heavy blows, and accidents which involve crushing. The great danger in any pelvic fracture is that the organs which are enclosed and protected by the pelvis may be seriously damaged when the bony structure is fractured. In particular, there is danger that the bladder will be ruptured. There is also danger of severe internal bleeding, because the large blood vessels in the pelvic region may be torn or cut by fragments of the broken bone.

The primary symptoms of a fractured pelvis are severe pain, shock, and loss of ability to use the lower part of the body. The victim is unable to sit or stand. If he is conscious, he may feel as though he is "coming apart." If the bladder is injured, the victim's urine may be bloody.

Treatment.—Do not move the victim unless ABSOLUTELY necessary!

Treat the victim for shock. Keep him comfortably warm, and give morphine for the relief of severe pain. (DO NOT attempt to move him into the position ordinarily used for the treatment of shock.)

If you must transport the victim to another place, handle him with the utmost care. Use a rigid stretcher or a padded door or wide board. Keep the victim lying on his back. In some cases he will be more comfortable if his legs are straight; in other cases he will be more comfortable with his knees bent and his legs drawn up. When you have placed him in the position in which he is most comfortable, immobilize him as shown in figure 7-9. Bandage his legs together at the ankles and at the knees. Then place a pillow beside each hip, and fasten the pillows in place with bandages or strips of cloth. Fasten the victim securely to the stretcher or improvised support.

Get medical help at once!

136.28

Figure 7-9.—Method of immobilizing fractured pelvis. (Legs may be straight or bent at the knee.)

INJURIES TO JOINTS AND MUSCLES

Injuries to joints and muscles often occur together, and sometimes it is difficult to tell whether the primary injury is to a joint or to the muscles, tendons, blood vessels, and nerves near the joint. Sometimes, also, it is quite difficult to distinguish joint or muscle injuries from fractures. In case of doubt, ALWAYS treat any injury to a bone, joint, or muscle as though it were a fracture.

In general, joint and muscle injuries may be classified under four headings: (1) dislocations; (2) sprains; (3) strains; and (4) contusions (bruises). Now let's take up these four types of injuries, and see how to recognize them and how to treat them.

Dislocations

When a bone is forcibly displaced from its joint, the injury is known as a DISLOCATION. In some cases the bone slips back quickly into its normal position, but in other cases it becomes locked in the new position and remains dislocated until it is put back into place. Dislocations are usually caused by falls or blows, but are occasionally caused by violent muscular exertion. The joints which are most frequently dislocated are those of the shoulder, hip, finger, and jaw.

A dislocation is likely to bruise or tear the muscles, ligaments, blood vessels, tendons, and nerves near the joint. Rapid swelling and discoloration, loss of ability to use the joint, and severe pain and shock are characteristic symptoms of dislocations. The fact that the injured part is usually stiff and immobile, with marked deformation at the joint, will help you to distinguish a dislocation from a fracture. (In a

7915

fracture, you remember, there is deformity BETWEEN joints rather than AT joints, and there is generally a wobbly motion of the broken bone at the point of fracture.)

As a general rule, you should NOT attempt to "reduce a dislocation"—that is, put a dislocated bone back into place—unless you know that medical assistance cannot be obtained within 3 or 4 days. Unskilled attempts at reduction may cause great damage to nerves and blood vessels, or may actually fracture the bone. Except in great emergencies, therefore, you should leave this treatment to the medical officer, and concentrate your efforts on making the victim as comfortable as possible under the circumstances. The following first aid measures will be helpful:

- Loosen the clothing around the injured part.
- Place the victim in the most comfortable position possible.
- Support the injured part by means of a sling, pillows, bandages, splints, or any other device which will make the victim comfortable.
- Treat the victim for shock.
- Get medical help as soon as possible.

You should NEVER attempt to reduce the more serious dislocations, such as those of the shoulder or the hip. However, if it is probable that the victim cannot be treated by a medical officer within a reasonable time, you should make a careful effort to reduce minor dislocations, such as those of the jaw or the finger.

Dislocation of the Jaw.—When the lower jaw is dislocated, the victim cannot speak and cannot close his mouth. Dislocation of the jaw is usually caused by a blow on the mouth; sometimes it is caused by yawning or laughing. This type of dislocation is not always easy to reduce, and there is considerable danger that the operator's thumbs will be bitten in the process. For your own protection, therefore, you must wrap your thumbs with a handkerchief or bandage. Stand in front of the victim, facing him. Press your thumbs down just behind the victim's last lower molars and, at the same time, lift his chin up with your fingers. The jaw should snap into place at once; you will have to remove your thumbs quickly in order to avoid being bitten. No further treatment is required, but you should warn the victim not to open his mouth any more than necessary during the next few hours.

Figure 7-10 shows the position you must assume in order to reduce a dislocated jaw.

136.29

Figure 7-10.—Position for reducing dislocated jaw.

Dislocation of the Finger.—The joints of the finger are particularly susceptible to injury, and even minor injuries may result in prolonged loss of function. Great care must be used in treating any injury of the finger.

To reduce a dislocation of the finger, grasp the finger firmly and pull it slowly into position. If it does not slip into position, try it once more; but if it does not go into position on the second attempt, DO NOT TRY AGAIN. In any case, whether or not the dislocation is reduced, the finger should be strapped or splinted until the victim can receive medical attention. Figure 7-11 shows how a dislocated finger can be immobilized by strapping it to a flat wooden stick, such as a tongue depressor.

Sprains

A SPRAIN is an injury to the ligaments which support a joint. A sprain usually involves a momentary dislocation, with the bone slipping back into place of its own accord. A sprain is caused by the violent wrenching or twisting of the joint beyond its normal limits of movement. Although any joint may be sprained, sprains of the ankle, wrist, knee, and finger are most common.

Tearing of the supporting ligaments is probably the most serious part of a sprain, but there is also a considerable amount of damage to the

7916

136.30

Figure 7-11.—Immobilization of dislocated finger.

blood vessels and other soft tissues which surround the joint. When the blood vessels are damaged, quite a lot of blood escapes into the joint itself and into the tissues. This causes the severe pain and marked swelling which are characteristic of a sprain.

Treatment.—Immobilize the injured joint with some type of splint or with a snugly-fitting adhesive or elastic bandage, in order to put the injured ligaments at rest. (Be careful to loosen the bandage if it becomes so tight that it interferes with the circulation of the blood. Remember that the injured part may continue to swell, so a bandage which is loose enough when applied may soon be too tight.)

Elevate the injured part, if possible; this will help to reduce the pain and swelling.

Apply COLD cloths or an ice bag to the injured joint for the first 24 hours.

CAUTION: It is very difficult to tell the difference between a sprain and a fracture. If you are not sure which injury is present, always treat it as a fracture until the victim has been brought under the care of a medical officer or until improvement more or less rules out the possibility of fracture.

Strains

An injury caused by the forcible overstretching or tearing of a muscle or tendon is known as a STRAIN. Strains may be caused by lifting excessively heavy loads, by sudden or violent movements, or by any other action which pulls the muscles beyond their normal limits.

The chief symptoms of a strain are pain, lameness or stiffness (sometimes involving knotting of the muscles), moderate swelling at the place of injury, and discoloration due to the escape of blood from injured blood vessels into the tissues.

Treatment.—Rest the injured part. If the injured muscle is in an arm or leg, elevate the part. Apply COLD to the area by means of cold compresses or an ice bag.

Contusions

CONTUSIONS, commonly called BRUISES, are responsible for the discoloration which almost always accompanies injuries to bones, joints, and muscles. Contusions are caused by blows which damage bones, muscles, tendons, blood vessels, nerves, and other body tissues, although they do not necessarily break the skin.

The symptoms of a contusion, or bruise, are familiar to everyone. There is immediate pain when the blow is received. Swelling occurs because blood from the broken blood vessels oozes into the soft tissues under the skin. At first the injured place is reddened, due to local skin irritation from the blow; later the characteristic "black and blue" marks appear; and finally, perhaps several days later, the skin is yellowish or greenish in color. The bruised area is usually very tender.

Treatment.—As a rule, slight bruises do not require treatment. However, if the victim has severe bruises, treat him for shock.

Immobilize the injured part. Keep it at rest, and protect it from further injury. Sometimes the victim will be more comfortable if the bruised area is bandaged firmly with an elastic or gauze bandage.

If possible, elevate the injured part. A sling may be used for a bruised arm or hand. Pillows or folded blankets may be used to elevate a bruised leg.

Apply COLD cloths or an ice bag to a fresh bruise.

CAUTION: Extensive bruises may be very serious. In such cases, always get medical attention for the victim as soon as possible.

SUMMARY

Any number of accidents may cause injury to bones, joints, and muscles. Of the various

7917

types of injuries that may occur, fractures are the most serious. A fracture is a broken bone, but the break need not be complete. A simple fracture is one in which the skin is unbroken; a compound fracture is one that breaks the skin causing an open wound.

Most fractures should receive the same general treatment—control hemorrhage, splint the injured part, and treat for shock. If the fracture is compound, hemorrhage should be controlled before splinting. Splints should be strong, well-padded, and of the recommended length. Splints may be applied over clothing, if medical assistance will be available soon. Splints should not be applied so snugly that they interfere with blood circulation. In treating for shock, keep the injured person lying down, in the position recommended for the particular type of injury. Morphine may be given for severe pain, except when the type of injury or other considerations prohibit its use. As all fractures are serious, they must be treated by a medical officer as soon as possible.

In giving first aid treatment for fractures, do not move the injured person until the fracture is splinted. Handle him gently as simple fractures are easily converted to compound fractures. Do not attempt to locate a fracture by grating broken ends of bones. Do not try to set broken bones. Make no attempt to straighten the injured part, except when the long bone in the arm or leg is fractured. Never attempt to force the end of a broken bone back into a wound. Use extreme care in transporting the injured person.

Certain fractures require special care in treatment. Skull fractures, spinal fractures, and pelvic fractures should be treated with extreme care to prevent permanent injury or death. Injuries of this type are so serious that you should be absolutely sure of what you are doing before you proceed.

A person with a fractured skull should never be given morphine. Do not allow him to sit or stand; keep him lying down. If his face is flushed, raise his head and shoulders slightly; if pale, keep his head level with, or slightly lower than, his body. Do not give a person with a fractured skull anything to drink.

For a fractured spine, do not move the injured person unless it is absolutely necessary. Never bend or twist his body or move his head. Do not attempt to keep him in the position ordinarily used for treating shock; keep him lying flat.

When a person with a fractured spine must be transported, fasten him securely to a rigid stretcher or support. If the casualty's neck is broken, transport him lying on his back, face up. Immobilize his head with pillows, sandbags, or other means so that it will not turn. Do not put padding under his head or neck. If the casualty's back is broken, transport him lying face down. However, if he must be transported a long distance, have him lie on his back, face up. Put padding under the small of his back. If you suspect a spinal fracture but cannot determine the location of the break, treat the injured person as though he had a broken neck; if both the neck and back are broken, treat him as though he had a broken neck.

When the pelvis is fractured, do not move the injured person unless it is absolutely necessary. Do not attempt to move him into the position ordinarily used for treating shock. Keep him lying on his back with his legs straight or drawn up, whichever is more comfortable. Immobilize the casualty as soon as possible. Bandage his legs together at the ankle and at the knees. Place pillows beside each hip, and fasten them in place with bandages or strips of cloth. Fasten the casualty securely to a rigid stretcher.

Injuries to joints and muscles may be classified as dislocations, sprains, strains, and contusions.

A dislocation is an injury in which a bone is forcibly displaced from its joint, and is likely to bruise or tear the surrounding tissues. As a general rule, you should not attempt to put a dislocated bone back in place. Place the injured person in a comfortable position, loosen the clothes around the injured part, support the injured part, and treat for shock.

A sprain is an injury to the ligament that supports a joint, and usually involves a momentary dislocation, with the bone slipping back into place of its own accord. As it is difficult to tell the difference between a sprain and a fracture, treat the injury as a fracture. Immobilize the injured joint and elevate the injured part, if possible. Apply cold cloths or an ice bag to the injured joint.

Strains are caused by the forcible overstretching or tearing of a muscle or tendon. Lameness or stiffness usually results, with moderate swelling and discoloration. Rest and, if possible, elevate the injured part. Apply cold

7918

to the area by means of cold compresses or an ice bag.

Contusions are caused by blows that damage bones, muscles, tendons, blood vessels, and other body tissues. Treat the injured person for shock; immobilize and, if possible, elevate the injured part; and apply cold compresses or an ice bag.

7919 0S01

CHAPTER 8

INJURIES FROM HEAT AND COLD

Exposure to extremes of temperature—whether of heat or of cold—causes injury to skin, tissues, blood vessels, vital organs, and in some cases to the entire body. In this chapter we will take up the injuries which are caused by extremes of heat or cold, the first aid treatment which should be given for them, and some of the preventive measures which may be taken to avoid them.

HEAT INJURIES

Burns, heatstroke, heat exhaustion, and heat cramps are the injuries most commonly caused by exposure to extreme heat. "Burns" caused by contact with acids, alkalis, and other chemcals, are not, for the most part, true heat burns; however, they will be discussed here because many people think of them as burns and do not realize that they require special treatment.

Burns and Scalds

Burns and scalds are caused by exposure to intense heat, such as that generated by fire, bomb flash, sunlight, hot solids, hot gases, and hot liquids. Contact with electric current also causes burns, particularly if the skin is dry. (Dry skin offers about 20 times more resistance than moist skin to the passage of electric current; when the skin is dry, therefore, the local heating effects (burns) are greater, even though the total damage to the body is less than when the skin is wet.)

It should be noted that burns and scalds are essentially the same type of heat injury. When the injury is caused by dry heat, it is called a burn; when caused by moist heat, it is called a scald. Treatment is the same in both cases.

Classification of Burns.—Burns are classified in several ways—by the extent of the burned surface, by the depth of the burn, and by the cause of the burn. Of these, the extent of body surface burned is the most important factor in determining the seriousness of the burn and plays the greatest role in the casualty's chances for survival.

In calculating the extent of burned surface, the RULE OF NINES is used (fig. 8-1). These figures aid in determining the correct treatment for the burned person. Shock can be expected in adults with burns of over 15 percent or small children with burns of over 10 percent of body surface area. In adults, burns involving more than 20 percent endanger life, and 30 percent burns are usually fatal if adequate medical treatment is not received.

The depth of injury to the tissues is spoken of in degrees. FIRST DEGREE burns are the mildest, producing redness, increased warmth, tenderness, and mild pain. SECOND DEGREE burns redden and blister the skin and are characterized by severe pain. THIRD DEGREE burns destroy the skin and may destroy muscle tissue and bone in severe cases. Severe pain may be absent because nerve endings have been destroyed. The color may vary from white and lifeless (scalds) to black (charred from gasoline explosions). Figure 8-2 shows the appearance of first, second, and third degree burns.

It is important to remember that the size of the burned area may be far more important than the depth of the burn. A first degree or second degree burn that covers a very large area of the body is almost always more serious than a small third degree burn. A first degree sunburn, for example, can cause death if a very large area of the body is burned.

The causes of burns are generally classified as thermal (heat) or chemical, or as resulting from sunburn, electric shock, or radiation. Whatever the cause of the burn, shock always results if the burns are extensive.

7920 68

136.31

Figure 8-1.—Rule of Nines for estimating percentage of burned area.

136.32

Figure 8-2.—First, second, and third degree burns.

Treatment of Burns and Scalds

First aid for all burns involves the following main items:

1. Relieve pain.
2. Prevent or treat shock.
3. Prevent infection.

In electric shock, the burn may have to be temporarily ignored while resuscitative measures are carried out. (See Ch. 3, Asphyxiation.) Otherwise the treatment is the same as for heat burns. Also, local treatment for chemical burns varies, depending on the agent that caused the burns. Chemical burns are discussed more fully later in this chapter.

Ice Water Treatment.—It is recognized that clean water and ice are not always available, but when they are, as an emergency measure, ice water provides immediate relief from pain and also seems to lessen the damaging effects of burns. For burns involving less than 20 percent of the body, immerse the burned part in ice water or, where immersion is not practical, apply ice-cold moist towels repeatedly to the burned area. The treatment should be continued until no pain is felt when the burned area is withdrawn from the water. This may take from 30 minutes to as long as 5 hours. When available, hexachlorophene should be added to the water to destroy bacteria. After the ice water treatment, the regular treatment for burns should follow (see below).

Relief of Pain.—Simple, first degree burns that do not cover a large body area may require no more than one or two aspirin tablets to relieve discomfort. Severe burns cause extreme pain, and the pain contributes to the severity of shock. A person who has suffered extensive burns may be given not more than 1/4 grain of

SECRET 7921

morphine to relieve the pain. The injection site should be massaged for a few minutes to help circulate the morphine. (See ch. 4, "Morphine Administration".)

CAUTION: The casualty may have other injuries. Do not give morphine to any person who has a head injury, chest injury, or who is in deep shock, even if he is suffering from extensive burns.

Treat for Shock.—Any person who has been seriously burned must be treated for shock immediately. Serious shock always accompanies an extensive burn, and is, in fact, the most dangerous consequence of the injury. Start the treatment for shock before making any attempt to treat the burn itself.

Relieving the casualty's pain is, of course, an important part of the treatment for shock. After this has been done, place him in a position so that his head is lower than his feet. Make sure that he is warm enough; do not remove his clothing immediately. Remember that exposure to cold will cause shock to become worse, but do not overheat him.

As mentioned in chapter 4, a seriously burned person has an overwhelming need for liquids; and the administration of liquids in such cases is an important part of the treatment for shock. Give small amounts of sweet tea, fruit juice, or sugar water, if the casualty is conscious and able to swallow and has no internal injuries.

Prevention of Infection.—Second and third degree burns are, in effect, open wounds and must be covered to reduce the possibility of infection. Every effort must be made to use a sterile covering, but makeshift wrappings such as sheets and freshly laundered towels may be used.

OINTMENTS AND OTHER MEDICINES SHOULD NOT BE PUT ON THE BURN WOUND. Using these agents may make later treatment by a physician difficult or impossible.

Do not allow unsterile objects or materials to come in contact with the burn wound. Do not open any blisters. Do not cough or sneeze near the casualty, and if possible, keep a piece of sterile gauze over your mouth and nose while you are working near the burn. Contamination by micro-organisms from the mouth and nose is a frequent cause of serious (and possibly fatal) burn infections.

Treatment.—If the casualty is to receive medical attention soon, do nothing more than relieve the pain, treat for shock, and cover the burn with a sterile wrapping or clean sheet or towel. DO NOT ATTEMPT TREATMENT OF THE BURN WOUND ITSELF.

If more than 3 hours will elapse before the services of a physician will be obtained, you should dress the burn. First remove the casualty's clothing from around and over the burned area, preferably by cutting it away. Be very careful not to cause further injury. If clothing sticks to the burn wound, DO NOT ATTEMPT TO PULL IT LOOSE. Merely cut around the part that sticks, and leave it in place. If any material such as wax, metal, dirt, grease, or tar sticks firmly to the burn, do not try to remove it. Do not allow absorbent cotton, powder, adhesive tape, or other substances that might stick to the burn to come in contact with the burn. Never put iodine or any other antiseptic on a burn.

When you have cleared away as much of the clothing as you can, you should dress the burn. Apply a single layer of sterile, fine-mesh petrolatum gauze over the burn wound, beginning at the outside of the burn wound and working toward the center in a circular manner. Next place bulky fluffs of gauze over the burn, with a large padded dressing as the outer layer. Wrap gauze strips smoothly and gently around the dressing. The bandage should give light even pressure and immobilize the injured part. Once the bandage has been applied, IT SHOULD BE LEFT ALONE. Leave it in place until the casualty receives medical care.

Burns of the Eye.—Burns of the eye require special attention. If they are true heat burns, caused by exposure to steam, bomb flash, welding arc, or any other source of intense heat, treat them as follows:

1. Put a few drops of clean mineral oil or olive oil into each eye.
2. Cover each eye with a small, thick compress, and fasten the compress in place with a bandage or an eyeshield.
3. Make sure that the casualty does not rub his eyes.
4. Get medical attention for the casualty as soon as possible.

Chemical Burns

When acids, alkalies, or other chemicals come in contact with the skin or other body

1:ef 7922

membranes, they may cause injuries which are generally referred to as CHEMICAL BURNS. For the most part, these injuries are not caused by heat but by direct chemical destruction of the body tissues. Chemicals which often cause this kind of injury are acids, such as nitric acid, sulphuric acid, hydrochloric acid, etc., and CAUSTIC ALKALIES, such as potassium hydroxide (lye), sodium hydroxide (caustic soda, soda lye), and calcium oxide (quicklime). PHENOL, commonly called CARBOLIC ACID, also causes chemical burns. Strong concentrations of various bleaches and disinfectants cause chemical injuries to the skin. CHLORINE, AMMONIA, and other industrial gases (whether in liquid or vapor form) may cause serious chemical burns of the skin or of the eyes. WHITE PHOSPHOROUS, one of the substances used to develop screening smokes, causes a burn which is a combination of a true heat burn and a chemical injury.

First aid treatment for chemical burns consists of the following measures:

1. WASH OFF THE CHEMICAL WHICH IS CAUSING THE INJURY! This must be done IMMEDIATELY. Flood the affected areas with large amounts of water—preferably water which is clean, fresh, and cool. The best way to get rid of the chemical is to put the casualty under a shower and let the water run as long as necessary.

In order to make the washing process effective, you will of course have to remove all clothing which has come in contact with the chemical. Strip it off as quickly as possible; or, if shears are available, cut it off.

If it is not possible to put the casualty under running water, immerse the affected areas in the largest available amount of water, or pour great quantities of water over him.

It is important to use a large quantity of water, so that the chemical will be diluted and weakened; but you should not apply it forcefully. The skin and tissues which are injured by the action of the chemical will suffer additional damage if the water is applied with too much force.

2. Neutralize any chemical which remains on the skin, by the following applications: for ACID burns, apply a solution of sodium bicarbonate (baking soda) or some other mild alkali; for ALKALI burns, apply vinegar, lemon juice, or some other mild acid; and for PHENOL (carbolic acid) burns, wash the skin with alcohol. DO NOT ATTEMPT TO NEUTRALIZE ANY CHEMICAL UNLESS YOU ARE SURE THAT YOU KNOW WHAT IT IS AND WHAT SUBSTANCE WILL EFFECTIVELY NEUTRALIZE IT!

3. Wash the affected areas again with fresh water, and dry gently with sterile gauze. Be careful that you do not break the skin or open any blisters. Take all possible precautions to avoid infection.

4. Do whatever you can to relieve the casualty's pain and to treat him for shock. Extensive chemical burns, like extensive heat burns, cause extreme pain and shock.

From this point on, it is usually safe to treat a chemical burn as though it were a true burn, except that petrolatum gauze should not be applied unless you are certain all of the chemical has been removed. Get medical attention for the casualty as soon as possible.

Chemical Burns of the Eye.—Chemical burns of the eye should be treated as follows:

1. Flush the eye IMMEDIATELY with large quantities of fresh, clean water. A drinking fountain may be used to supply a steady stream of water; hold the casualty's head in position so that the water flows from the INSIDE corner of his eye toward the OUTSIDE corner. Do NOT let the water fall directly on the eyeball, and do NOT use any greater force than is necessary to keep the water flowing across the eye.

If you are not near a drinking fountain, have the casualty lie down with his head turned slightly to one side; then pour water into the INSIDE corner of his eye and let it flow across the eyeball to the OUTSIDE corner. Remember that the water must not fall directly upon the eyeball, and that it must not be poured with any greater force than is necessary to sustain the flow across the eyeball.

> NOTE: Because of the intense pain, the casualty may be unable to open his eyes. If this occurs, you must hold the eyelids apart so that the water can flow across the eyeball.

Another way to wash chemical substances from the eye is to have the casualty open and close his eyes several times while his face is immersed in a pan or bucket of fresh water.

2. Cover the eye with a small, thick compress; fasten the compress in place with a bandage or an eyeshield.

3. Get medical care for the casualty as soon as possible.

7923
ASER

CAUTION: Do not use anything except water in treating chemical burns of the eye. Do not attempt to neutralize the chemical which has caused the injury. Do not apply any ointment, grease, oil, or salve.

Heatstroke

Exposure to excessive heat may result in either heatstroke or heat exhaustion. Heatstroke and heat exhaustion are caused by the same external conditions—desert or jungle heat, exposure to direct rays of the sun, or heat of machinery spaces, foundries, bakeries, etc. Under similar circumstances, one person may develop heatstroke and another heat exhaustion.

Although the external cause of the two injuries is the same, there are important differences between them which must be clearly understood. Each condition represents a DIFFERENT bodily reaction to excessive heat, and for this reason the symptoms and treatment are also different.

HEATSTROKE (sometimes called SUNSTROKE) is a very serious condition which results from a failure of the heat-regulating mechanism of the body. The body becomes overheated, the temperature rises to between 105° and 110° F, but there is no sweating and therefore no cooling of the body. As you would expect, the casualty's skin is hot, dry, and red. Sometimes the casualty may have preliminary symptoms such as headache, nausea, dizziness, or weakness; but very often the first signs are sudden collapse and loss of consciousness. Breathing is likely to be deep and rapid. The pulse is strong and fast. Convulsions may occur. Heatstroke may cause death or permanent disability; at best, recovery is likely to be slow and complicated by relapses.

The longer the casualty remains overheated, the more likely he is to die. Therefore, all first aid measures are aimed at lowering the casualty's body temperature. The following steps should be taken:

1. Remove the casualty to the coolest possible place.
2. Take off the casualty's clothing.
3. Place him so that he is lying on his back, with his head and shoulders SLIGHTLY RAISED.
4. Cool the casualty. Sponge or spray his body with cold water, and then fan him so that the water will evaporate rapidly.
5. If the casualty regains consciousness, give him cool (but not cold) water to drink. DO NOT GIVE ANY STIMULANTS OR HOT DRINKS!
6. Get the casualty to a hospital or under the care of a medical officer as soon as possible. Cooling measures must be continued while the victim is being transported.

Heat Exhaustion and Heat Cramps

As we have seen, heatstroke is a condition in which the body becomes overheated because the heat-regulating mechanism fails to function. In HEAT EXHAUSTION, the bodily reaction to excessive heat is very different. There is no failure of the heat-regulating mechanism, but there is a serious disturbance of the blood flow, similar to the circulatory disturbance of shock. Through prolonged sweating, the body loses large quantities of salt and water; it is believed that this loss is responsible for the circulatory disturbance which occurs in heat exhaustion.

Heat exhaustion may begin with headache, dizziness, nausea, weakness, and profuse sweating. The casualty may collapse and lose consciousness, but he can usually be aroused rather easily. The body temperature is usually normal or even below normal; sometimes it may go down as low as 97° F. As in shock, the pupils of the eyes are usually dilated (enlarged); the pulse is weak and rapid; and the skin is pale, cool, and sweaty. Heat exhaustion is sometimes—although not always—accompanied by severe cramps in the muscles of the abdomen, legs, and arms. These cramps, known as HEAT CRAMPS, may also occur separately, without any other signs of heat exhaustion. Loss of salt is probably the basic cause of heat cramps.

First aid treatment for heat exhaustion is very much like first aid treatment for shock. The following measures should be taken:

1. Remove the casualty to a cool place, but be careful that you do not put him where he will be exposed to strong drafts or where he might become chilled.

2. Loosen his clothing and make him as comfortable as possible. Keep him quiet.

3. Keep the casualty lying down, with his feet and legs somewhat elevated. Be sure that he is kept comfortably warm. You may have to cover him with blankets, even if the air around him is quite warm.

NATIONAL BUREAU OF STANDARDS-1963-A

4. If the casualty is suffering from severe heat cramps, the pain may be relieved by the application of heat to the affected muscles or by firm pressure of the hand against the muscles. If the cramps are exceedingly painful, it may be necessary to give morphine.

5. If the casualty is conscious and able to swallow, give him plenty of warm water to drink, adding 1/4 to 1/2 teaspoonful of salt to each glass. Note that this is probably the most important part of the treatment for most cases of heat exhaustion. Replacement of the salt and water which has been lost by sweating often brings about a rapid recovery.

6. Give the casualty hot coffee or hot tea; the caffeine contained in both coffee and tea stimulates the heart and thus decreases the circulatory disturbance.

7. If the casualty does not recover promptly, get medical attention for him as soon as possible.

PREVENTION of heat exhaustion and heat cramps may be accomplished by increasing the consumption of salt and water. All persons who are required to live or work in excessively hot places should add about one teaspoonful of salt (or two 10-grain salt tablets) to each quart of drinking water. It is better to dissolve the salt in the drinking water than to take salt tablets undissolved, since salt taken in concentrated form may cause nausea, vomiting, and diarrhea.

COLD INJURIES

Cold injury may be defined simply as tissue injury caused by exposure to cold. Traditionally, cold injuries are categorized as chilblains, immersion foot, trenchfoot, and frostbite (in order of ascending severity). However, these categories serve little purpose other than to describe the manner in which the injuries were acquired. Basically, there are two types of cold injuries—FREEZING and NONFREEZING. But, it is seldom that the injury will be totally of one type, with none of the other. Rather, a cold injury may range from frostbite of the exposed part to lesser degrees of nonfreezing as progress is made to less exposed parts.

General Precautions

The following factors are important in the treatment of all cold injuries:

- Cold injury should never be treated lightly because of the possibility of tissue loss and nerve damage. If a cold injury is suspected, the casualty should not be permitted to perform his regular duties until the severity of his injury can be determined.
- It is essential to get the casualty into a warm place as soon as possible. It is nearly impossible to give effective first aid treatment for cold injuries while the casualty remains exposed to cold.
- It may be necessary to treat other injuries BEFORE the casualty can be moved to a warmer place. Severe bleeding must be controlled, breathing must be restored if necessary, and fractures must be splinted (over clothing) before the casualty is moved. Treat the casualty for shock, insofar as possible.
- If it is necessary to give morphine for relief of severe pain, do not give more than the recommended dosage (see ch.4). The cold slows up the circulation of the blood, delaying absorption of the morphine. Massage the injection site repeatedly to hasten absorption of the morphine. Do not give a second injection in less than 4 hours.

Finding a place to inject morphine may be difficult if the casualty is wearing heavy clothing. The most accessible place where it is permissible to give morphine is likely to be at the muscular area at the base of the neck. Do not remove any more clothing than is necessary.

NOTE: In very cold weather, the morphine syrettes must be carried close to the body so that they will not freeze.

Treatment

First aid measures for cold injuries consist, in general, of giving mild stimulants such as tea or coffee, exercising care not to injure skin deadened by the cold when removing constrictive clothing, and exercising great care to prevent infection. Blisters should not be broken. Alcohol and tobacco are prohibited. Snow, ice water, grease, massage, or dry heat should not be applied to the affected parts. If the part has been frozen, it should be rapidly rewarmed in a controlled temperature bath.

Chilblains.—Chilblains (Pernio) are a mild cold injury caused by repeated exposure for several hours at a time to temperatures between 32° and 60° F. It is generally associated with high humidity.

Chilblains is characterized by redness and swelling; itching, burning skin inflammation;

7925

tingling and later a deep-seated ache. Very mild cold injuries such as chilblains require little in the way of specific treatment, except to warm the injured part and keep it dry. However, because of the difficulty of determining tissue damage accurately, care must be taken not to underestimate the cold injury. Get medical assistance as soon as possible.

Nonfreezing Injuries.—Nonfreezing injuries such as immersion foot and trenchfoot, although having different causes, have similar symptoms and should, in general, receive the same treatment.

Immersion foot is caused by exposure to cold water (50° F and below) for 12 hours or more; or to water of approximately 70° F for several days. Trenchfoot is caused by exposure to cold (32° F to 50° F), damp weather for a period of several hours to 14 days (average, 3 days). Inability to move about freely because of local conditions or wounds is also a contributing factor. These injuries are characterized by tingling and numbness; swelling legs and feet; bluish discoloration of the skin; blisters; and pain.

In treating nonfreezing injuries, get the casualty off his feet as soon as possible. Expose the affected parts to air; warm, dry air is the most beneficial. Blisters should not be ruptured, and salves and ointments should not be used. If the skin is not broken and loose, the injured part may be left exposed; however, if it is necessary to transport the casualty, the injured part should be covered with loosely wrapped, fluff bandages of sterile gauze.

When the skin is broken and tissue is loose, the extremity should be placed on a sterile sheet and covered with a sterile sheet draped over the injured extremity to protect the sensitive tissue from pressure and infection.

Freezing Injuries.—Frostbite is caused by brief exposure to extreme cold (-20° F and below), or exposure to near zero weather for several hours. At temperatures of -20° F to -60° F and below, exposed fingers and toes may rapidly become frozen, with the freezing extending up the arms and legs as exposure is prolonged.

The symptoms at first are burning, stinging, then numbness. Ice crystals in the skin cause a gray or white waxy color, but the skin will move over bony ridges. When the part is completely frozen, there are ice crystals in the entire thickness of the extremity, indicated by a pale, yellow, waxy color. The skin will not move over bony ridges. When the frozen part is thawed, it becomes red and swollen and large blisters develop.

The frostbitten or frozen extremity should be rapidly thawed in a water bath of 107° F to 109° F, provided the part is not going to be subjected to extreme cold again. (Refreezing a thawed extremity seals its fate. It is better to leave the part frozen until the casualty arrives at an installation equipped to care for it than to take a chance on its being refrozen.) If you have no thermometer with which to check the temperature, make sure that the water is comfortably warm. Warming should not continue beyond the time when thawing is complete. After warming, dry the casualty carefully. Place him in bed and keep him covered, with sterile sheets, if possible, but do not let the covers come in contact with the frostbitten parts. Keep the frostbitten parts dry. Sterile gauze or cloth pads should be placed between the toes or between the fingers. If possible, keep the frostbitten part slightly elevated.

All casualties whose legs or feet have been frostbitten or frozen must be treated as litter patients. No walking should be permitted.

The rapid thawing of a frostbitten or frozen extremity may cause intense pain. Morphine may be given if the casualty has no head injury, no chest injury, and is conscious. Do not give more than the recommended dosage.

Chemical "Burns".—Frostbite may be caused by contact with certain chemicals that have a rapid freezing action. Some of these chemicals such as liquid oxygen, carbon dioxide, Freon, and other industrial gases are widely used in the Navy. Although injuries caused by contact with these substances are often referred to as chemical "burns," the body tissue is actually frozen rather than burned.

Cold injuries caused by contact with chemicals tend to be superficial and, as a rule, not very serious—UNLESS the chemical comes in contact with the eyes. If the eye tissues are frozen, permanent impairment of vision may result. Any person who must work around Freon, methyl chloride, or other refrigerants must be particularly careful to protect his eyes. Safety goggles are provided for use in case of refrigeration system leakage. If any of these rapid-freezing chemicals come in contact with the eyes, get medical help for the person at

once. In the meantime, put drops of clean olive oil or mineral oil in the eyes and make sure that the casualty does not rub his eyes.

General Loss of Body Heat

The abnormal lowering of general body temperature is usually brought about by total immersion in cold water and by loss of consciousness (perhaps through injury, coma, or alcoholism) in winter weather with prolonged exposure without adequate clothing. The person appears pale and unconscious and may be taken for dead. Breathing is slow and shallow, and the pulse faint or unobtainable. Body tissues feel semirigid, and the extremities may be stiff.

First aid treatment consists mainly of bringing the body temperature to normal. This should be done by wrapping the person in warm blankets and placing him in a warm room. Hot drinks, massage, and other stimulants should not be given until after the person has regained consciousness. Get medical assistance as soon as possible.

SUMMARY

When exposed to extremes of temperature, the body may be seriously injured.

Extreme heat may cause burns, heatstroke, heat exhaustion, and heat cramps. Of these, only burns cause skin and tissue damage, and the extent of burned surface is the most important consideration in determining the seriousness of the burn. In treating burns, the main tasks are to relieve pain, prevent or treat shock, and prevent infection. As a rule, ointments, salves, and other medications should not be applied to the burned surface.

Heatstroke, heat exhaustion, and heat cramps may be classed as heat emergencies, of which heatstroke is the most serious. In treating heatstroke, characterized by hot, dry skin, all first aid measures must be aimed at lowering the casualty's body temperature. As recovery from heatstroke may be long and difficult, always get the casualty under medical care as soon as possible.

Heat exhaustion and heat cramps are caused by the loss of body salt and water due to profuse sweating. Recovery is generally rapid once salt and water are replaced.

Cold injuries are of two general types—freezing and nonfreezing. First aid measures generally consist of giving mild stimulants, preventing injury to deadened tissues, and preventing infection. Blisters should not be broken, nor should salves or ointments be used. If the injured part has been frozen, it should be rapidly thawed in a controlled temperature bath, if it is certain that the part will not be subjected to refreezing. As it is difficult to determine the extent of tissue damage in cold injuries, always get medical assistance as soon as possible.

CHAPTER 9

DEFENSE AGAINST NBC AGENTS

It is common knowledge that any poison that gets into your body may result in sickness or death. When NBC (nuclear, biological, chemical) warfare agents are used, poisons are released and casualties are almost certain.

The purpose of NBC warfare is to produce casualties; it merits your respect. The agents used in NBC warfare may be strange to you, but means by which casualties are brought about are familiar enough.

Results similar to those occurring from chemical warfare (also called CW or gas warfare) can be seen in everyday events. Many automobile drivers have died from the effects of carbon monoxide gas. Firemen, also, have been overcome by deadly fumes. You have probably used chemicals such as fly spray to kill flies. The chemicals used in CW are more deadly and cover larger areas than fly spray—and they are aimed at you.

Next, consider biological warfare (called BW or germ warfare). A few harmful germs or organisms are present in everyday living and result in disease like colds or diarrhea. Most contagious diseases such as measles, mumps, chicken pox are due to certain germs getting into the body. Although only a small percentage of germs are so deadly that they can result in death, you may have had friends or relatives who got such germs and died. Germ warfare is a man-made attempt to use germs to produce disease or death in man, animals, and plants.

Finally, certain aspects of nuclear warfare (NW) are not new to you. The painful results of overexposure to strong sunrays are a common experience. Taking X-ray pictures or X-ray treatments must be carefully controlled. In the wrong hands X-ray machines can be very dangerous and can cause severe sickness or death. Any ray that is powerful enough to penetrate your skin and damage your body cells merits respect. In a nuclear explosion radiation is present in dangerous amounts, although the heat and blast present are much more deadly.

In brief, NBC agents are poisons in the form of gases, liquids, smokes, germs or germ products, and radioactive materials used in warfare to produce death, injury, or discomfort.

CHEMICAL AGENTS: WAR GASES

War gases are toxic (poisonous) chemicals which can produce death, injury, or irritating effects. Although commonly called gases, actually these agents may be found as solid particles, liquids, or gases.

War gases attack the body and produce specific damages according to the nature of the gas used. Shown below is a simple breakdown of the most common types:

1. Nerve gases
2. Blister gases
3. Psycho gases
4. Blood gases
5. Choking gases
6. Vomiting and tear gases

Nerve Gases

Of great importance because of their ACTION on your NERVOUS SYSTEM is a group of gases called "G-GASES." We will refer to them simply as nerve gases. They are quick killers. Very small amounts result in dimmed vision, headache, dizziness, and nausea. Upon entering your body through the nose, skin, or mouth, nerve gases interfere with breathing and may cause convulsions, paralysis, and death. The first effects are usually headache, difficulty in vision, and contraction of the eye pupils to pinpoint size. These effects are usually followed by a running nose, nausea, stomach cramps, rapid breathing, tightness of the chest, twitching muscles, and cessation of breathing. This is the most important group of killer gases.

1 7928

Right here it must be stressed that PROTECTION AGAINST NERVE GASES requires FOUR ACTIONS:

1. Speed in detection
2. Speed in giving the alarm
3. Speed in masking
4. Speed in self-aid and first aid

Blister Gases

As the name tells you, blister gases cause blisters on your skin. The result can be far worse than a severe case of sunburn. In either liquid or vapor form, these agents irritate and blister any part of your body that they touch. Blister gases can be effective in small amounts. A drop the size of a pinhead will produce a blister the size of a quarter. Blister gases are more effective in hot weather than in cold weather. They first affect the moist parts of the body (bend of arms and knees, armpits, and crotch). Men who are sweating are especially subject to severe burns. Blister gases are quick-acting, but their quick action is not apparent at first. If you are exposed to blister gas, nothing will happen immediately. One to several hours will go by before your skin starts to turn red. It will be hours or even days later before the blisters appear. However, the damage is done during the first few minutes of exposure. That is the reason why speed (stressed later in the section on self-aid) is so all-important.

Damage to the eyes may be worse than the effects on the skin. Gases—even liquids—may irritate the eyes only mildly at first, or there may be no pain at all. In a few hours, however, your eyes will smart, become inflamed, and be sensitive to light. Tears and great pain will follow, and permanent injury may result. Some blister gases will cause the eyes immediate pain.

If breathed into your lungs, blister gases will inflame the throat and windpipe and produce a harsh cough. In serious exposure this may result in pneumonia and death. Quick detection of blister gases plus prompt protection against entry into the eyes, lungs, or skin is vital in order to escape harm.

Psycho Gases

Psycho gases are something like marijuana—they produce mental symptoms and may also produce physical symptoms such as staggering gait, dizziness, and blurred vision. Some cause fainting spells, and some cause severe muscle weakness. The mental symptoms often resemble alcoholic drunkenness—men may act silly, giggle, or become angry and belligerent like a "fighting drunk." Sometimes psycho agents cause hallucinations. (Like alcoholic "DT's," victims may imagine they see snakes or enemy soldiers or imagine that colors have changed—some men think that trees are orange instead of green.) Many of these psycho gases prevent sleep, like benzedrine pills ("goof balls"). Some people may stay wide awake for 4 days and be mentally confused for the whole period. These gases are nonkillers and may become widely used. They do not kill but they make a man noneffective. Many of them do not produce effects until several hours after inhalation. These effects last from 8 hours to 4 days.

Blood Gases

Blood gases get their name because of the action they have on your blood. If you inhale blood gas, the blood cannot furnish oxygen to the body cells. As a result, the body tissues suffocate and die. Rapid breathing followed by violent convulsions are the main symptoms when a large amount of blood gas is inhaled. A mild exposure may produce headache, dizziness, and nausea. Blood gases either will cause a speedy death or complete recovery will take place within a few hours. Like nerve gases, blood gases are quick killers; therefore speed in masking is essential. Although they are cheap to make, it is very hard to build up effective concentrations in the air. It is thought that most countries will discontinue stocking them.

Choking Gases

Your lungs are the target for choking gases. If you can avoid breathing these gases, you are safe inasmuch as they do not harm your skin or digestive system. Choking gases will actually choke an unprotected person. If large amounts enter the lungs, the lungs will become filled with liquid, and death may result from lack of oxygen. Your protective mask gives you complete protection against all choking gases. The INSTANT you suspect the presence of a war gas, carry

07829

out these THREE ACTIONS as quickly as possible:

1. Stop breathing.
2. Put on your protective mask.
3. Clear your mask.

Protective mask drill will make you letter-perfect in these steps.

Choking gases will probably also be discontinued by most countries because of the more effective nerve gases.

Vomiting and Tear Gases
(Riot Control Agents)

Vomiting and tear gases produce unpleasant symptoms, usually only for a short time, and do not cause death when properly used. They are used to control riots, to force people out of buildings or caves, and sometimes, to capture enemy forces without injury. They are often used for training.

Vomiting Gases.—Inhaling vomiting gases makes you sick. A sense of fullness in the nose, a severe headache, intense burning in the throat, and tightness and pain in the chest are the general symptoms. These are followed by uncontrollable coughing, violent sneezing, nausea, and finally vomiting.

Remember that symptoms may be delayed several minutes. If you should inhale vomiting gas before you get your protective mask on, you might get sick after your mask is on. It would be natural, then, to think that the mask is leaking and to take it off. If you do so, however, you will be exposed to more gas. This would be disastrous if vomiting gases were combined with nerve, blister, or blood gases. It is quite possible that the enemy might do just this. The result would kill or seriously injure the man who took his mask off because he was sick.

YOU MUST WEAR YOUR PROTECTIVE MASK AS LONG AS GAS IS PRESENT. PULL IT AWAY FROM THE CHIN (DON'T TAKE IT OFF) DURING THE ACTUAL VOMITING. The protective mask offers adequate protection against vomiting gases. The undisciplined man, feeling terribly sick, will remove his mask and die, if poison gases are also present. But the disciplined man, with as great an urge to take off his mask, will keep it on and live. Effects of vomiting gases usually wear off in 20 minutes to 2 hours.

No chemical—even common table salt—is completely safe, and some men were killed when vomiting gas was used (against regulations) in very high concentration inside a barracks. This gas is often used as a training gas, but should only be used outdoors.

Tear Gases.—Tear gases are the least toxic of the six groups of war gases. They are discussed in this manual because you will encounter them during your training. They may also be used in civil riots to disperse the crowds or to squelch prison riots. The vapors of tear gases produce sharp, irritating pain in the eyes, resulting in an abundant flow of tears. There is usually no permanent damage to the eyes, however, and the effects wear off quickly. For a short time, though, you may not be able to see. The protective mask, put on before tear gases get into your eyes, will give complete protection. One of the purposes of the gas chamber exercise is to prove to you how effectively your protective mask protects against gases which attack you through the nose, mouth, or eyes. Some of the new tear gases also cause a running nose, severe chest pains, and sometimes, vomiting. Like regular tear gas, these effects also wear off quickly.

Self-Aid

Self-aid—personal decontamination—is your responsibility. If battle conditions at the time of exposure require you to keep fighting, you will decontaminate as soon as possible. In battle, it will be a tragic error for you to wait for someone else to give you first aid. The need for speed requires you to be your own aidman.

Time Limits

Since there are definite time limits after which self-aid becomes useless, immediate self-aid or personal decontamination is all-important if you are exposed to war gas. Decontamination either by neutralizing (making the chemical agent harmless) or by removing the agent, or both, should be done before serious injury occurs. If you have been contaminated with liquid nerve gases or blister gases, you must perform several self-aid measures as rapidly as possible.

Speed is essential in self-aid, and because you may not know whether you have been contaminated with liquid nerve gas or liquid blister

7930

gas, the following standard procedures must be observed to prevent injury from liquid agents:

1. Decontaminate eyes and face if necessary.
2. Mask.
3. Rinse contaminated areas with water. (Removes nerve gases.)
4. Throw away contaminated clothing (or cut away the contaminated part).
5. Blot off remaining liquid agent.
6. Apply protective ointment. (Remove blister gases.)
7. ONLY if effects of nerve gases begin, use atropine injection device.

The self-aid procedure for specific gases is given in the following paragraphs, and should be employed if the agent has been identified.

Protective Kit

The protective ointment kit is issued for your use in applying self-aid to reduce or avoid injury from war gases. It contains the following items:

1. Three tubes of protective ointment
2. One or more atropine injectors
3. Absorbent cloth or paper

Directions for using these items are printed on the containers. A new impregnated pad has been developed to replace the ointment and is used like a blotter.

Self-Aid for Nerve Gases

Mask at once if you notice any of the following symptoms:

1. A faint, sweetish, fruity odor. (This will be very rare, as most nerve gases are odorless.)
2. The pupils of someone else's eyes shrinking to pinpoint size.
3. Your sight blurring or dimming.
4. A painful sensation in your eyes.
5. Tightness in your chest and difficulty in breathing.

If you are told that your pupils are getting very small, or if you are having trouble breathing and your chest feels tight, take the atopine injector from your protective ointment kit. The directions for use are as follows:

1. Unscrew needle cover and remove. Be careful not to lose the wire loop!
2. Keeping needle end up, push wire loop down firmly until inner seal breaks, then pull wire out.
3. Jab needle into muscle (thigh, arm, etc.).
4. Squeeze tube slowly from sealed end until empty.

CAUTION: For use ONLY in NERVE GAS poisoning.

Another type of injector (automatic) may be issued to you. Complete directions for its use will be included with the injector.

Tips on the use of the atropine injector:

1. Inject the needle into a large muscle in the thigh or upper arm.
2. Place point of needle against skin, and then with firm pressure force the needle through the skin into the muscle all the way. You will feel little pain, only a slight pricking sensation.
3. The needle may be injected through the clothing.

PRECAUTIONS in applying self-aid for the nerve gases:

1. Do not take an injection of atropine until you are SURE you NEED it. Pinpointing of the eye pupils or blurred vision along with a tightness in the chest and a hard time breathing are signs that you need it. If you get excited and inject atropine when you have not been exposed to nerve gas, you may become ill, particularly in very hot weather. This would be a real danger in combat. However, if you really do inhale some nerve gas, atropine counteracts it and will make you feel better.

2. If you have inhaled a really large dose of nerve gas vapor, you may need more than one injection of atropine to relieve your symptoms. If nerve agent symptoms persist, you may give yourself up to two more injections for a total of three. More than three injections may be given under supervision of Medical Personnel, if available, or under direction of your NCO or officer in charge.

3. If you get good relief from the atropine and can breathe freely again, carry on with your duties. DRYNESS OF THE MOUTH IS A GOOD SIGN. It means that you have had enough atropine to overcome the dangerous effects of the nerve gas.

4. If you should get a drop or splash of liquid nerve gas in your eye, INSTANT ACTION is necessary to avoid serious injury. Get some water as fast as possible, tilt your head back so that your eyes look straight upward, and slowly pour water into the contaminated eye to flush it out. Hold the eye open with the fingers, if necessary. Pour the water slowly so that the irrigation will last not

SECRET 7931

less than 30 seconds. This irrigation must be done in spite of the danger of breathing nerve gas vapor. Get your mask on quickly after completing the irrigation. Then if symptoms of nerve gases develop, give yourself atropine.

5. If liquid nerve gas gets on your skin or clothing, fast action is needed to get rid of it. Immediately flush the contaminated area with water. If there is no water, blot the liquid off your skin with one of the cloths from your protective ointment kit, your handkerchief, or a piece of cloth torn from your outer clothing. Do this by pinch-blotting in order not to spread the contamination. Next, quickly remove contaminated clothing. Blot off the contamination and decontaminate with soap and soapy water. Then carry on with your combat duties. Meanwhile, notice if there is any twitching of the muscles under the contaminated area. If none develops in the next half hour and you have no tightness in your chest, your decontamination was successful and you can forget it.

6. If twitching of the muscles under the area of contaminated skin does develop, do not wait for the appearance of other symptoms, but give yourself an injection of atropine AT ONCE. If no other symptoms develop, one injection of atropine is enough. The atropine does not relieve the local twitching of the muscles, but this twitching is not dangerous.

7. Avoid water and food that may be contaminated with nerve gases. Let the medics check food and water for safety before you use them. If you have swallowed contaminated food or water, and all of these symptoms occur—increased flow of saliva, nausea, pains in the stomach, and a tightness in the chest—take atropine.

First Aid for Nerve Gases

The most important things to do for a casualty who has been poisoned by nerve gas are:

1. If you suspect the gas is still present, put his mask on him.

2. Give him an atropine injection from his kit.

3. Give artificial respiration. Mouth-to-mouth is the best method, but if you are still masked, you must, of course, use another (manual) method. Some of the latest protective masks have a coupling and a hose so that you can connect up and give mouth-to-mouth artificial respiration while remaining masked.

4. Poisoning with nerve gases causes the mouth and throat to fill up with thick, sticky saliva. You may have to clear out the back part of the victim's mouth with a handkerchief, rag, or your fingers. Continue to check this as it may make artificial respiration difficult.

Many modern crop and garden sprays and bug killers are related to nerve gas. Every year many people are fatally poisoned from these chemicals. First aid is the same as for nerve gases.

Self-Aid for Blister Gases

Since mustard gas is a typical blister gas, knowledge of self-aid for mustard will be a basis for self-aid against all blister gases. For liquid mustard on the skin, take the following actions:

1. Blot it off, using a pinching motion to keep liquid from spreading.

2. Apply your protective ointment.

CAUTION: Do not apply protective ointment near the eyes.

3. Scrub your skin with soap and water followed by plenty of clear water. If there is no soap and water, blot off the first coat of protective ointment. When scrubbing, pay special attention to areas not covered by clothing (neck and ears), to the belt area, to hairy regions, and to the pubic (private) region.

4. Apply protective ointment again and let it remain.

For liquid mustard in the eyes, flush your eyes repeatedly with clear water.

For the Eyes.—If blister gas gets in your eyes, treat it instantly, as every second counts. THIS IS IMPORTANT. If there is no pain in your eyes, treat them with water only as described below. If there is pain in your eyes, flush eyes with water and seek medical aid immediately. If your eyes do hurt, a different type of blister gas is present, requiring immediate medical attention.

1. Flush the eye with water. The best way to do this is to tilt the head back so that the eyes look straight upward. Pull the lids apart with the fingers of one hand. With the other hand, pour water slowly into the eye. Try to regulate the flow of water so that the flushing lasts not less than 30 seconds and not more than 2 minutes.

2. SPEED in decontaminating the eye is ABSOLUTELY ESSENTIAL. Decontamination is very effective for mustard gas if applied within the first few seconds, but after 2 minutes it does very little good.

7932

For the Skin.—Pinch-blot liquid blister gas from the skin with the cloth that comes wrapped around the tube of protective ointment or with any other absorbent material at hand. Throw away the cloth or absorbent material used.

2. Break the tip off or tear off the bottom of a tube of protective ointment and apply ointment freely to the contaminated area. Rub it in well with the fingers and wipe off as much as can be removed readily with a fresh cloth or parts of the outer clothing. Apply a fresh layer of ointment and let it remain. An impregnated pad will soon replace the tube of ointment.

3. If the contamination is discovered late, when no liquid blister gas is visible and reddening of the skin has begun, wash contaminated area with soap and water. Protective ointment will not help at this stage; it will irritate the reddened skin.

4. Cut off hair which becomes contaminated with liquid blister gas. Decontaminate the exposed scalp with protective ointment, as described above.

5. Remove clothing which is contaminated with liquid blister gas. This applies to both ordinary clothing and to impregnated protective clothing. Decontaminate small areas with protective ointment or soap and water. It may be that the contamination is too great to handle with the equipment you have. In this case, cut out the contaminated parts or don't wear the clothes. When you are able, boil them with soap and water. This will make them safe to wear. The only exception to this is when the contaminating drops are very, very small (size of pinhead or smaller) and you are wearing both impregnated outer clothing and impregnated long underwear. The chemical in your impregnated clothes will take care of very small droplets.

Self Aid and First Aid for Psycho Gases

By the time a victim of psycho gas poisoning realizes something is wrong, he may be too confused mentally to do anything about it. He should be taken to a doctor immediately. If many people are affected, it may be necessary to confine them temporarily under guard to prevent accidents. They must not be allowed in critical or dangerous spaces until completely recovered as they are not responsible for their actions. Some of these gases prevent sweating and very much increase the danger of sunstroke on hot days.

There are effective antidotes for psycho gases, and one of these may be added to the self-aid kit in your protective mask carrier.

Self-Aid for Blood Gases

The first rule for the victim of blood gas is to get your mask on and avoid unnecessary movements. If you have received a large dose, you need an aidman. He will give you AMYL NITRITE to inhale and will administer artificial respiration if you need it. If blood gases are ever used again (unlikely), you may be issued amyl nitrite ampoules. In that event you can give the amyl nitrite to yourself. Just squeeze the ampoule until it pops. Insert two ampoules inside the facepiece of your mask under the eye lens. Repeat this at intervals of 3 or 4 minutes until normal breathing returns or until a total of eight ampoules are used.

Self-Aid for Choking Gases

Put on your protective mask IMMEDIATELY upon detecting any phosgene in the air. The odor is like new-mown hay or fresh-cut corn. Phosgene can also be detected by irritation of the eyes or by change in the taste of your cigarette (it may become tasteless or offensive in taste). Try not to breathe while masking. Even if you have inhaled some phosgene, continue with your combat duties. If, however, you have a very hard time breathing, feel nauseated, or vomit, take it easy. Avoid unnecessary movement.

Self-Aid for Vomiting Gases

Put on your protective mask and wear it in spite of coughing, sneezing, salivation, or nausea. Lift the mask from the face briefly, if necessary, to permit vomiting or to drain saliva from the facepiece. Clear your mask each time you adjust it to your face and before you resume breathing. CARRY ON YOUR DUTIES as VIGOROUSLY as possible; this will help LESSEN and SHORTEN the SYMPTOMS. Combat duties usually can be performed in spite of the effects of vomiting gases.

Self-Aid for Tear Gases

Put on your protective mask, cover the outlet valve, and blow hard to clear the mask. Keep your eyes open as much as possible. When vision

AC7933

clears, carry on your duties. When it is safe to remove your mask, blot away tears, but do not rub your eyes. If liquid or solid agent has entered your eye (rare occurrence), force your eye open and flush it with water.

DECONTAMINATION

Decontamination can be done by removing, neutralizing, or destroying the agent. The purpose of personal decontamination is to remove toxic agents from your body or personal equipment before serious injury occurs.

An example of REMOVING is pinch-blotting mustard gas from your skin.

Applying protective ointment to make the agent harmless is NEUTRALIZING.

DESTROYING is burning or burying a contaminated cloth which was used to blot off mustard gas.

Use Common Sense

Common sense and quick thinking play a big role in personal decontamination. You may have to rely on whatever you have on hand to remove war gases from your skin, eyes, or equipment. If liquid nerve or blister gases touch any part of your body, remove them as fast as you can. If you are caught without the best removers, like ointment or soap and water, then use anything that is available. It may be mud, gunoil, or even urine. A crude remover may get off only two-thirds of the agent, but it is better than nothing. You must keep in mind the fact that nerve and blister gases penetrate very fast. You CAN'T WAIT for help. GET THEM OFF!

Soap and Water

Always carry a bar of soap with you. Soap is excellent for removal of war gases. Cold water, while not as good as warm water, does dilute or weaken chemical agents. If plenty of cold water is available, it is very effective because you can pour it on for several minutes. Hot soapy water removes agents in a hurry. When you are removing any agent from your body with soap and water, scrub just as vigorously as a doctor scrubs his hands before an operation. Exposed regions and hairy regions should be given extra attention.

DEFENSE AGAINST BIOLOGICAL WARFARE

Biological warfare (BW) is the deliberate use of germs or their poisonous products to produce disease, injury, or death in man, animals, or plants. It is the intentional use of biological agents that makes BW new and dangerous.

You have been waging an individual fight against germs since you were born. The doctor who delivered you at birth made certain that your eyes were disinfected—free from dangerous germs. Your mother guarded you against disease by frequently bathing your body, sterilizing your milk bottle, and keeping you away from people with colds. Later you were vaccinated to protect you from smallpox. One of the first things you did on becoming a sailor was to take "shots" to protect you from diseases like typhoid fever. During World War II, naval personnel in tropical areas were careful to take atabrine to guard against malaria.

Any belief that biological warfare concerns a new or mysterious superweapon is NOT BASED ON FACT. Our fight against disease-producing germs has been going on for hundreds of years. BW is a manmade attempt to produce disease on a large scale.

Characteristics of BW Agents

Most germs are not harmful to man, animals, or plants. Many, in fact, are helpful. Yeast is used in the manufacture of bread and beer. Molds are used to ripen cheese. Only a few types of germs produce disease.

Since germs are alive, they behave as do other living things—they multiply, breathe, eat, grow, and die. They depend on moisture, food, and certain limits of temperature for life and growth. When their surroundings do not provide suitable conditions, they die. Most germs are killed by simple acts that you know about, such as boiling water, adding chlorine tablets to water, cooking food, exposure to sunlight, and use of soap and water.

How BW Agents Attack Your Body

BW agents or their poisonous products attack your body by the same routes as chemical agents—through your nose, mouth, or skin. Stop their entry into your body and you are safe from BW.

SEC934

Dangers of BW

In spite of the Navy's fine health program, BW does hold dangers that you must be prepared to meet. There is little to worry about from new kinds of diseases. The real danger to you is in new ways of spreading diseases already known.

When a person coughs or sneezes, tiny drops of moisture are blown from his mouth and nose into the air. If he is ill, the spray may carry harmful germs to others. Scientists working in laboratories have found that they are able to spread disease germs in much the same way—by floating the germs in fine sprays or mists called aerosols. Aerosols might be used for large BW attacks. They could be released from special sprayers carried by airplanes. When diseases are spread through the air in aerosols, anyone who breathes the mist is very likely to get a number of germs in his lungs. In that vital spot, germs can easily take hold and cause illness.

Protection Against BW

Defense against BW, like defense against CW, is neither simple nor easy. Individual protection against BW attack includes the use of protective equipment. Your protective equipment used for defense against gas warfare may be used for defense against BW. You will find that your first line of defense against BW is the natural resistance of your own body. Keep yourself in top physical condition. Every time you drill, engage in physical exercise or sports, hike, or eat good meals, you are preparing strong defenses against BW. A high standard of personal cleanliness and careful attention to sanitation are your best insurance against the spread of disease. Such steps are bolstered by the "shots" you get from time to time.

Inhaling airborne germs is a great danger in BW. Your protective mask, therefore, is an important item. A properly fitted mask which has been kept in good condition will greatly reduce the danger of your inhaling germs present in the air. Since you cannot detect the presence of biologic agents, you may be ordered to use your protective mask and protective equipment until the danger has passed. Your CO will base his decision upon information received from intelligence reports and the advice of his technical staff or higher headquarters. Several automatic alarm systems are under development.

Germs must actually get inside your body to cause disease. However, if a great many germs collect on your skin, they might get into your body in several ways, such as through your nose or mouth. Cuts or open sores are open doors to germs trying to enter your body. Be sure to keep cuts bandaged. Any type of clothing will give you some protection against BW. The degree of protection depends upon the size of the pores in the fabric and the number of layers of clothing worn. In order to keep out germs and disease-bearing insects such as mosquitoes, fleas, and ticks, it is important that the shirt and jacket collars be fastened, sleeves rolled down, cuffs buttoned, and all other clothes tied down to stop entry of germs which may be in the air or on the ground. The uniform you use for protection against chemical agents gives a higher degree of protection against BW agents than your ordinary clothing.

Treatment of BW Casualties

If you've ever had measles, you will remember that you had no idea when or where you were exposed. Several days after you were exposed to the germ you began to feel sick. Then the red rash appeared. Diseases caused by BW appear in this same way. THERE IS NO SELF-AID FOR BW CASUALTIES. The Navy gives you preventive "shots" for some diseases. If BW is ever used, additional "shots" have been developed which will be given to all hands. If you contract a disease from BW in spite of the "shots", the sickness will be mild, and you will get the best treatment that the medical men can give you.

Decontamination

If you are exposed to BW agents, scrub yourself thoroughly with soap and water as soon as the combat situation permits. Pay careful attention to your face and hands. A fingernail brush is a good item to have in order to remove dirt under your nails. Brush your teeth frequently—the roof of your mouth and tongue, as well as the gums and teeth. Take a bath or shower when it is possible. Change your clothes if they are contaminated. All washable clothes polluted with germs should be scrubbed clean at the first opportunity.

You should always be careful what you eat and drink in combat. If you are told that a BW

DEC 7935

attack has been made, you must be doubly careful. One of the easiest ways to get germs inside your body is to swallow them along with food and water. Don't forget that food and water are the natural homes of many disease producers. A few germs in your food will grow into millions in a very short time. Learn the commandments for defense against BW:

1. Remember the "BIO" sign; it means the area is contaminated with biologic agents.
2. Don't pick fruits or berries.
3. Don't chew grass or leaves.
4. Don't eat native food or drink native beverages. They may be contaminated intentionally or unintentionally.
5. Don't take souvenirs.
6. Eat only Navy food and drink only Navy beverages.
7. Don't bathe in lakes or ponds.
8. Don't touch animals.
9. Don't neglect preventive medicine.

Survival Tips for BW

Here are seven survival tips for biological warfare:

1. REPORT SICKNESS PROMPTLY. If you get sick, notify your unit medical personnel immediately.

2. KEEP YOURSELF AND YOUR LIVING QUARTERS CLEAN. Don't help germs by making things easy for them. Germs have trouble living in clean places. If you keep clean, the odds increase that you won't get sick.

3. DON'T NEGLECT PREVENTIVE MEDICINE. Take pills, "shots," or vaccinations when you are told to do so.

4. KEEP YOUR NOSE, MOUTH, AND SKIN COVERED. When BW agents are known to be present or are suspected of being present, use all of your protective equipment to keep them out of your body.

5. KEEP YOUR FOOD AND WATER PROTECTED. Bottled or canned foods are safe after a BW attack if the seals are not broken. Food in the open will be contaminated. If in doubt, boil the food for 10 minutes. That will kill most of the germs. Clean cans, packages, et cetera with soap and water before opening.

6. KEEP ALERT TO ANY SIGNS OF BW ATTACK. Any clues such as new or unusual types of shells or bombs, strange material sprayed by airplanes, smokes or mists of unknown nature, or other strange substances should be reported to your CO immediately.

WATCH OUT FOR BW "BOOBY TRAPS." The enemy may challenge your discipline and self-control by making available all sorts of tempting items of food. To eat or drink these contaminated items may mean death.

DEFENSE AGAINST NUCLEAR WARFARE

The explosion of a nuclear weapon like that of an ordinary bomb, causes damage by heat and blast. In addition, the nuclear explosion presents a third danger—nuclear radiation. You do not need to become an expert on the nuclear bomb, but there are some facts that you must understand to protect yourself from this weapon and nuclear radiation. Nuclear radiation is emitted at the time the bomb explodes, and also by particles called "fallout" which result from the bomb. These may cover large areas—many hundreds of square miles.

Effects of Nuclear Explosions

Although radiation is only one effect of a nuclear explosion, it has received much attention. To many, this effect has an air of mystery. Predictions were made that Hiroshima would never again be a safe place to live. Many rumors dealt with horrible injuries and sickness due to radiation. However, Hiroshima has been rebuilt. Crops grown in that area are safe to eat. The people are healthy and normal. The truth is that HEAT AND BLAST CAUSE MOST of the INJURIES.

Dangers of Radiation

You have already had contacts with radiation. In the form of cosmic rays from the sun, you have been bombarded by radiation every hour of your life. You know that too much exposure to the sun will result in severe sunburn. The effects of radioactivity may be compared to severe sunburn. You have also had X-rays taken of your chest. This was done by sending invisible, but powerful, rays into your body. You have heard of doctors using radium in the treatment of cancer. In receiving this treatment, the patient was exposed to powerful radiations. If you are an athlete, you may have taken infrared lamp treatments for a "charley horse." Like sun rays, X-rays, and

infrared rays, nuclear radiation is not a mysterious occurrence, but is easily understood by comparison with the above examples.

Rays, like BW agents, cannot be heard, seen, tasted, smelled, or felt. For example, when an X-ray is taken of your hand, you feel nothing. However, millions of X-rays have gone through your hand to the photographic plate. The light-shaded outline of your bones on the negative means that millions of X-rays have been stopped or absorbed by your bones. Too many X-rays will cause injury. They tend to tear down the body cells, especially the blood-forming cells. That is why a safety limit is set up. X-ray machine operators are allowed to absorb only a certain amount of radiation in a week. Likewise, service personnel working a radioactive or "hot" area will not be allowed to absorb radiation beyond a safe limit, which will be determined by their commander.

How Radiation Affects You

There are two ways you can acquire an overdose of radiation. You can be caught in the open when an nuclear bomb explodes nearby. If your distance from the point of explosion is great enough to protect you from blast and heat, gamma rays cannot reach you. However, if you are in the open within 800 to 1,000 yards of the burst, you will receive an overexposure to radiation because your clothes will not stop gamma rays. Overexposure occurs if you remain too long in an area which is radioactive from fallout. Your commander will tell you how long to stay in a radioactive area.

The first indication of an overdose of radiation probably will not show up for several hours. Then you most likely will get sick and begin to vomit. The time it takes you to get sick depends on how large a dose you get. The larger the dose, the quicker you get sick. For a few days you might continue to feel below par. But in spite of it all, you would still stand a better than even chance of complete recovery.

NW Protective Measures

In order to protect yourself against NW, you must know about the different kinds of nuclear explosions.

An AIR BURST is a nuclear explosion high in the air. This type of explosion does the greatest damage by blast and heat. The radiation from an air burst disappears fast and is called INITIAL RADIATION.

A GROUND OR WATER BURST is one which is low or on the surface. It produces less damage from blast and heat. It produces fallout radiation which lasts for quite a long time and is called RESIDUAL RADIATION.

Since an air burst does the greatest damage, that is the kind you can expect most often. With air bursts, the violent, upward surge of superhot gases and air sweeps radioactive ashes into the sky. Most of them are carried off in the drifting bomb clouds. Air explosions do not create "hot" areas. In fact, they leave almost no radiation on the ground. After a few minutes, your unit can move across the center of destruction with no danger from harmful rays.

Ground, underground, or water bursts leave a limited area "hot." Such bursts will limit the time that fighting forces can stay there.

Self-Protection

Air Bursts.—The important point to remember is that in a nuclear explosion, you do the same thing you would do in an ordinary bomb explosion. Speed in taking cover is vital. If you can protect yourself from heat and blast, you will also be protected from the dangerous initial gamma rays. Remember that residual radiation after an air burst is a very small danger. But initial gamma rays at the time of explosion are very dangerous. Fortunately, these initial rays are gone 10 seconds after the bomb explodes. If you take cover for a minute or two you should escape harm unless the explosion occurs very close to you. The type of cover you should take will depend upon your mission, location, whether or not you are warned, and many unforeseen factors. As with any explosion, the more material or distance between you and the burst, the safer you are. Falling flat and covering your face is better than standing. As is true with protection from all the dangers of war, you must make the most of what you have. Your training on protection against small arms or artillery fire is also good training for protection against nuclear bombs.

First Aid

In the case of an air burst, you may give first aid to casualties who received injuries from nuclear explosions without fear of becoming contaminated by the casualties. If the weapon has been detonated close to the ground, both you and

8E7937

the casualties may have some radioactive fallout on your skin and clothing. Your unit NBC personnel can tell you whether the amount is serious or not. Most of it can be removed by simply dusting and shaking of clothes. Treat for hemorrhage, shock, wounds, fractures, burns, and other injuries. These are by far the most important effects of the bomb. Men who have received radiation injury alone will need no first aid since the only symptoms they will show are vomiting and diarrhea, usually hours after the event.

Protective Equipment

Clothing.—Any type of clothing that covers you gives some protection against NW. In order to protect the clothes you are wearing from radioactive materials, extra covering is desirable. For example, if you are caught in the open, try to grab something to cover yourself when you fall to the ground. A board or some sheets of newspaper will help, but your raincoat is better. The object is, of course, to keep radioactive dust off your body and regular clothing.

Gloves And Mask.—When you enter a "hot" area, you must wear gloves to protect your hands. Touching radioactive material with bare hands may result in serious burns. Any kind of gloves will protect your hands. Later when you wash your hands, it will be easier to decontaminate them, especially your fingernails, if you have worn gloves. Your protective mask or dust respirator should be worn in a "hot" area to prevent inhalation of radioactive dust. Dust respirators may be used in place of the protective mask. The point to remember is never to inhale radioactive dust. Serious internal injury and radiation sickness may result. If there is no dust in the "hot" areas, it will probably be safe to enter without a mask. Your unit NBC personnel will check and advise the person in command whether a mask is needed.

Protecting Your Skin.—"Beta particles" (which are found in fallout), like blister gases may have a delayed action. Beta particles penetrate very far into your body, but they will damage your skin. Reddening of the skin may be an indication of this. Such damage, as with blister gas, may not appear until some time after exposure. You may not know you have received skin burns until it is too late. Play it safe by wearing any protective clothing you are issued in the manner that you are instructed to wear it.

Decontamination

If you suspect that you are contaminated, or, if detection equipment shows that you are, report to a personnel decontamination station as directed. Outer clothing will serve as a trap for most radioactive contamination. By taking off your clothes you may remove most of the contamination.

Upon reporting to the personnel decontamination station, follow the directions of the men operating the station. If none are posted at the station, necessary instructions will be posted on signs. Obey them to the letter.

The usual procedure at the personnel decontamination station is as follows: Discard clothing and equipment as directed. Enter shower and take a good bath, using plenty of soap and warm water. In washing, pay close attention to the hairy parts of your body and to your body creases. It is at these points that dirt, probably contaminated dirt, tends to gather. Do not forget your fingernails. After you have finished your shower, you will be directed to a monitor who will check you with a counter. If you are still contaminated, you will be sent back to take another shower. If you are free from contamination, you will go to the dressing room for a new issue of clothing and equipment.

Remember that bathing is the best way to remove radioactive contamination from your body. No special cleaning compound is necessary. Soap, brushes, and warm water will do the job.

Food and water can become contaminated. Avoid using uncovered food or water if they are in a radioactive area. Canned food and covered water may be used with safety. Rely on trained Navy men to check and declare harmless anything you take into your mouth.

Decontamination Expedients.—Since a shooting war will be going on, the situation may not permit you to go to a decontamination station. You must be able to remove most of the radioactive material with what you have on hand. Lingering radiation dies out quickly during the first few hours after a nuclear explosion, hence the little you may leave on after your "quickie"

TEC 7938

decontamination job probably will not harm you. If you become heavily contaminated—

1. Remove your outer garments. Shake them violently in the wind. This will remove most of the radioactive material, unless it is wet and muddy.
2. If it is too cold or wet to remove your outer clothing, brush or scrape them carefully.
3. This same procedure should be used to decontaminate your equipment.

SUMMARY

The use of chemical and biological agents and nuclear devices as potential weapons will remain a possibility as long as war exists. Therefore, all Navy personnel should familiarize themselves with the characteristics and effects of these weapons so that they may take measures to reduce their effectiveness.

The harmful effects of chemical and biological agents can be minimized if the protective devices supplied by the Navy are used promptly, and if self-protection measures are carried out by all hands. In self-aid and first aid, speed is the most important consideration—speed in masking, speed in removing the agents from the body, and speed in using protective ointments and injections.

The detonation of a nuclear device produces heat, blast, and radiation. Of these, the effects of radiation are most feared by those who don't know the facts. Actually most casualties are produced by heat and blast. Self-protection measures are similar to those taken for conventional explosive devices. The more material between you and the site of the blast, the better your chances of survival. Protective clothing provides some protection from nuclear contamination, and prompt decontamination by removal of outer clothing and by soap and water shower further reduces the effects of radiation.

0005 7939

CHAPTER 10

RESCUE AND TRANSPORTATION PROCEDURES

It is a basic principle of first aid that an injured person must be given essential treatment BEFORE he is moved. However, it is obviously impossible to treat injuries while the casualty is in a position of immediate danger. If he is drowning, or if his life is endangered by fire, steam, electricity, poisonous or explosive gases, or other hazards, he must be rescued before first aid treatment can be given.

The life of an injured person may well depend upon the manner in which he is being transported to a medical officer. Rescue operations must be accomplished quickly, but unnecessary haste is both futile and dangerous. After rescue, and after essential first aid treatment has been given, further transportation must be accomplished in a manner which will not aggravate his injuries.

In this chapter we will consider the use of common types of protective equipment, ways of effecting rescue from dangerous situations, emergency methods of moving injured persons to safety, and procedures for transporting them after first aid has been given.

PROTECTIVE EQUIPMENT

The use of appropriate items of protective equipment will substantially increase your ability to resuce a person from a threatening situation. Protective equipment that is generally available on naval vessels and at some shore activities includes oxygen breathing apparatus; hose (air line) masks; protective (gas) masks; asbestos suits; steel-wire life lines; and devices for detecting oxygen insufficiency, explosive vapors, and some poisonous gases.

Oxygen Breathing Apparatus

Oxygen breathing apparatus is provided for emergency use in compartments containing toxic gases and in which there is insufficient oxygen to support life. There is no limitation as to the concentration of gas, smoke, dust, or deficiency of oxygen in which the apparatus will function effectively. The apparatus is particularly valuable for rescue purposes because it is a self-contained unit. The wearer is not dependent upon outside air or upon any type of air line, within the effective life of the canister.

There are several types of oxygen breathing apparatus, but they are all similar in operation. Independence of the outside atmosphere is achieved by having air within the apparatus circulated through a canister. Within the canister, the air is continuously replenished with oxygen and continuously freed of impurities. The effective life of the canister varies from 45 minutes to 20 minutes, depending on the particular apparatus and the type of work being done. One of the newer types of oxygen breathing apparatus, shown in figure 10-1, is designed so that you can change canisters without leaving the toxic atmosphere.

If you are to enter an extremely hazardous area, you should also wear a lifeline. The lifeline should be tended by two persons, one of whom is also wearing a breathing apparatus.

Never allow oil or grease to come in contact with any part of an oxygen breathing apparatus. Oxygen is violently explosive in the presence of oil or grease. If any parts of the apparatus become contaminated with oil or grease smudges, clean it before it is stowed.

Care should be taken to prevent oil or oily water from entering the canister between the time it is opened and the time of disposal.

Hose (Air Line) Masks

Hose masks are part of the allowance of all ships having repair party lockers. They are smaller than the oxygen breathing outfits, and can therefore be used by persons who must enter

7940

5.97

Figure 10-1.—Type A-2 oxygen breathing apparatus.

voids or other spaces which have very small access hatches. The hose or air line mask consists essentially of a gas mask facepiece with an adjustable head harness and a length of airhose. Note that the air line mask uses AIR, rather than pure oxygen. It must NEVER be connected to an oxygen bottle, oxygen cylinder, or other source of oxygen; even a small amount of oil or grease in the air line mask would combine rapidly with the oxygen and cause an explosion. When properly connected to a suitable source of AIR, such as the low-pressure ship's service air line, the hose mask can be worn safely even in spaces which contain a high concentration of oil or gasoline vapors; for this service, in fact, the air line mask is superior to the oxygen breathing apparatus.

Notice in figure 10-2 that the man wearing the air line mask is also wearing a separate safety belt fitted with shoulder straps, a pocket for the hose connection, and a D-ring. One of these safety belts is furnished with each air line mask, and MUST BE WORN. A lifeline must be fastened to the D-ring; and the lifeline should be loosely lashed to the airhose to reduce the possibility of fouling. The airhose and lifeline must be carefully tended at all times, so that they will not become fouled or cut. The person wearing the air line mask and the person tending the lines should maintain communication by means of standard divers' signals.

Protective (Gas) Masks

Protective (gas) masks provide respiratory protection against nuclear, biological, and chemical warfare agents. They do not provide protection from the effects of carbon monoxide,

3.169

Figure 10-2.—Hose (air line) mask.

SP7941

carbon dioxide, illuminating gas, gasoline vapors, ammonia, and many other industrial gases.

In emergencies, protective (gas) masks may be used for passage through a smoke-filled compartment or for entry into such a compartment to perform a job that can be done quickly, such as close a valve, secure a fan or deenergize a circuit. However, they provide only limited protection against smoke. The length of time you can remain in a smoke-filled compartment depends on the type of smoke and its concentration.

The most important thing to remember about protective (gas) masks is that they do not manufacture or supply oxygen. They merely filter the air as it passes through the canister. Therefore, the protective (gas) mask should not be used in air containing less than 16 percent oxygen or in air having a heavy concentration of smoke from oil fires, except for very short periods of time.

Asbestos Suit

The Navy asbestos suit is made in a single unit, is easy to get into, and provides complete cover for the wearer. With it on, a firefighter can move quickly through flame to effect a rescue or perform some other job that can be done quickly.

While asbestos will not burn, it will char and conduct heat. Therefore, the suit provides protection against flame only for short periods of time. The length of time the suit can be worn depends upon the conditions under which it is used. The person wearing the suit should return immediately to a safe, cool area if he experiences severe discomfort such as difficulty in breathing or extreme heat. Heavy clothing should be worn under the suit to give additional protection from heat.

If the asbestos suit becomes wet, as is more than likely in firefighting, the wearer might be scalded, unless he withdraws from the heated area before the water turns to steam. Continued wetting will keep him cool, but the suit will become water-soaked and reduce his freedom of movement, already restricted by the cumbersome suit.

The asbestos suit may be worn with oxygen breathing apparatus. Whatever the type, the apparatus must always be worn over the suit (fig. 10-3).

3.170

Figure 10-3.—Asbestos suit (oxygen breathing apparatus worn outside).

Lifeline

The lifeline is a steel-wire cable, 50 feet long. (See fig. 10-4.) Each end is equipped with a strong hook that closes with a snap catch. The line is very pliable and will slide freely around obstructions.

Lifelines are used as a precautionary measure to aid in the rescue of persons wearing rescue breathing apparatus, hose masks, or similar equipment. Rescue, if necessary, should

187542

136.36

Figure 10-4.—Steel-wire lifeline.

be accomplished by having another man or men equipped with breathing apparatus follow the lifeline to the person being rescued, rather than by attempting to drag him out. Attempts to drag a person from a space may very well result in fouling the lifeline on some obstruction or in parting his harness, in which case it would still be necessary to send a rescue man into the space.

An important precaution in the use of lifelines should be obvious, but it is stated here because in the excitement of fire or other emergency it may be forgotten. A stricken person must never be hauled up by a lifeline attached to his waist. He may be dragged along the deck a short distance, but his weight must never be suspended on a line attached to his waist. If he is not wearing a harness of some kind, the line must be passed around his chest under his armpits and made fast either front or back.

When tending a lifeline, you must wear gloves to be able to handle the line properly. Pay out the line carefully, so that it will not foul. Try to keep the lifeline in contact with grounded metal, and do not allow it to come in contact with any energized electrical equipment.

Detection Devices

The detection devices used to test the atmosphere in closed or poorly ventilated spaces include the FLAME SAFETY LAMP, for detecting oxygen deficiency; COMBUSTIBLE-GAS INDICATORS, for determining the concentration of explosive vapors; and TOXIC-GAS INDICATORS, such as the CARBON-MONOXIDE INDICATOR, for finding the concentration of certain poisonous gases. These devices are extremely valuable, and should be used whenever necessary; however, they MUST BE USED ONLY AS DIRECTED. Improper operation of these devices may lead to false assurances of safety; or, worse yet, to an increase in the actual danger of the situation. For example, the use of a flame safety lamp in a compartment filled with acetylene or hydrogen could cause an explosion so violent that you would have no further interest in determining the oxygen content of the atmosphere.

RESCUE PROCEDURES

If you are faced with the problem of rescuing a person threatened by fire, explosive or poisonous gases, or some other emergency, do not take any action until you have had time to determine the extent of the danger and your ability to cope with it. The large number of accidents in which the rescuer rushes in and becomes the second victim would seem to indicate that this advice is hard to follow. Do not take unnecessary chances! Do not attempt any rescue that needlessly endangers your own life! You cannot help anyone, even yourself, if you are seriously injured or killed.

Rescue From Fire

If you must go to the aid of a person whose clothing is on fire, try to smother the flames by wrapping him in a coat, a blanket, or a rug. Leave his head UNCOVERED. First beat out the flames around his head and shoulders, and then work downward toward his feet. If you have no material with which to smother the fire, roll him over—SLOWLY—and beat out the flames with your hands. If he tries to run, catch him and throw him down. Remember that he MUST lie down while you are trying to extinguish the fire. If he runs, his clothing will burn rapidly. If he sits or stands, he may be killed instantly by inhaling flames or hot air.

CAUTION: Inhaling flame or hot air can kill YOU, too. Don't get your face directly over the flames. Turn your face away from the flame when you inhale.

7945

If your own clothing catches fire, roll yourself up in a blanket, coat, or rug. KEEP YOUR HEAD UNCOVERED. If material to smother the fire is not available, lie down, roll over slowly, and beat at the flames with your hands.

If you are trying to escape from an upper floor of a burning building, be very cautious about opening doors into hallways or stairways. When a building is on fire, hot air often collects in halls and stairwells. Always feel a door before you open it; if it feels hot, don't open it if there is any other possible way out. Remember, also, that opening doors or windows will create a draft and make the fire worse; so don't open any door or window until you are actually ready to get out.

If you are faced with the problem of removing an injured person from an upper story of a burning building, you may be able to improvise a lifeline by tying sheets, blankets, curtains, or other materials together. (Use square knots.) Secure one end around some heavy object inside the building, and fasten the other end around the casualty under his arms. You can lower him to safety, and then let yourself down the line. Do not jump from an upper floor of a burning building, except as a last resort.

It is often said that the "best" air in a burning room or compartment is near the floor, but this is true only to a limited extent. There is less smoke and flame down low, near the floor, and the air may be cooler; but carbon monoxide and other deadly gases are just as likely to be present near the floor as near the ceiling. If possible use oxygen breathing apparatus or other protective breathing equipment when you go into a burning compartment. If protective equipment is not available, cover your mouth and nose with a wet cloth to reduce the danger of inhaling smoke, flame, or hot air. REMEMBER, HOWEVER, THAT A WET CLOTH GIVES YOU NO PROTECTION AGAINST POISONOUS GASES OR LACK OF OXYGEN!

Rescue From Steam-Filled Spaces

It is sometimes possible to rescue a person from a space in which there is a steam leak. Since steam rises, escape upward may not be possible. If the normal exit is blocked by escaping steam, move the casualty to the escape trunk or, if there is none, to the lowest level in the compartment.

The equipment which offers protection against fire does NOT protect you against steam. In particular, it should be mentioned that the asbestos suit absorbs water, and is therefore of no value in a steam-filled space. Steam would penetrate the asbestos very quickly and the person wearing the suit would be scalded.

Rescue From Electrical Contact

Rescuing a person who has received an electric shock is likely to be difficult and dangerous. Extreme caution must be used, or you may be electrocuted yourself.

YOU MUST NOT TOUCH THE CASUALTY's BODY, THE WIRE OR ANY OTHER OBJECT WHICH MAY BE CONDUCTING ELECTRICITY.

Look for the switch first of all, and if you find it, turn off the current immediately. Don't waste too much time hunting for the switch, however; every second is important.

If you cannot find the switch, you should try to remove the wire from the casualty with a DRY broom handle, branch, pole, oar, board, or similar NONCONDUCTING object. It may be possible to use DRY rope or DRY clothing to pull the wire away from him. You can also break the contact by cutting the wire with a WOODEN-HANDLED axe, but this is extremely dangerous because the cut ends of the wire are likely to curl and lash back at you before you have time to get out of the way. When you are trying to break an electrical contact, always stand on some nonconducting material such as a DRY board, DRY newspapers, or DRY clothing.

Rescue From Unventilated Compartments

Rescuing a person from a void, double bottom, gasoline or oil tank, or any closed compartment or unventilated space is generally a very hazardous operation. Aboard naval vessels and at naval shore activities, no person is permitted to enter any such space or compartment until the gas-free engineer (or some person designated by him) has indicated that the likelihood of suffocation, poisoning, and fire or explosion has been eliminated as far as possible. The rescue of a person from any closed space should, therefore, be performed under the supervision of the gas-free engineer, or in accordance with his instructions. In general, it is necessary to observe the following precautions when attempting to rescue a person from any closed or poor ventilated space:

- If possible, test the air for oxygen deficiency, poisonous gases, and explosive vapors.

Moving the Casualty to Safety

In an emergency, you may have to hoist, carry, or drag an injured person away from a position of danger. In some instances you will be able to do this by means of the Neil Robertson stretcher, or by the use of improvised lifelines; in other cases you will have to move the casualty by using the fireman's carry, the tied-hands crawl, the blanket drag, the pack-strap carry, the chair carry, or some type of arm carry. Sometimes it is necessary to move him with all possible speed, without regard to the severity of his injuries. Remember, however, that when you move an injured person you are taking a calculated risk: YOU MAY KILL HIM BY MOVING HIM! You are justified in taking such a risk only when it is evident that he will die if you do not move him.

Neil Robertson Stretcher.—The Neil Robertson stretcher is specially designed for the purpose of removing an injured person from engine-room spaces, holds, and other compartments where access hatches are too small to permit the use of regular stretchers.

The Neil Robertson stretcher is made of semirigid canvas. When firmly wrapped around the casualty mummy-fashion, it gives sufficient support so that he may be lifted vertically. (See fig. 10-5). Note that a guideline is tied to the casualty's ankles to keep him from swaying against bulkheads and hatchways while he is being lifted.

Stretchers of this type can be made on board ship, and kept in appropriate places ready for use. If a Neil Robertson stretcher is not available when needed, a piece of heavy canvas, wrapped firmly around the casualty, will serve somewhat the same purpose.

Emergency Rescue Lines.—As previously mentioned, the steel-wire lifeline can often be used to haul a person to safety. An emergency rescue line can also be made from any strong fiber line. Both should be used only in extreme emergencies, when an injured person must be moved and no other means is available.

Figure 10-6 shows an emergency rescue line which could be used to hoist a man from a void or small compartment. Notice that a running bowline is passed around the body, just below the hips, and a half hitch just under the arms. Notice also that a guideline is tied to the casualty's ankles to keep him from banging against bulkheads and hatchways.

136.37

Figure 10-5.—Neil Robertson stretcher.

Fireman's Carry.—One of the easiest ways to carry an unconscious person is by means of the fireman's carry. Figure 10-7 shows the procedure:

1. Turn the casualty so that he is lying flat, face down, as shown in figure 10-7 (A). Kneel on

7946

136.38

Figure 10-6.—Emergency rescue line (using running bowline and half hitch).

one knee at his head, facing him. Pass your hands under his armpits; then slide your hands down his sides and clasp them across his back.

2. Raise the casualty to his knees, as shown in figure 10-7 (B). Take a better hold across his back.

3. Raise the casualty to a standing position, and stick your right leg between his legs, as shown in figure 10-7 (C). Grasp his right wrist in your left hand and swing his arm around the back of your neck and down your left shoulder.

4. Stoop quickly and pull the casualty across your shoulders and, at the same time, put your right arm between his legs, as shown in figure 10-7 (D).

5. Grasp his right wrist with your right hand and straighten up, as shown in figure 10-7 (E).

The procedure for lowering the casualty to the deck is shown in parts (F) and (G) of figure 10-7.

Tied-Hands Crawl.—The tied-hands crawl, shown in figure 10-8 may be used to drag an unconscious person for a short distance; it is particularly useful when you must crawl underneath a low structure.

To carry a person by this method turn him so that he is lying flat on his back. Cross his wrists and tie them together. Kneel astride the casualty and lift his arms over your head so that his wrists are at the back of your neck. When you crawl forward, raise your shoulders high enough so that the casualty's head will not bump against the deck.

Blanket Drag.—The blanket drag, shown in figure 10-9, can be used to move a person who is so seriously injured that he should not be lifted or carried by one man alone. Place the casualty on his back on a blanket, and pull the blanket along the floor or deck. Always pull the casualty head first, with his head and shoulders slightly raised, so that his head will not bump against the deck.

Pack-strap Carry.—With the pack-strap carry, shown in figure 10-10, it is possible to carry a heavy person for some distance. Use the following procedures:

1. Place the casualty lying down, face up.

2. Lie down on your side along the casualty's uninjured or less injured side. Your shoulder should be next to his armpit.

3. Pull the casualty's far leg over your own, holding it there if necessary.

4. Grasp the casualty's far arm at the wrist and bring it over your upper shoulder as you roll and pull him onto your back.

5. Rise up on your knees, using your free arm for balance and support. Hold both of the casualty's wrists close against your chest with your other hand.

6. Lean forward as you rise to your feet, and keep both of your shoulders under the casualty's armpits.

Do not attempt to carry a seriously injured person by means of the pack-strap carry, especially if his arms, spine, neck, or ribs are fractured.

Chair Carry.—The chair carry can often be used to move a sick or injured person away from a position of danger. The casualty is seated on a chair, as shown in figure 10-11, and the chair is carried by two men. This is a particularly good method to use when you must carry a person up or down stairs or through narrow, winding passageways. It must NEVER be used to move a person who has an injured neck, back, or pelvis.

Figure 10-8.—Tied-hands crawl.

136.41

Figure 10-9.—Blanket drag.

136.42

Figure 10-10.—Pack-strap carry.

Arm Carries.—There are several kinds of arm carries which can be used, in emergency situations, to move an injured person to safety. Figure 10-12 shows how one person can carry the casualty alone. However, you should never try to carry a person this way if he is seriously injured. Unless he is considerably smaller than you are, you will not be able to carry him very far by this method.

The two-man arm carry, shown in figure 10-13, can be used in some cases to move an injured person. However, it should not be used to carry a person who has serious wounds or broken bones.

Another two-man carry which can be used in emergencies is shown in figure 10-14. Two men kneel beside the casualty about at the level of his hips, and carefully raise him to a sitting position. Each man puts one arm under his thighs; hands are clasped and arms are braced as shown in figure 10-14(A). Both men then rise slowly and steadily to a standing position, holding the casualty as shown in figure 10-14(B). This carry must not be used to move seriously injured persons.

TRANSPORTATION OF THE INJURED

Thus far in this chapter, we have dealt with EMERGENCY methods used to get an injured person out of danger, into a position where he can receive first aid. As we have seen, these emergency rescue procedures often involve substantial risk to the casualty and should be used ONLY when clearly necessary.

7949

136.43

Figure 10-11.—Chair carry.

136.44

Figure 10-12.—One-man arm carry.

136.45

Figure 10-13.—Two-man carry by arms and legs.

Once you have rescued the casualty from the immediate danger which threatened him, SLOW DOWN! From this point on, handle and transport him with every regard for the injuries which he has sustained. In the excitement and confusion which almost always accompany an accident, you are likely to feel rushed, as though you must do everything rapidly. To a certain extent, this is a reasonable feeling to have: Speed is essential in treating many injuries, and in getting the casualty to a medical officer or hospital. However, it is NOT reasonable to let yourself feel so hurried that you handle him roughly or carelessly, or transport him in a way which will aggravate his injuries.

General Precautions

The basic precautions which must be observed in transporting an injured person may be summarized as follows:

- Give necessary first aid BEFORE attempting to transport the casualty. Be sure that all injuries have been located. Treat serious bleeding, asphyxia, and shock. Immobilize all fractures, sprains, and dislocations. Do whatever you can to reduce the casualty's pain and to make him as comfortable as possible under the circumstances.
- Use a regular stretcher, if one is available; if you must use an improvised stretcher, be sure that it is strong enough. Be sure, also, that you have enough men to carry the stretcher, so that you will not run any risk of dropping the casualty.
- Whenever possible, bring the stretcher to the casualty instead of carrying him to the stretcher.

7950

136.46

Figure 10-14.—Two-man arm carry.

- Fasten the casualty to the stretcher so that he cannot slip, slide, or fall off. Tie his feet together, unless he has injuries which make this impracticable.
- Use blankets, garments, or other material to pad the stretcher and to protect the casualty from exposure.
- As a general rule, an injured person should be lying on his back while he is being moved. However, in some instances the type of injury or location of the injury will necessitate the use of another position. A person who is having difficulty in breathing because of a chest wound may be more comfortable if his head and shoulders are slightly raised. A person who has a broken bone should be moved very carefully, so that the injury will not be made worse. (Chapter 7 gives specific instructions concerning the transportation of persons who have suffered serious fractures.) If the casualty has received a severe injury to the back of the head, he should be kept lying on his side while he is being transported. In all cases, it is important to place him in the position which will best protect him from further injury.
- The stretcher should be carried in such a way that the casualty will be moved FEET FIRST.
- If you must use a motor vehicle to transport a seriously injured person, DO NOT USE A PASSENGER CAR EXCEPT IN EXTREME EMERGENCY! It is difficult to get an injured person into a car without causing further injury and pain; and it is almost impossible to keep him lying flat in a passenger car. The best means of transportation is, of course, an ambulance; if no ambulance is available, however, a truck or station wagon makes a fairly good substitute.

If it is absolutely necessary to use a passenger car to transport a seriously injured person, do not attempt to put him in the car until you have figured out the best place for him to be and the best way to fit him into it! An injured person is in no condition to be used as a measuring stick; don't put him anywhere in the car until you are sure that he can be fitted in without undue bending, twisting, or turning.

- Do not turn the casualty over to anyone without giving a complete account of the situation. Be sure that the person taking over knows what caused the injury and what first aid treatment has been given. If the casualty has received morphine, use a skin pencil, crayon, or blood to mark a large red "M" and the time

Secr 7951

on his forehead and attach the used morphine syrette to his collar. If a tourniquet has been applied, mark a large red "T" on the medical tag or on a conspicuous place on the casualty and make sure that this is known to the person who is taking charge of the casualty.

Stokes Stretcher

The Navy service litter most commonly used for transporting sick or injured persons is called the Stokes stretcher. As shown in figure 10-15, the Stokes stretcher is essentially a wire basket supported by iron or aluminum rods. It is adaptable to a variety of uses, since the casualty can be held securely in place even if the stretcher must be tipped or turned. The Stokes stretcher is frequently used aboard ship, and is particularly valuable for transferring injured persons to and from boats. As mentioned before, it can often be used to rescue injured survivors from the water. It is also used for direct ship-to-ship transfer of injured persons.

136.47

Figure 10-15.—Stokes stretcher.

The Stokes stretcher should be padded with three blankets: two of them should be placed lengthwise, so that one will be under each of the casualty's legs, and the third should be folded in half and placed in the upper part of the stretcher to protect his head and shoulders. The casualty should be lowered gently into the stretcher, and made as comfortable as possible. His feet must be fastened to the end of the stretcher so that he will not slide up and down. Another blanket (or more, if necessary) should be used to cover him. The casualty must be fastened into the stretcher by means of the straps which go over his chest, hips, and knees. Note that the straps go OVER the blanket or other covering, and thus hold it in place.

Army Litter

The Army litter, shown in figure 10-16, is a collapsible stretcher made of canvas and supported by wooden or aluminum poles. It is very useful for transporting battle casualties in the field. However, it is sometimes difficult to fasten the casualty onto the Army litter; and for this reason its use is somewhat limited aboard ship.

136.48

Figure 10-16.—Army litter.

Improvised Stretchers

The Stokes stretcher or the Army litter should be used, if possible, whenever it is necessary to transport a seriously injured person. If neither of these stretchers is available, however, it may be necessary for you to improvise some way of carrying the seriously injured.

Shutters, doors, boards, and even ladders may be used as stretchers. All stretchers of this kind must, of course, be very well padded; and great care must be taken to see that the casualty is fastened securely in place.

Sometimes a blanket may be used as a stretcher, as shown in figure 10-17. The casualty is placed in the middle of the blanket on his back. Three or four men kneel on each side, and roll the edges of the blanket toward the casualty as shown in figure 10-17 (A). When the rolled edges are tight and large enough to grasp securely, the casualty should be lifted

7952

136.49

Figure 10-17.—Blanket used as an improvised stretcher.

and carried, as shown in figure 10-17(B). CAUTION: This type of stretcher must not be used for seriously injured persons, particularly those with fractures.

Stretchers may also be improvised by using two long poles (about 7 feet long) and any strong cloth, such as a rug, a blanket, a sheet, a mattres cover, two or three gunny sacks, or two coats or jumpers. Figure 10-18 shows an improvided stretcher made from two poles and two jumpers.

CAUTION: Many improvised stretchers do not give sufficient support to be used in cases where there are fractures or extensive wounds of the body. They should be used only when the casualty is able to stand some sagging, bending, or twisting, without serious consequences.

136.50

Figure 10-18.—Stretcher made from poles and jumpers.

Loading a Stretcher

One of the best ways to lift an injured person onto a stretcher is by means of the EIGHT-MAN CARRY. This is the safest method to use when you must move a person who has a fractured neck, back, or pelvis.

The casualty is placed so that he is lying on his back. Four men kneel on each side of him, each man kneeling on the knee closest to the casualty's feet. Each man then works

his hands, wrists, and forearms underneath the casualty until the palms of the bearers' hands are directly under the midline of his head, neck, back, or legs. The bearers' hands are positioned alternately from the two sides. The two hands under the casualty's head should be clasped so as to give firm support for the head.

Keep the casualty lying perfectly straight while he is being lifted and while he is being lowered onto the stretcher. Do not allow his body to sag, bend, or twist. Lift and lower only on the command of one person, so that all movements will be synchronized.

The method of lifting described for the eight-man carry can be adapted for use by a smaller number of men, if appropriate support is provided at all essential points. The THREE-MAN CARRY, shown in figure 10-19, is often used to lift an injured person onto a stretcher or to carry him for a short distance. The three men line up on the same side of the casualty and kneel on the knee nearest to the casualty's feet. The bearers then position their hands and arms as follows:

- The bearer nearest the casualty's head places one arm under the casualty's head, neck, and shoulder, and the other under the upper part of his back.
- The middle bearer puts one arm under the small of the back, and the other under the thighs.
- The bearer nearest the casualty's feet puts one arm under the casualty's knees, and the other under his ankles.

In actually lifting and carrying the casualty, the three bearers must synchronize their movements so that his body is kept straight and firm, and is not allowed to bend, twist, or sag.

136.51

Figure 10-19.—Three-man carry.

SUMMARY

Essential first aid treatment should be given before an injured person is moved. After he has been examined, positioned according to the type of injury, treated for shock if required, and had splints applied when a fracture is a consideration, the problem remaining is to move him to where he may be transported to a medical officer. However, at times it may be necessary to move a casualty without prior first aid treatment if his safety or life is threatened. In moving the casualty to safety, use the drag, carry, or hoist that does the least to aggravate or compound his injuries.

7954

Rescuing a person from certain situations presents dangers to the rescuer. Know the hazards and make use of the available protective equipment. Be sure that you know not only the uses of the protective equipment but also its limitations so that you yourself need not be rescued. Before you attempt to rescue a person, be sure that you can cope with the situation. You should be physically able to effect the rescue without unnecessarily endangering your own life. Obviously, a man who cannot swim should not jump into the water to rescue someone drowning, but it has happened. Often other means can do the job just as well, and with a greater margin of safety.

In transporting the casualty to a medical facility, use a stretcher, if one is available. If not, use an improvised stretcher that is strong enough to hold him. Place him on the stretcher in the position recommended for the particular type of injury. Transport the casualty feet first so that the rear bearer may continuously observe the casualty for breathing difficulty and hemorrhage.

7955
doc

APPENDIX I

COMMON EMERGENCIES

Description	What To Do
UNCONSCIOUSNESS: Lack of awareness, lack of responsiveness. In deep states of unconsciousness, victim cannot be aroused. In partial unconsciousness, victim may show intermittent responsiveness but appear to be unaware of his surroundings. Unconsciousness is symptom of many different illnesses and injuries, including: Head injury Acute alcoholism Apoplexy Poisoning Asphyxiation Severe hemorrhage Convulsive seizures Shock Heart attack Heatstroke Heat exhaustion Prolonged exposure to cold	FOR UNCONSCIOUSNESS, WHEN CAUSE IS NOT KNOWN: 1. If victim is pale: Keep him lying down, head level with or slightly lower than feet. Keep him warm, but do not overheat him. 2. If victim is flushed: Keep him lying down, with head and shoulders slightly raised. Apply cold cloths to head. Cover victim only if he appears to be cold; be particularly careful not to overheat him. GENERAL PRECAUTIONS: Examine victim for signs of injury—hemorrhage, asphyxiation, poisoning, heatstroke, etc. In particular, be careful to observe victim's breathing. If breathing fails, give artificial respiration. However, do not give artificial respiration merely because victim is unconscious! Do not confuse unconsciousness with lack of breathing! Never attempt to give liquids to unconscious person. Never give morphine to unconscious person. Do not assume that person is drunk, merely because you find him unconscious, with odor of alcohol on his breath! If you make this assumption, you may cause unnecessary loss of life. Keep unconscious person lying down while you transport him. Get medical attention as soon as possible.

7956

Appendix I—COMMON EMERGENCIES

Description	What To Do
FAINTING: Brief period of unconsciousness, with spontaneous recovery. Contributing causes: Hunger Pain Exhaustion Emotional stress Symptoms: Nausea, weakness, dizziness Unconsciousness Excessive perspiration Pale, moist skin	FOR FAINTING: 1. Lower victim's head. If victim is unconscious, keep him lying down, head lower than his feet (shock position). If victim is weak, dizzy, etc., but has not yet become unconscious, have him lean over so that his head is lowered; or have him sit in chair, bend forward at waist until his head is between his knees. 2. Hold smelling salts or other ammonia inhalant under victim's nose. These stimulants are helpful in some cases. 3. If victim does not recover within few minutes, get medical care for him.
HEART ATTACK: Improper functioning of heart Symptoms: Symptoms vary greatly, depending upon basic cause. Symptoms may include: Violent, agonizing pain (present in many but not all cases of heart attack) Acute fear and anxiety Faintness Breathing difficulty Unconsciousness	FOR HEART ATTACK: 1. Keep victim quiet. If victim has trouble breathing, prop him up as much as necessary to ease his breathing. If he does not have breathing difficulty, keep him lying down. Do not let him move about. 2. Keep victim warm, but do not overheat him. 3. Reassure victim. Anxiety is likely to be intense, and may make victim's condition worse. If victim carries medicine prescribed for such attacks, help him to take it. 4. Get medical help at once.
APOPLEXY (sometimes called a stroke or a shock): Sudden collapse caused by rupture of blood vessel in brain. (Most likely to occur in persons past 50 years of age) Symptoms: Unconsciousness Paralysis of one side of body; mouth drawn to one side; one side of body more limp than other Face flushed, as a rule; but may be very pale Strong, slow pulse Pupils sometimes unequal in size	FOR APOPLEXY: 1. Keep victim lying on his back, head and shoulders slightly raised. 2. Apply cold cloths or ice bag to head. 3. Keep victim warm, but do not overheat him. 4. Get medical help at once. PRECAUTIONS: Do not move victim unless it is absolutely necessary to do so. Do not use stimulants (smelling salts, etc.) Keep victim absolutely quiet.

7957

Description	What To Do
CONVULSIVE SEIZURES May be caused by: Epilepsy Brain injury Poisoning Electric shock Fever, etc. Symptoms may include: Extreme restlessness and irritability Total or partial loss of consciousness Convulsive muscular movements (twitching, thrashing, jerking, biting, etc.) lasting from a minute or two to about half an hour Involuntary action of bowels and bladder. Quiet stupor or unconsciousness may follow symptoms listed above. Victim may then become conscious, or pass into deep sleep. Death rarely occurs from convulsion itself, but may occur as result of accident—victim may be drowned, burned, crushed by machinery, run over by car, etc., while unable to help himself.	FOR CONVULSIVE SEIZURES: 1. Protect victim from external injury. Move him away from dangerous place. 2. Prevent victim from injuring himself. Put folded cloth or pencil wrapped in cloth between victim's teeth to keep him from biting his tongue. Put pillow, coat, rug, etc. under victim's head to protect it from injury. Loosen all constricting clothing. Be sure victim's tongue does not fall back and prevent him from breathing. 3. Keep victim warm. 4. Watch victim's breathing. Breathing may stop as convulsive movements stop, or just before. Breathing usually begins again spontaneously. If it does NOT begin within 1 minute, start giving artificial respiration. 5. Do not disturb victim unnecessarily. Do not attempt to restrain victim's convulsive movements. Do not disturb victim during period of sleep or unconsciousness which usually follows convulsive seizure. 6. Get medical attention at once. Convulsions are sometimes (although not always) indication of serious illness.
ACUTE ALCOHOLISM: Poisoning caused by consumption of excessive amount of alcohol Symptoms: Shock, collapse, unconsciousness	FOR ACUTE ALCOHOLISM: 1. Keep victim quiet. Acute symptoms may disappear if victim is allowed to sleep quietly for several hours. 2. Keep victim warm. Cover victim, and apply external heat if necessary.

7958
7957

Description	What To Do
Face flushed at first, then pale Pulse strong at first, then weak Pupils equal in size Odor of alcohol on breath CAUTION: Do not assume that victim is suffering from acute alcoholism merely because you find him unconscious, with odor of alcohol on his breath. Check him carefully for injuries and illnesses.	3. Give emetic, if victim is conscious and cooperative when you first discover him. (See chapter 5.) 4. Give liquids, when victim is conscious. Water and orange juice should be given in large quantities. Coffee may be helpful. 5. Watch victim's breathing. For greatly depressed breathing, give oxygen-carbon dioxide mixture, if apparatus is available and you know how to use it. If breathing fails, give artificial respiration.

Real Estate Primer. A Basic Study Guide for the Applicant for a Real Estate Salesman's License.

Oregon State Dept. of Commerce, Salem. Real Estate Div.
MF AVAILABLE IN VT-ERIC SET.
Oregon Dept. of Commerce, Real Estate Division, 158 12th Street, N.E., Salem, Oregon 97310 ($3.00).
PUB DATE - 70 290p.

DESCRIPTORS - *RESOURCE MATERIALS; *STUDY GUIDES; SUPPLEMENTARY TEXTBOOKS; *REAL ESTATE OCCUPATIONS; *REAL ESTATE; PROPERTY APPRAISAL; *ADULT VOCATIONAL EDUCATION

ABSTRACT - This primer may be used both as a basic introduction to the real estate field and as a supplementary reference or review source for applicants for a real estate salesman's license. Contents include sections on: (1) study tips, (2) licensing procedures, (3) real estate definitions and regulations, (4) land descriptions, (5) real property laws, (6) estates and interests, (7) landlord-tenant interaction, (8) mortgages, trust deeds, liens, contracts, and deeds and conveyances, (9) operation of the real estate office, (10) real property taxation, (11) water rights, plats, and subdivisions, (12) appraising, (13) real estate financing, (14) land abstracts, title, and title insurance, (15) real estate documents, (16) mathematics used in real estate, and (17) definitions of commonly used real estate words and phrases. Numbered questions similar to those in the real estate licensing examination are scattered throughout the text, and are keyed to an included answer key. Excerpts from Oregon real estate laws and rules and regulations of the Oregon Real Estate Board are also included as well as the Realtor's Code of Ethics. (AW)

PREFACE

This Primer is a basic introduction to the broad field of real estate. An applicant who will seriously apply himself to hard study of its contents should make a passing grade in the real estate examination.

It can also be an excellent supplement to the undergraduate study of real estate and as a basic review in post-licensing classes.

An applicant should realize that in preparing for the real estate examination he is in fact taking the first step toward a new mode of livelihood. If he is to be successful in this highly competitive and skilled vocation, he cannot afford to be lazy in his pursuit of knowledge.

Many fine schools and a great number of excellent texts on real estate subjects are available to him. Success in the examination and reward in practice will be measured by the extent of his use of these tools.

Throughout the text there are many numbered questions typical of those found in the examination. The best answers to these questions are found in the back of the Primer, beginning on Page 260.

When being used as a reference source, it is suggested that search first be made in the Definitions of Real Estate Words and Phrases, beginning on Page 195. A clue to information sought is often found here and, frequently, the question is fully answered.

HOW TO STUDY

Introduction

Our increasingly complex economy and society are daily making more technical demands upon us as citizens and workers. Higher levels of education and training are taken for granted in many vocations. Such trends are especially evident in the field of real estate, which is attempting to achieve higher professional standards. This is an age of the specialist. Specialized knowledge in such subjects as economics, marketing, selling, real property law, taxation, and valuation has now become a necessity. The required information may be acquired in a regular classroom or by independent study. However accomplished, the task will require study and the reading of technical works which many will find difficult.

It is the purpose of this brief presentation to sketch some of the main principles of effective study. Interestingly enough, the one course which is not taught in college is probably needed above all others. How to Study! It is taken for granted that the students know how to study; surely after 12 years of elementary and secondary education they would have acquired efficient and effective study habits. Yet it is painfully evident, as one surveys the many drop-outs and the high percentage on probation, that many of these students could have done much better with proper study habits. There are certain "tricks to the trade" in the learning process which can lead to a more satisfactory performance - often in less time. Improved study habits cannot make a genius out of a moron, but few people will fail to benefit from them.

The real estate practitioner can benefit even more than the students, for he has probably been out of school for a number of years and is rusty in his study habits. Studying will be a painful task, at best, for many. It is never too late to improve your study skills.

Your Study Schedule

For those persons taking a course or doing independent study in addition to their regular jobs, the problem of finding the time to study is not easily resolved. Ideally, one should be rested and refreshed before tackling a study period, especially if difficult reading is involved. This ideal can rarely be realized when study must be secondary to our job, but we can try to schedule our activities

7969

so that we establish a pattern of study at certain hours for certain periods of time. You may have to study during week-ends, or the early evening hours, or even early in the morning, during the week.

Don't study uninterruptedly for too long a time. Take a short break at least once an hour. If your attention span dwindles, it is time to take a break. It is not how long you study as how well you study. Staring dully at the book for hours on end is usually a waste of time.

The Study Setting

Selecting a proper place to study is a point which cannot be over-emphasized. Pick a spot which is as quiet as your office or home conditions allow. Those individuals who insist upon studying in front of a TV set, a blaring radio, or chattering family are only kidding themselves.

Try to reduce the elements that might distract to a minimum. Study is hard work, even under the best conditions. Anything which tends to take your mind off your work should be avoided. This includes such things as pictures or mementos on your desk which may interrupt your train of thought as you recall fond memories.

Frame of Mind

Motivation plays a major role in learning. It explains why some persons of ordinary intelligence outperform other persons of greater intelligence. Your attitude towards your work is an important element in how easily and successfully you gain a command of the material. Not every subject is of equal interest to each of us. This is reasonable. Some people, however, have a positive fear or dislike of subjects such as economics or math. Their negative attitude leads to further poor performances and a still more negative attitude.

We cannot be expected to like each topic or book equally well. It is important that we decide at the outset we will make the best of the situation. The "power of positive thinking" plays an important role here. It enables us to generate more interest in what at first seemed an otherwise dull topic. Try to capture some of the joy of learning the sense of power that comes with mastering a subject.

Four Steps to Learning

7970

1. Survey - A common error of many students involves plunging immediately into reading without first surveying the way the material has been organized. Consequently, they fail to grasp the main points which are usually found in the chapter titles and headings. They skip the preface - often a very important part of a book - and the table of contents. Step one, therefore, it to survey your reading; skim through it and get a good idea of its over-all structure and the main ideas. If you were actually writing a book, this would be your most important task - to organize and outline your presentation. This is the time to survey the forest before getting into the trees.

2. Reading - Experts advise at least three readings of an assignment. The first should be the skim-through which will give you an overview. The second should attempt to connect the main ideas and headings with the specific information. The third reading should concentrate on details and exact means. Don't expect to understand technical material on the first reading; otherwise, you become needlessly discouraged.

Don't real listlessly or passively. You must read actively and intently. Text books cannot be read like a novel; they must almost be grappled with as in combat. Note the lead sentences and headings and the illustrations. Many people pass these by without realizing their importance. Maps, graphs, tables, etc. may be the missing ingredient to better understanding. For especially difficult passages, some persons find it useful to read aloud as if giving a speech. They find that in trying to get across the material to a hypothetical audience they increase their own understanding. Have a dictionary handy to check the meaning of unfamiliar words.

3. Recitation - Many people read in a very passive manner, thinking they know the material. Later they find to their surprise how little they knew. They failed to check their understanding by constantly asking themselves questions about the material and attempting to explain in their own words the meaning of certain points. Recitation reveals areas of ignorance - give these special attention.

Don't think this is an unimportant rule. Recitation can make the difference in how much you remember. Stop at intervals and recite the substance of each major section of a chapter - without looking at the text! This is simply a means of doing your own tutoring.

4. Review - Almost everyone reviews before an examination but most people do not review enough and they do it at the wrong time. They wait until the last minute to do any reviewing and then try to cram the whole process into a short time. You should review the

7971

material at least a couple of times before the final review. (The first review is quite similar to recitation in the sense that it helps indicate those parts in which you need more work.)

Many students review by re-reading underlined passages in the text. Tests have indicated, however, that outlining the material in your own words is a superior method of summarization. A good outline is your best review device plus your class notes - if you are taking a class.

Conclusion

The suggestions and rules you have just read are based on years of educational research and tested on thousands of students. They will work if you give them a chance; but it should be emphasized that acquiring new study habits is not easy.

You will have to work hard at changing familiar - but sloppy - habits. A single hour spent on consciously improving your study habits, however, may save many more hours later in more efficient study. Above all, you should be able to improve your learning performance and become a more successful, respected member of your profession.

7972

LICENSE PROCEDURE

Most vocations require certain minimum qualifications for the beginner. Almost universally the standards and the method of ascertaining possession of these qualifications rests with some responsible authority.

Since 1939, applicants for an Oregon real estate license have been required to pass a written examination. The examination is prepared, conducted and graded under supervision of the Oregon Real Estate Board.

Application for a license is made upon a form supplied by the Commissioner, the payment of an examination fee of $10 and satisfactory proof of the necessary qualifications.

REQUIRED QUALIFICATIONS FOR ALL APPLICANTS

Satisfactory proof of honesty, truthfulness, and a good reputation.

At least 21 years of age, a citizen of the United States, and a resident of Oregon.

Pass an examination as to his knowledge of real estate as a vocation.

Q. What information is an individual applicant for a broker's license required to give with his application?

A. His name, address, the name under which, and the place or places where, the business is to be conducted; his previous experience in the real estate business and disclose in what occupation he was engaged for five years prior to the date of the application. Disclose whether or not he has ever been convicted or is under indictment for forgery, embezzlement, obtaining money under false pretenses, larceny, extortion, a crime involving moral turpitude, conspirancy to defraud or other like offenses; whether or not he has ever been refused a real estate broker's or salesman's license or any other occupational license and whether or not such a license has ever been revoked or suspended. The application must be accompanied by the recommendation of three resident citizens, not related to the applicant, who have owned real estate at least three

7973

years in the county where the applicant resides, certifying that the applicant bears a good reputation for honesty, truthfulness and fair dealing, and recommending that a license be granted.

Q. What information must a salesman submit with his application for a license?

A. The information is generally the same as that required of the broker applicant, and in addition must be accompanied by a special character-credit report from a credit reporting bureau.

Q. What subjects does the law require to be covered by the examination.

A. Reading, writing, spelling, arithmetic and computation, salesmanship, appraising, accounts, real estate ethics, real estate taxation, problems in real estate and a general knowledge of the provisions of the law.

Q. How may one prepare himself for the examination?

A. A thorough study of the Real Estate License Law, the Rules and Regulations of the Real Estate Board and Code of Ethics is recommended. A Real Estate Primer is available from the Real Estate Division at a nominal cost. There are a number of excellent private schools and courses available in many locations in the state. Most of the Community Colleges offer in-depth courses for the practitioner and the beginner, and most bookstores contain a "real estate shelf" which might be helpful.

Q. If an applicant has passed an examination and a license has been issued to him is it necessary for him to take a new examination with each annual renewal of the license?

A. No. Upon payment of the renewal fee the Commissioner will renew the license for a further period, expiring on the licensee's next birthday.

Q. Is it lawful for an applicant to engage in the real estate business as soon as he makes his application for a license and before the granting of the same?

A. No. The License must be issued and delivered.

Q. Must I find employment with a broker before taking the salesman's examination?

A. No. You have one year after passing the examination in which to activate your license.

FEES OF THE REAL ESTATE DIVISION

Each examination applied for	$10.00
Broker's license	25.00
Annual renewal thereof	25.00
License to member of firm or officer of corporation, other than person designated in application	25.00
Annual renewal thereof	25.00
Associate broker's license fee if broker's license fee has previously been paid	25.00
Annual renewal thereof	25.00
Salesman's license	15.00
Annual renewal thereof	15.00
Renewal of broker's inactive license	10.00
Renewal of salesman's inactive license	7.50
Reactivation of broker's inactive license	25.00
Reactivation of salesman's inactive license	15.00
Each additional place of business	5.00
Each change of location	5.00
Transfer of salesman's license	5.00
For each salesman, associate broker or branch office license reissued with change of name or change of location	1.00
Duplicate of broker's license	2.00
Duplicate of salesman's license	2.00
Duplicate of pocket card	1.00
Certified copies, certificate	2.00
Certified matter, per folio	.25
Uncertified copies, per folio	.25
Directory of licensees	1.00
The Oregon Manual, additional copies and to non-licensees	5.00
Real Estate Primer	
Educational pamphlets, per each	

PURPOSE AND SCOPE OF THE EXAMINATION

After meeting the minimum basic qualifications each applicant for a real estate license must demonstrate by written examination

7975

competence in the following:

(a) A basic knowledge of the English language, including reading, writing and spelling.
(b) An ability to compute mathematical problems related to normal real estate transactions.
(c) An understanding of the principles of real estate, which includes elementary real estate economics, transfer and conveyance of real property, deeds, mortgages, land contracts of sale, leases and appraisal.
(d) A general and fair understanding of the obligations between a principal and his agent, and the canons of business ethics.
(e) A thorough knowledge of the Oregon Real Estate Brokers' Law and the Rules and Regulations of the Real Estate Board.
(f) Familiarity with the principles of the Code of Ethics.

Examinations prepared by the Board consist of questions covering one or all of the above subjects. There also may be questions regarding the law or policy of other governmental agencies relating to real estate.

Ambiguous questions are avoided. The so-called "trick question" is never included.

The examinations are qualifying and not competitive.

Successful examination results are confidential as to grade scored.

The applicant failing to score a passing grade is notified of his grade. This is done to assist him in future study and preparation.

The law places no duty or responsibility on the Board or the Division to help in the study or preparation of an applicant for a license. This is the sole responsibility of the applicant.

The applicant can be assured of a passing grade if he meets the standards required in the examination.

The Real Estate Board emphasizes there is no quota on the number passing or failing. All examinees receiving a grade score of 75 or better will be issued a license, whereas scores below 75 will be graded as failures.

TIME IS OF THE ESSENCE

The Board recognizes the Division must have sufficient time to process applications and compile an accurate list of eligibles. This

list must be delivered to Board Members at least 5 days before the examination.

It is also recognized that each applicant is entitled to a reasonable time to complete and file his application with the Division.

Both needs are satisfied through the establishment of closing dates or "deadlines". Notice of closing dates appear in each issue of the Oregon Real Estate News, with information as to the examination to which they apply. Once the notice has been published the applicant assumes full responsibility for timely filing of his application. No machinery is available for the late filing of an application.

CLOSING DATES HAVE BEEN ESTABLISHED AS FOLLOWS:

July 15 for the August examination.
September 15 for the October examination.
November 15 for the December examination.
January 15 for the February examination.
March 15 for the April examination.
May 15 for the June examination.

NOTICE TO APPEAR FOR EXAMINATION - Salesman

Approximately 15 days before the examination an official notice to appear for examination is mailed to the applicant. The time and place at which the applicant will report is indicated.

The official notice to appear gives the applicant about 10 days for a final effort in his studies. Experience has shown at least 50 percent of all past failures have been due to inability to correctly answer the ten arithmetic questions in Section I of the examination.

To assist applicants for a license, a Real Estate Primer is available from the Real Estate Division at a nominal cost. The Primer can be used as study material in preparing for the examination.

While it is true that some examination questions may not be answered from material in the Primer, DO NOT BE ALARMED. The answers to approximately 90 percent of all questions will be found in the Primer.

THE DAY YOU APPEAR FOR YOUR EXAMINATION

Your notice for you to appear for your examination included the starting time. It will be to your advantage to arrive a few minutes

early. This will allow time for your materials to be assigned you and a few moments of relaxation.

You are again warned that you are not to perform any of the acts of a real estate salesman until after you have been notified that you received a passing grade and your salesman's license has been delivered to your broker.

The examinations are given in three Sections. Section I consists of mathematical problems typical of those confronting a real estate salesman in his daily work. The salesman's examination usually allows three points for each problem worked correctly. The number of points earned in this section has a strong bearing on the final grade.

Section II consists of questions on real estate law, real estate principles, practice and procedure, and definition of real estate terms used frequently. There are usually 50 questions of this type with credit of one point for each correct answer.

Section III requires the filling out of a Listing Agreement and an Earnest Money Receipt. In completing this section everything included in the problem must find a proper place in the document, but nothing is to be included that does not appear in the explanation.

The Board allows 18 points credit for a correct preparation of the Listing Agreement and the Earnest Money Receipt. Errors in either or both documents result in a reduction of points earned.

A two-point credit is given for excellence in spelling, writing and neatness.

The Board may change the format of the examination or the manner in which the examinations are conducted at any time when in its judgment the change is in the best interests of the Division, the licensee, or the general public.

EXAMINATION PROCEDURE

When you receive your examination papers, you will discover the only place your name appears is at the top right hand corner of the cover jacket. This portion of the jacket will be perforated and you will be instructed to remove prior to the time your completed papers are handed in. You will also observe a large red number on the cover jacket, which also appears on the first page of each section, and on the grade sheet. This number was assigned to your papers in the Salem office at the time the master eligible list was prepared. The master list is completed about ten days before the examination, and NEVER leaves the Salem office. With this system

7978

the applicant's identity, other than by number, is not revealed until the graded paper is returned to Salem. At that time the grades are transferred to the master list and you are then notified as to whether you passed or failed.

In the process of grading, all papers showing a grade of not less than 66 nor more than 74 are regraded by another Member of the Board. This is an extra precaution taken to avoid error.

A salesman applicant making a passing grade receives the necessary license application forms with the notification of his success. He must then procure the signature of his employer broker and return the forms to the Division with the necessary license fee. The license and pocket card will be immediately issued and forwarded to the employer broker.

If you did not pass the examination you will be promptly notified and will receive a written review of your grades by examination Sections.

If you receive a notice of failure we suggest, before you become too critical of the examination, the Board, or the Division, you review your own efforts in preparing for the examination. If you did not make a serious effort to study your grade may honestly reflect the amount of your effort. No advance information will be given by either the Portland or Salem office regarding your grade or whether or not the applicant failed or passed the examination. All such inquiries made either by letter, phone call or in person will be refused.

HOW MUCH TIME IS ALLOWED FOR THE EXAMINATION?

The time allowed to complete an examination has been pretty well established, but can vary as examination content and instruction may change.

At present all the examinations start promptly at 8:30 a.m. and must be completed at 3 p.m. As already pointed out, examinations consist of three sections. The time schedule by sections is 8:30 to 10:30 a.m.; 10:30 to 12:30 p.m.; one-half hour for lunch; 1 to 3 p.m.

Conversation is not permitted and the use of notes or references to texts is strictly forbidden. Dishonest practice of any kind will result in a non-passing grade, and may be grounds for denying future examinations.

QUESTIONS AND ANSWERS

7979

Some of the most frequently asked questions pertaining to examination procedures are answered here:

Q. If for any reason it is impossible for me to appear for my examination on the date I am eligible, will my name be placed on the list for the next examination?

A. Before your name can be placed on the list to take a succeeding examination, you must again file your application and remit a second examination fee of $10. The original fee was forfeited regardless of reason for failure to appear.

Q. I have been told if I fail two successive examinations I will not be permitted to take another examination for one year.

A. Your information is correct. The law provides that an applicant who fails two successive examinations shall be ineligible for another examination until the expiration of one year from the date of the last examination.

Q. If I fail my examination will I have an opportunity to review my papers with someone in the Division or with a Member of the Board?

A. No. Each applicant failing to make a passing grade receives a written review of his examination as soon as possible. The Members of the Board will not conduct personal reviews, and prohibit any member of the Division from doing so.

Q. I have been told there is a fund which the Commission may use for educational programs. Why isn't this money used to assist applicants in preparing for the examinations?

A. The law specifically provides this money can be expended for conducting educational meetings for the benefit of licensed real estate brokers and salesmen. An applicant has not qualified as a salesman until he has passed the examination and has been issued a salesman's license. The Commissioner has held, however, that applicants for a license may attend educational meetings if all of the available accommodations are not occupied by licensees.

Q. Will the Division forward to me copies of the examination papers which have been previously used?

A. No. Examination papers are confidential. The Board has ruled they be destroyed after each examination.

7980

Q. After I have completed the examination, may I work as a salesman until I have been notified that I either passed or failed?

A. No. The law provides that after passing the examination, neither a broker or salesman can work until he has received his license. It is suggested you review Rule 10-055 of the Rules and Regulations of the Real Estate Board.

Q. After I pass my examination, how long have I to pick up my license?

A. A successful broker or salesman examinee must pick up his license within one year from the date he wrote the examination. Failure to do so within the one year period will require the applicant to submit again to the written examination.

EXAMINATION QUESTIONS

Questions and arithmetic problems asked in the real estate examinations are typed on legal size sheets of white paper.

There are usually five questions on each single sheet, all of the sheets to each section being stapled together with side staples. Sufficient blank space is allowed below each question for the applicant to write in the answer. Pencils with erasers are supplied the applicants.

The arithmetic problems are typed on the examination sheets in the same manner. Usually two problems are shown on each sheet, although this may vary from time to time.

Below the typewritten problem, and to the right side of the page, a ruled box is provided for the answer to the problem. There is adequate blank space below each question for the necessary computation.

SAMPLE QUESTIONS AND PROBLEMS

A number of questions and problems similar to those used in examinations are found on the following pages of this Section. The questions and problems have been correctly answered, but the computation for the arithmetic problems is not shown. It could be excellent exercise to see if your computations produce the same answers.

QUESTIONS

Q. Is a charge for water furnished by the city a lien on real property?

A. No.

Q. A broker sells a $10,000 home on a contract of sale with a small down payment. Should the earnest money agreement provide for the furnishing of a purchaser's title insurance policy forthwith or at a later date when the buyer will have paid in a substantial amount on the purchase price?

A. Should be furnished at time of sale in order to protect both buyer and seller, no matter how small the down payment.

Q. What is a percentage lease?

A. A lease of property in which the rental is an amount equivalent to a stated portion of the receipts from the business conducted by the lessee.

Q. What is a party wall?

A. A dividing wall erected upon and over a line separating two adjoining properties and in which the owners of the respective parcels have common rights to its use.

Q. What is a life estate?

A. A freehold interest in land, the duration of which is confined to the life of one or more persons or contingent upon certain happenings.

Q. What is the maximum rate of interest that can be charged an individual on a real estate mortgage in the state of Oregon?

A. 10 percent.

Q. What is meant by the covenant of seizin?

A. A covenant of seizin is the grantor's guaranty that he is the owner of the property and has the power to convey title.

Q. What is meant by "curable depreciation"?

A. Any defect that can be cured. It is measured by the cost to cure.

Q. Is title by adverse possession just as valid as title by written instrument?

A. Yes.

Q. For what purpose is a deed recorded?

A. To give notice to the world.

Q. What is the legal rate of interest in Oregon?

A. 6 percent.

Q. If a purchaser assumes and agrees to pay a mortgage indebtedness, does that relieve the original mortgagor of the obligation? Explain.

A. No. He is liable for the debt until it is paid.

Q. A seller makes a counter offer which is refused by the purchaser. Can the seller then hold the purchaser to his original offer? Explain.

A. No. A counter offer cancels the original offer.

Q. A quit claim deed warrants and guarantees nothing. What is it used for?

A. To remove a partial or possible interest.

The questions in Section II of the examination consist of essay type, multiple-choice, or both. Samples of multiple-choice questions follow:

Q. The maximum rate of interest on a G. I. guaranteed loan is (a) 6%, (b) 8½%, (c) 7½%, (d) 4%.

Answer: b

Q. A quit claim deed is used to (a) bequeath property, (b) remove tenants, (c) pay assessments, (d) relinquish an interest.

Answer: d

PROBLEMS

7983

Q. On September 1, 1969, a house was insured against fire for 90% of its $24,000 value. The insurance rate was $.54 cents per $100 for a three year period. The house was sold February 1, 1971. What was the unearned premium to be charged the buyer?

Answer: $61.56

Q. What is the annual interest rate on an $8,000 loan when the interest payments are $80 per quarter on the full amount?

Answer: 4%

Q. A lot 65 feet wide and 150 feet deep sold for $7,670. What was the price per front foot?

Answer: $118

Q. The owner of a block of 14 building lots, each with a frontage of 75 feet, desires to realize $33,750 from the sale thereof, withholding, however, two lots for himself. What must be the sale price per front foot?

Answer: $37.50

Q. If John Doe purchased an apartment building for $40,000 and the total amount of the rents received was $6,000 annually, and the annual expenses totaled $2,000, what percent does his investment pay?

Answer: 10%

Q. A fire insurance policy was taken out for three years dated June 1, 1969, and premium paid for three years was $36.00. The property was sold January 1, 1971. How much would you prorate to the buyer?

Answer: $17.00

Q. The value of a frame house at the end of six years was estimated to be $7,650. What was the original cost of the house if the yearly rate of depreciation was 2½%?

Answer: $9,000

Q. What is the cost of a tract of land 264 feet wide by 660 feet deep at $800 per acre?

Answer: $3,200

7984

Q. If you contracted to sell the southwest quarter of the southwest quarter of the northwest quarter of a section of land, how many acres would be in the parcel sold? Assuming the larger square below to be one section of land, sketch in the location of the above parcel.

Answer: 10 acres

Q. 1 A property produced an 8% gross return on a $10,000 purchase price for a one-year period. The owner's only expense resulted from a 6% annual interest charge on a $9,000 lien against the property. What is the percentage of return the owner is realizing on his equity?

(A) 8%
(B) 10%
(C) 12%
(D) 26%

(Answer on Page 260)

REAL ESTATE - DEFINED AND REGULATED

Property is the right or interest of an individual in anything subject to ownership. Protection of this right or interest by society is a product of the free enterprise system.

Real Property is defined as the land, and generally, whatever is erected, growing upon, or affixed to the land.

Realty was formerly used to designate the land, but is now in common usage as a synonym for real property.

Personal Property is defined as everything that is the subject of ownership not coming under the domination of real estate. Personalty is frequently used to designate the thing itself.

The Legal Concept of Land is that it is not limited to surface boundaries, but that it extends upward to the sky and downward to the center of the earth.

Legal Rights arising in the ownership of real estate embrace possession, control, enjoyment, disposition, or right to do nothing at all.

Governmental Limitations on the ownership of real estate, enforced for the common welfare of the community, are police power, eminent domain, taxation and escheat.

Real Estate has two commonly accepted meanings as a result of commercial usage, although the words taken separately have historical origins in the ownership of property. The phrase is commonly employed interchangeably with realty and real property, and it is used to designate those persons engaged in commercial transaction or management of this commodity.

Administration of the Real Estate Division is under the supervision of the Real Estate Commissioner, who is appointed by the Director of the Department of Commerce and serves at his pleasure. He is charged with supervision of the activities of brokers and salesmen throughout the state, and has power to suspend or revoke licenses.

All correspondence relating to matters pertaining to the real estate division and the administration of the real estate law should be addressed to: REAL ESTATE COMMISSIONER, 158 12th Street NE,

7986

Salem, Oregon 97310.

The Oregon Real Estate Board consists of the commissioner and four experienced brokers appointed by the Director. Duties of the Board are: "to inquire into the needs of the real estate licensees of Oregon, the functions of the real estate division and the matter of the business policy thereof, to confer and advise with the Director as to how such division may best serve the state and the licensees, and to make recommendations and suggestions of policy to the real estate commissioner as said board shall deem beneficial and proper for the welfare and progress of the licensees and of the public and of the real estate business in Oregon." The Division is expressly authorized to make and enforce any and all reasonable rules and regulations deemed necessary to administer the provisions of the Act. Further, the Division may prepare and "circulate" among licensees such printed matter as it may deem helpful or educational.

In addition, the board is required to prepare questions for the examination of applicants for licenses, to conduct the examinations, grade the papers submitted by applicants and certify who have failed and who have passed.

Known as Chapter 696, Oregon Revised Statutes, Real Estate Brokers and Salesmen, the law has for its purpose:

To define the business of real estate brokers, associate brokers and real estate salesmen; to regulate and supervise the activities of all those engaged in real estate business as brokers, associate brokers and salesmen; to require those engaged in such business to have licenses; to provide methods for the suspension or revocation of such licenses in case of violation; to provide a real estate commissioner to administer the law and a real estate board to conduct the required examinations and act in an advisory capacity, all for the purpose of serving licensees, providing for their welfare and progress, with due regard for the welfare and interests of the public.

SOME EXPLANATIONS

Questions frequently asked of the Division pertaining to administration of the Act, together with the answers, follow:

Q. What is meant by the word "compensation" as used in the definition of real estate broker?

A. The word "compensation" means and includes any fee, commission, salary, money or valuable consideration for services rendered or to be rendered as well as the promise thereof and whether contingent or otherwise.

798

Q. Does the term "valuable consideration" as used in the definition of a real estate broker, mean only a money consideration?

A. No. A valuable consideration may consist of property, the rendition of services, the granting of a favor, or anything which the parties themselves or the law deems to be of value; even slight value, will be enough to constitute "valuable consideration".

Q. Does the term "real estate" as used in the Act refer only to the land itself, without improvements?

A. No. The term "real estate" includes all buildings, fixtures and improvements attached to the land, and includes standing timber.

Q. What is meant by the term "associate real estate broker"?

A. An associate real estate broker is a person who has qualified as a real estate broker, who works for a designated broker and whose license states he is associated with a designated broker.

Q. What is meant by the term "real estate salesman"?

A. A real estate salesman means any person, who, for compensation or in the expectation or upon the promise thereof, is employed or engaged by a licensed real estate broker to do any act or deals in any transaction listed in the definition of a "real estate broker" for or on behalf of such licensed real estate broker.

Q. Does the word "person" as used in the Act include within its meaning individuals, firms, co-partnerships, associations and corporations?

A. Yes.

Q. How many acts as a real estate broker or as a real estate salesman will require a person engaged in such activity to take out a license?

A. One.

Q. Is it unlawful to carry on or hold one's self out as a real estate broker or salesman without having a license?

A. Yes. The Act prescribes severe penalties for the unlawful practice of real estate.

Q. What are the penalties for violating the provisions of the Real Estate Broker's License Act?

A. Upon conviction, for a first violation, a fine of not less that $200 nor more than $500 or by imprisonment for a term not exceeding ninety days or by both such fine and imprisonment; for a second or subsequent violation, a fine of not less than $500 nor more than $1,000 or by imprisonment for a term not exceeding two years or by both such fine and imprisonment. Such violation would be considered a misdemeanor.

Q. 2 The "legal concept of land" is that it is:

(A) capable of being inherited
(B) not limited to surface boundaries, but extends from the sky to the center of the earth
(C) heterogenous, incapable of being moved and limited in quantity
(D) a statement identifying location and boundaries

Q. 3 What does the term "improvements" mean in a real estate transaction?

(A) everything except the land
(B) additions to property since last sale
(C) fixtures and personal property
(D) streets, curbs, sidewalks and utilities

LAND DESCRIPTIONS

ORIGIN OF SURVEYS

Under the constitution of the United States, all real property located within the boundaries of the original Thirteen Colonies became the property of the state when the colony became a state. This left no public land within the boundaries of the original colonies.

All of the property of the Thirteen Colonies was described by "Metes and Bounds." This means that the legal description was by direction and measurement from some designated starting point. The starting point was called a "monument." Many of the early descriptions had as their starting point the foot of a mountain, the bank of a stream, or, in some cases, even a tree or stump. Later this often gave rise to disputes and difficulty in determining the boundaries of a property.

As additional land was acquired by the government it was necessary to prepare for settlement tracts which were known as "public lands." These public lands had to be divided up into suitable parcels for sale and homesteading.

In 1784 the Continental Congress appointed a committee to devise a system of land measurement. The first plan called for the dividing of the public lands into tracts that were 10 miles square. These tracts were further divided into 100 smaller parcels one mile square. The tracts were numberer from 1 to 100 beginning in the Northwest corner and numbering to the East then back West. This system was used to some extent in Virginia but did not meet with wide acceptance.

In 1785, Thomas Jefferson suggested to the Continental Congress that the unit of measurement be a block of land six miles square. These new units were called "Congressional Townships" but later became known as just townships. The units were further divided into sections one mile square. The sections were numbered beginning at the Southeast corner and numbered West and back to the East. This was later changed to begin the numbering at the Northeast corner and numbering West, then back East. This procedure has continued up to the present time.

THE RECTANGULAR SYSTEM

The present system known as the "Rectangular System" was adopted in 1805. This system was first used in the Northwest Territory. Most of the land west of the Mississippi River was surveyed in this way with the exception of Texas. The surveying of the public lands was done by the General Land Office of the Government.

In making any survey it is necessary to have a "starting point." By an act of congress in 1850, the Surveyor General of the territory of Oregon was required, on the order of the Secretary of the Interior, "to cause a base line and meridian to be surveyed, marked and established, in the usual manner, at or near the mouth of the Willamette River." Following this order the territorial Surveyor General established for the States of Oregon, Washington, and Idaho a north and south line called the Willamette meridian, and an east and west line called the base line. These lines intersect at a point in Multnomah County, Oregon, about three miles west and slightly north of the present county court house in that county. The Willamette meridian extends from the northern border of California to the southern boundary of Canada. The base line extends from the Pacific Ocean into the state of Idaho, but not completely through the state.

Lines are surveyed every six miles parallel to both the Willamette meridian and the base line. The lines parallel to the meridian mark off the land into strips 6 miles wide. These strips are known as "ranges" and are numbered east or west of the Willamette meridian. The lines parallel to the base line at six mile intervals cut the ranges into squares known as "townships." These townships are numbered beginning with 1 both north and south of the base line. A description of a township might read "township 5 north, range 2 west of the Willamette meridian and base line."

Because the earth is curved, the north and south lines become closer together as they proceed north. This means that the six mile blocks are not exactly square. Therefore, each township does not contain a full 36 square miles. This variation at the north end of each township is approximately three rods or 49½ feet narrower at the north end than at the south. In order to keep the meridian lines as near 6 miles apart as possible a "correction line" or jog is made every 24 miles as the line continues north. The survey is moved over so that the lines are again 6 miles apart.

After a township has been surveyed, the sections are numbered beginning at the northeast corner and numbering west and then back until all of the 36 sections are numbered. It is evident from the above discussion that not all of the sections would contain a full 640 acres. The survey is usually made north and south from the base line and east and west from the prime meridian, the tier of sections on the north side of a township, north of the base line, would be compressed to less than a full section. The same would be true of the tier on the west side of the township. Rather than make each section less than 640 acres all of the discrepancy is taken out of the eleven sections known as "fractional sections." (See illustration.) Each township is made up of 25 full sections and 11 fractional sections.

Township

N

6	5	4	3	2	1
7					
18					
19					
30					
31					

Sections in a township in which fractional eighths appear. Namely Sec. No. 1-2-3-4-5-6-7-18-19-30-31

These fractional sections on the sides of a township are surveyed so that the sections from 1 to 6 of all sections north of the base line have a full 320 acres in the south half of the section. Then the north half is then divided so that the south one-half of the northeast quarter contains a full 80 acres. The same is true of the south half on the northwest quarter.

This leaves the N. ½ of the N. E. ¼ and the N. ½ of the N. W. ¼ as being the units that have less than a full 80 acres. In sections 6, 7, 18, 19, 30, and 31 the deficit is placed in the west half of the section instead of the north half. Since section 6 has two deficits levied against it, the result is that only the S. E. ¼ is a full quarter section unless the deficit is allocated in some other way. In practice surveyors attempt to establish as many full 80 acre tracts in a section as possible. The description of the deficit portions given above applies only to townships which are north of the base line and west of the Willamette meridian. Those east of the meridian and south of the base line would change according to their relation to the prime meridian and base line.

Since the numbering of the sections always begins at the northeast corner this section is always numbered 1. The numbering then proceeds to the west so that the last section in the tier is number 6 and the section directly below it is number 7 and the numbering proceeds back to the east, so that the last section in the southeast corner of a township is always number 36.

The sections can also be divided into halves, called the north and south halves or the east and west halves. The halves can be further divided into quarters called the northeast, northwest, southwest and southeast quarters. These quarters in turn can be divided as far as necessary.

The rectangular system therefore affords a comprehensive and complete system for the prompt location of any land in an area. It also makes it possible to divide up parcels or combine them at will.

5,280 Feet

METES AND BOUNDS DESCRIPTION

In a metes and bounds description the piece of land is described by giving its boundaries. If natural objects such as trees, streams, or stone monuments are used to form the boundary no attempt is made at an accurate measurement as to distance and angles. This is called an informal survey. The same piece of land bounded by a description from accurate measurements made by surveying instruments is called a formal description.

The first requisite of a metes and bounds descriptions is a definite and stable starting point; for example, the intersection of the center lines of two streets. The boundary lines must be run continuously from one point to another, returning to the starting point, so as to produce a closed area. A description which fails to enclose a tract of land is fatally defective.

From the point of beginning the description recites the course or direction and the length of each succeeding boundary line. The course is stated by giving the bearing of the line. The bearing of a line is its angular deviation measured in degrees, minutes and seconds from, as a rule, a true north and south line. Visualize a circle, whose circumference contains 360 degrees, with each degree composed of 60 minutes of 60 seconds each. Divide the circle in four (4) equal parts by a line running north and south and a line running east and west through the center of the circle.

The north and south line has a bearing of 0 degrees, the east and west line bears 90 degrees. With the point of beginning at the intersection of the two lines, the bearing of the course is described by measuring easterly or westerly from the north and south

line to a maximum of 89°, 59′, 59″. Thus, if the direction of a line measures 30 degrees from north towards east, the bearing of the line is stated as "North 30 degrees East" or merely "N. 30° E." If the angular deviation is greater than 90°, the measurement is not given, for instance, as 135° but as 45° east of south or "S. 45° E."

The length of the line whose bearing has been given is then added and this completes the description for that particular line. This is repeated for each new line until the point of beginning is again reached and an enclosed area is described.

An example of a metes and bounds description is:

That portion of the SW¼ SW¼ of Section 32, Township 7 South, Range 3 West, Willamette Meridion in the County of Marion, State of Oregon.

Beginning at the intersection of the center lines of "A" Street and Oak Avenue, the real point of beginning; thence

North 45 degrees 00 minutes East (N. 45° 00′ E.) 640 feet to a point; thence

North 30 degrees 00 minutes West (N. 30° 00′ W.) 480 feet to a point; thence

South 65 degrees 20 minutes West (S. 65° 20′ W.) 640 feet to a point; thence

South 34 degrees 04 minutes 56 seconds East (S. 34° 04′ 56″ E.) 658.57 feet to the point of beginning.

To all metes and bounds descriptions, either formally or informally surveyed, should be added the name of the county and the city, if it is within the limits of a city.

RECORDED PLAT DESCRIPTIONS

Much agricultural land has been subdivided in recent years for building purposes. The requirements for such subdividing are given under the topic of Plats and Subdivisions. After a plat has been recorded it is only necessary for a legal description to refer to the recorded map and the name of the subdivision. Since the lots are numbered and the blocks numbered or named a legal description might read:

Lot 5, Block 1 of the Hilldale Tract, City of Portland, County of Multnomah.

In some cases a lot plus a part of another lot might be for sale, both parcels having an easement for an alley. The legal description for this sale might read:

All of Lot 5 except the northerly 15 feet, dedicated for alley purposes, and the easterly 10 feet of Lot 4, except the northerly 15 feet, dedicated for alley purposes, all in Block 1, Hilldale Tract, City of Portland, County of Multnomah.

Table of Land Measure

Linear Measure

1 link	=	7.92 inches
1 rod	=	25 links, 16½ feet, 5½ yards
1 chain	=	100 links, 66 feet, 4 rods
1 mile	=	5,280 feet, 320 rods, 80 chains

Square Measure

1 acre	=	160 sq. rods, 10 sq. chains
1 section	=	640 acres
1 sq. mile	=	640 acres
1 township	=	36 sq. miles

Legal Description of Land

How important is a legal description of land? Perhaps this question should be asked more frequently by those of us who deal in real property.

When land is purchased or sold it is necessary that it be accurately and clearly described. There can be no doubt in the minds of either the seller or purchaser as to the tract of land to be conveyed. Yet too often it is considered as merely a matter of filling out a printed form, especially in listing agreements or earnest money receipts.

Land is unlike any other commodity in that it is lacking in segmentation or natural divisions. It comes to us a mass of area upon which we must make artificial divisions or boundaries. Only when land is completely enclosed by such boundaries can it be properly described.

The sufficiency of the description is most important and upon its accuracy will depend the success or failure of a real estate transaction. There are of course the three basic methods of describing real property, namely—

1. Metes and bounds descriptions.
2. Government rectangular survey system.
3. Lot and block or recorded plat method.

In addition to the above basic methods of describing real property there are in use other types of descriptions, which when used may be sufficient but are fraught with danger. Many times reference is made by street number, tax lot number or some other method of describing a parcel in an informal manner. Each of these latter methods may describe the premises sufficiently to be good as between the parties but insufficient to properly indentify the boundaries with reference to adjacent lands.

The most common practice of describing the subject property in an informal manner is through the use of the street address. It is true that in many instances the property can be identified but not with certainty. In urban areas where street addresses are used with frequency many properties lie in two or more separate or distinct recorded plats.

Another situation which often occurs is that of a parcel of land which has been acquired by the owner by two or more purchases. The property being sold may consist of a main parcel to which has been added at a later date a garden tract or other parcel, perhaps containing valued improvements. In checking the assessor's records to ascertain the correct legal description it frequently happens that only a portion of the premises are identifiable from the street address. It should be remembered that street addresses are assigned on the basis of 50′ parcels and a given street address may only identify a portion of the premises. If it is necessary to use a street address then most definitely the dimensions of the tract should be specified. This will enable the title company to check the description with some degree of certainty.

The use of the tax lot number should also be approached with caution. A tax lot number is an assigned number principally for the convenience of the assessor which will enable his office to identify a particular parcel. This number is identified further on the records of the assessor by a metes and bounds description. Because it is a number for the assessor's convenience it at times changes, especially if a smaller tract is carved out of a larger area. For this reason the use of a tax lot number to identify the parcel should be combined with a reference to the particular year the tax lot number appears on the assessment roll. If this is not done the result may be a conveyance of an entirely different parcel of land than that which was intended to be conveyed.

At times reference is made in an earnest money receipt to all of the seller's land in a particular area. Such reference has been upheld by our courts if the land can be identified with certainty. It may require a lawsuit to do so and for this reason this type of description should not be used. An example of such a situation leading to confusion was the subject of an Oregon Supreme Court decision wherein the court refused to uphold an earnest money receipt which called for the sale of seven lots owned by the seller on a particular street. Because he owned eight lots on that street the court held there was no contract because the seven lots could not be identified with certainty.

A more recent decision, decided in May of 1964, involved an earnest money receipt which contained the following description:

"Residence and property belonging to Susan Lehman located at 3805 N. W. Saltzman Road, Portland 10, Oregon. Said property consists of approximately 39 acres and fronts on two sides of N. W. Thompson Road and one side by Saltzman Road. Legal description to follow."

The court had this to say:

"The seller's land at the location in question actually contained slightly more than 46 acres. The trial court could not discern from the agreement which 39 of those acres the parties intended to buy and sell. Neither can this court.

"The post office address (3805 N. W. Saltzman Road, Portland 10, Oregon) adds nothing to the description when the land to be sold a part of a larger tract generally sharing the same postal address. Three physical boundaries (N. W. Thompson Road on two sides, and Saltzman Road on one side), which ordinarily would be of some value in identifying the land to be sold, in this case apply as well to the entire tract. The approximate acreage is a clue to the intent of the parties, but in this case the question remains, what 39 acres?"

A reference to a recorded document such as a deed or mortgage which contains a correct legal description is an acceptable method of describing a particular parcel.

Every effort should be made to ascertain the correct legal description. If such description cannot be obtained at the time of listing a parcel for sale, most certainly it can be obtained in most cases before it becomes necessary to include the description in an earnest money receipt. The owner has his records and documents from which the description can be ascertained, or lacking this your title insurance company will be most happy to obtain the correct legal description—this extra precaution may save a deal or a lawsuit.

ENTRY ON LAND FOR U. S. EXPLORATIONS AND SURVEYS

Oregon law provides that "any person employed in the execution of any survey authorized by Congress may enter upon lands in Oregon for lawful objects, and may establish permanent station marks, and erect signals and temporary observatories."

This person must pay or tender compensation to the owner. If they cannot agree on the compensation the county court will assess the damages.

Q. 4 An area of 24 square miles is divided into how many townships?

BASIS OF REAL PROPERTY LAW

When we speak or think of "property" we usually have in mind the thing itself - an automobile or a parcel of land. Technically, and in a legal sense, however, the word does not mean the thing owned, but refers to the right or interest that a person has in the thing he owns. These rights include the right to possess, to use, to encumber, and to dispose.

It has often been said that there are as many interests in land as there are leaves on a tree. It is impossible to visualize the numerous and varied interests which can be held in the title to real property. Such interests are at times well defined and at other times are subject to much conjecture, and frequently do require the interpretation of our courts.

COMMON LAW EXPLAINED

Determination of rights in land in Oregon depends upon both the "Common Law" and "Statutory Law".

"Common Law" is contrasted with and opposed to "Statutory Law". As used in this state, "Common Law" comprises the body of those principles and rules of action relating to the government and security of persons and property which do not rest for their authority on any express and positive declarations of the will of the legislature. In other words, "Common Law" will prevail in Oregon unless such law has been abrogated by statutory law.

Interpretations of "rights", "interest" and "estates" in land is not only interesting, but also exacting. The rights acquired by single persons, married persons and groups of persons are referred to as fee simple estates, tenancies by the entirety, tenants in common, joint tenants, and tenants for life in common with the right of survivorship, and must be resolved beyond a reasonable doubt.

The extent of such rights depends upon an accurate interpretation of various legal documents in the "chain of title", such as deeds, wills, leases, suits, etc., in relation of either statutory or common law. For the real estate practitioner this service is usually performed by the title insurance company when it issues a policy insuring the ownership of an interest in real property.

ACTIONS AT LAW

116 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

Oregon law requires that actions shall be commenced and tried in the county in which the subject of the action, or some part, is situated if it is an action for the recovery of real property, or an estate or interest therein, or for injuries to real property; for the partition of real property; foreclosure of a lien or mortgage upon real property; for the determination of an adverse claim, estate or interest in real property, or the specific performance of an agreement in relation thereto.

SOME DEFINITIONS

Judgment is the final determination of the rights of the parties in an action or special proceeding.

Decree is the final determination of the rights of the parties to a suit.

Order is any intermediate determination.

Line and Partition Fences

Under Oregon law an owner of land who makes use of a line fence already erected by his neighbor to enclose his own property becomes liable to the neighbor for one-half the value of the partition fence. Both parties are then liable for the repair or rebuilding of the partition fence.

If either of the parties think it proper to vacate his part of the inclosure he is at liberty to do so by giving the other party six months written notice. The second party can prevent removal of the partition fence if, within two months, he pays a sum agreed upon by the parties or arrived at by arbitration.

When any person builds, by mistake and in good faith, a fence on the land of another, he may go upon the land of the other to remove the fence at any time within one year. The owner of the land on which the fence was mistakenly erected cannot remove or destroy the fence during the one year period.

Enforcement of Judgments and Decrees
Executions and Exemptions

EXECUTIONS

We are familiar with the fact that there are but two ways to transfer title to real property during the lifetime of an owner thereof. These are by voluntary and by involuntary sales, both of

which are discussed under other headings in this Primer. Involuntary sales are made pursuant to statutory or judicial authority and generally are without the co-operation or consent of the owner, hence the designation of "involuntary". Such sales are usually the result of disputes, neglect, financial reverses, or the incapacity of the owner to act.

An execution sale is made by an officer of the law pursuant to power conferred by the statute and differs from a judicial sale, which is made by the court or by an agent of the court.

A "writ of execution" may be construed as a command to execute the judgment of the court.

Present day writs of execution are issued by the clerk of the court and directed to the sheriff. Such writs require the sheriff to first satisfy the judgment "out of the personal property of the debtor or if sufficient personal property cannot be found, then out of the real property belonging to him on the day when the judgment was docketed in the county or at any time thereafter". A purchaser at such sale does not necessarily get a marketable title free from liens or encumbrances. The adequacy of the sale and the title which the purchaser receives depends upon the sufficiency of the judgment. A judgment is always the result of a law suit. In order to have a valid and binding judgment, it is necessary to procure proper jurisdiction over the defendant. That is, he must be properly served with summons in order that he be afforded the opportunity to defend the suit. He is entitled to his day in court.

Assuming that service is sufficient, that the defendant has had his opportunity to defend, then the purchaser will receive the title that the judgment debtor had. Such title may be free and clear or it may be subject to liens, encumbrances and defects. The purchaser will take title subject to all such prior liens against the premises.

The title in the purchaser is further subject to the right of redemption of the previous owner or judgment debtor. Also, the right of redemption of any junior lien holder whose lien may have been cut off by the execution sale. The right of redemption of the owner is for a period of one year from the date of sale. That of junior lien holders, sixty days from either the date of sale or from the date of the last redemption.

SECURED, UNSECURED JUDGMENTS AND ATTACHMENTS

In the foregoing we discussed execution sales in general. Such sales follow the entry of a judgment which is the result of suit either

for damages or for the recovery of a debt. Judgments fall into two groups, secured and unsecured.

Secured judgments are the result of the foreclosure of a mortgage or other lien or the final determination of an action wherein specific property has been attached. A decree of foreclosure of a mortgage or lien or the final judgment based upon an attachment will provide that the real property be sold to satisfy the debt.

Such execution sales are referred to as special executions simply because they are directed to a specific parcel of real property. Otherwise the procedure is the same as a sale under a general execution sale.

In the foreclosure of a mortgage or other lien, it is necessary to join all junior lien-holders who may claim a lien on the specific property. Jurisdiction must be procured over each of these defendants in order that they may have the right to contest the validity or priority of the lien being foreclosed. The decree is for a sum of money with a special direction that specific property be sold to satisfy the judgment. If the proceeds of sale are insufficient, then the remaining debt, or deficiency may be satisfied as a general and unsecured lien against other property owned by the defendant.

A judgment based upon a foreclosure of a lien or upon an attachment dates back to the date of recording the lien or the filing of the attachment, and has priority over any subsequent liens or encumbrances against the specific property. Otherwise the priority of a judgment is determined by the date of its entry in the judgment docket. A sale under execution will cut off the rights of subsequent or junior lien-holders, other than their statutory right of redemption, without notice.

MOBILE HOME EXEMPTION

Any mobile home which is the actual abode of a judgment debtor shall be exempt from execution in the amount of $3,000.

HOMESTEAD EXEMPTION

A homestead shall be exempt from sale or execution from the lien of every judgment and from liability in any form for the debts of the owner to the amount in value of $7,500. The property must be the actual abode of the debtor. The exemption extends to the proceeds of a sale to the value of $7,500, which may be held for one year with the intention to procure another homestead.

If located in a town or city the homestead shall not exceed

7997

one block, and if not in a city or town, not more than 160 acres. The claim of homestead may be made at any time prior to sale of the property. If the homestead cannot be blocked out, the property is sold and $7,500 turned over to the homestead claimant. The exemption does not apply to mechanics' liens, purchase money liens and mortgages lawfully executed.

Actions and Suits Involving Property Rights

Oregon law permits any person who has a legal estate in real property and a present right to the possession thereof, to recover possession of the property, with damages for withholding possession, by an action at law.

Examples of "unlawful holding by force" are a tenant in possession who fails or refuses to pay rent 10 days after it is due, or fails to deliver possession after being in default 10 days; or after a lease has expired; or a tenant holding from month to month, or year to year, and remaining in possession after notice to quit; or is holding contrary to a condition of the lease, or is holding without a written lease.

ABATING A NUISANCE

Any person whose property or personal enjoyment thereof is affected by a private nuisance, may maintain an action at law for damages therefor.

If an order is issued, the sheriff will be directed to abate the nuisance, and the expense will be levied against the property of the defendant.

Ten residents of a single precinct in a county of 50,000 or more inhabitants may petition the county commissioners to conduct a hearing relative to an alleged nuisance. If the plaintiffs' position is upheld, the county commissioners shall bring a suit for abatement.

SUIT TO ESTABLISH BOUNDARY

Where any dispute or controversy exists between owners of adjacent or contiguous lands in this state, concerning the boundary lines or the location of the line dividing such lands, either party may bring a suit in equity in the circuit court in the county where all or part of the lands are situated, for the purpose of having the boundary line or dividing line ascertained and marked by proper monuments.

The determination shall be made by three disinterested commissioners, one of whom shall be a practical surveyor.

INJURY BY CHANGE OF GRADE

Both the State Highway Commission and the county are liable under Oregon law for any legal damage or injury to any real property abutting upon a public road affected by a change of grade. Just and reasonable compensation shall be made in accordance with the rules of eminent domain. Such an action must commence within six months after the change of grade is completed and accepted.

ACTION FOR WASTE

If a guardian or tenant in severalty, or in common, for life or for years of real property commits waste thereon, any person injured thereby may maintain an action at law for damages against the guardian or tenant. In the action there may be judgment for treble damages.

If the waste was committed with malice, forfeiture and eviction can be given in favor of the person entitled to a reversion against the tenant in possession.

CUTTING TREES

In a very broad Oregon statute, any person who injures or removes from the lands of another, public or private, any produce, trees or shrubs is liable for treble the damages claimed. If this trespass was casual or involuntary, judgment shall be for double damages.

Partition of Real Property by Suit

One of the little known methods of involuntary sale of an interest in real property is through the medium of the partition suit.

Partition is by judicial proceedings at the instance of one or more of the co-tenants without regard to the wishes of the other co-tenants. It is a statutory procedure and the provisions of the code must be strictly complied with.

The method of sale or the elimination of an interest in real property through partition may be accomplished in several ways. Basically the complaint asks for partition of the premises; that is,

it asks for a physical partition setting off to the participants a portion of the premises in accordance with the quality and quantity of their respective interests, as determined by the referees appointed by the court.

If actual physical partition is had, it is accomplished by three referees, who are to determine the portions to be set off. They may employ the services of a surveyor to assist them.

If, in the opinion of the court, partition cannot be made without great prejudice to the owners, then the court may direct a sale of the whole or a part thereof. In the event a sale is directed, the court may appoint one or more referees to conduct the sale. All sales made by the referees shall be made at public auction to the highest bidder in the same manner required for the sale of real property on execution.

Any one of the parties to the suit, either the plaintiffs or defendents, may purchase the whole or part of the premises when sold. Only the referees or a guardian representing an infant in the suit are precluded from being a purchaser.

The act also provides a protection to those who object to either a partition or sale of the premises. If, in the opinion of the court, the property can neither be partitioned nor sold without great prejudice to the owners, the courts may receive evidence as to the value of the respective interests, fix the value thereof, and make an order permitting the owners objecting to the partition or sale, to borrow money on the property with which to pay off the claims, as so fixed, of the persons demanding a partition or sale.

Probate Sales of Real Property

To the uninitiated or uninformed, some of the methods of selling real property seem to be cumbersome and without merit. One of these procedures is that of the probate sale of real property in a decedent's estate. The right to sell such property is a statutory procedure; it can only be sold for the specific purpose provided for by statute. The sale is conducted by the executor or administrator and has some of the attributes of an involuntary sale, because the executor or administrator, who does not own the property, sells the interest of another in real property.

Title to real property vests immediately in the heirs or devisees upon the death of the decedent, subject, however, to the right of the executor or administrator to sell the property.

The right to sell is defined by Oregon statutes, and such sales may be made for the following purposes only:

1. For the purpose of paying the charges, expenses and claims against the estate.
2. When it shall appear to the satisfaction of the court that it would be for the best interest of the heirs, devisees and legatees that the property be sold for the purpose of distribution.

Bankruptcy and Real Property

The sale of real property by an executor or administrator has already been discussed. Another type of sale by an official of the court is a sale in bankruptcy.

The object and purpose of the bankruptcy law is two-fold: First, it is for the purpose of accomplishing a prorate distribution of the bankrupt's assets among his creditors; second, to secure to the bankrupt immunity from further liability for his debts by granting him a discharge which shall be a bar against any legal proceedings.

The right to adjudicate a person a bankrupt and to administer his assets is exclusively under the jurisdiction of the United States District Court for the District in which he resides.

PETITION FIRST STEP

The proceedings to declare one bankrupt are initiated by petition either voluntarily by the bankrupt or involuntarily upon petition by his creditors. After a hearing, if circumstances warrant, he is declared a bankrupt and an order adjudicating him as such is signed. After such adjudication a trustee is appointed to administer the assets. Immediately on his appointment, the trustee is vested by operation of law with title to all the property, wherever situated, owned by the bankrupt at the time of filing petition.

It is the duty of the trustee to collect the assets of the estate as quickly as possible and to dispose of them to the best possible advantage in order to realize an equity for the creditors. The trustee is under no obligation to accept property which would burden rather than benefit an estate. He may refuse to accept such property, subject to the approval of the bankruptcy court, and the effect of his rejection would be to revert title back in the bankrupt.

SALE PROCEDURE

The procedure for sale of real property is relatively simple and may vary somewhat in each jurisdiction. Usually the trustee obtains an order for sale. After notice to creditors, a hearing is had, after which the trustee makes his report of the sale and petitions

for an order of confirmation. Upon the confirmation being granted, the trustee executes a deed to the purchaser.

This is the procedure for sale, but the purchaser does not necessarily receive a valid title. Such a sale is subject to all liens, encumbrances and defects against the title.

LIENS NOT VOID

There are some mistaken theories as to the effect of bankruptcy upon judgment liens against the bankrupt. It is often said that a judgment lien obtained within four months of the petition for bankruptcy is void. A judgment lien obtained during this four month period is merely voidable and not void. The bankruptcy court may declare such a lien void if it finds that, at the time such lien was obtained, the bankrupt was insolvent, or if such lien was permitted in fraud.

The lien of the judgment is not extinguished by the bankruptcy but only the remedy. Therefore, if the bankrupt wishes to sell or mortgage at a later date, he must procure a release of the judgment or wait until the lien is extinguished by operation of law.

Secured lienholders, such as mortgagees, are not free to pursue their remedy of foreclosure against a bankrupt without first obtaining permission to do so from the bankruptcy court.

Limitations of Actions and Suits

STATUTE OF LIMITATIONS

Actions at law shall only be commenced within the periods prescribed, except when a different limitation is prescribed by statute.

An action shall be deemed commenced when the complaint is filed and a summons served.

SOME LIMITATIONS

An action for the determination of any right or claim to, or interest in, real property, or the recovery of possession of real property shall be commenced within 10 years.

No mortgage upon real property shall be a lien upon such property after the expiration of 10 years from the date of maturity. After 10 years the mortgage shall be presumed paid and discharged.

This limitation is voided when (1) any portion of the mortgage debt or interest has been voluntarily paid within 10 years of beginning of the suit (2) the original mortgagor still owns the mortgaged property (3) and no lien or right of a third person has attached to the property after the expiration of the 10 year period.

Actions on judgments or sealed instruments must be commenced within 10 years.

A judgment remains valid and a lien on real property for 10 years after entry. It may be renewed by the circuit court.

LAND CONTRACTS

Suit or action to enforce a contract for the sale of real property must be instituted in the county in which the real property is situated within 5 years from the date of maturity of the final payment provided for in the contract. After that period it ceases to be a lien, encumbrance or cloud on the title of the property.

OTHER LIMITATIONS

Actions for waste or trespass upon real property must be commenced within 6 years.

An action upon a contract, express or implied, excepting those listed herein - 6 years.

An action for taking, detaining or injuring personal property, including an action for the specific recovery thereof - 6 years.

An action upon a statute, except for penalty or forfeiture - 6 years.

An action upon a statute for penalty or forfeiture - 3 years.

An action for any injury to the person or rights of another, not arising on contract, and not especially enumerated - 2 years.

An action for libel or slander - 1 year.

For any felony, other than murder or manslaughter, within 3 years of its commission.

For any misdemeanor - within 2 years of its commission.

Uniform Commercial Code

8003 4008

Oregon statutes relating to "bulk sales", "conditional sales" and "chattel mortgages" were repealed on September 1, 1963, when the Uniform Commercial Code became effective.

The Code gave us a new set of terminology. Conditional sales and chattel mortgages have become "security agreements". Security agreements are used when it is intended to create a security interest in goods, documents, installments, chattel paper, accounts or contract rights.

Real estate practitioners have an interest in this section of the Code because security agreements will be used when "fixtures", "growing crops" or "standing timber" is used as security for a loan.

A person claiming security upon such goods must file a "financing statement" with either the County Clerk or Recorder. The parties to the financing statement are the "debtor" and the "second party".

The lien created by the filing, if for five years or less, is effective until the maturity date, and thereafter for a period of 60 days. If no maturity date is given, the lien is effective for a period of five years. The execution and filing of a "continuation statement" will extend the lien for an additional five-year period. Most transactions under the Code will be filed with the Secretary of State and the county in which the debtor resides.

Bulk Transfer Law

Most real estate brokers will have occasion to make sales which involve the sale of a going business. Those brokers who do this only occasionally are apt not to be familiar with the procedure required by the Bulk Transfer section of the Uniform Commercial Code.

The Bulk Transfer law provides that it is the duty of every person buying any commercial business or establishment, including restaurants and other food dispensing establishments, or of all, or substantially all, of the furniture, fixtures, supplies, or equipment of any such business or establishment, to demand the receive from the seller an affidavit containing the names and addresses of all of the creditors of the seller, together with the amount of the indebtedness due to each creditor. It is the duty of the seller to furnish such a statement.

The buyer must preserve the affidavit for six months following the sale and permit inspection by any creditor of the seller, or he may file the affidavit in the office of the county clerk in the county in which the seller's place of business is located.

The law further provides that after a purchaser receives the

affidavit, and at least 10 days before the closing of the sale, the purchaser must notify personally or by registered letter, each of the creditors of the seller named in the affidavit, of the proposed purchase. The contents of the notice are prescribed by law. The reason for this notice is to give to all such creditors listed the opportunity to attach the assets of the business prior to the consummation of the sale.

The law further provides that in any case where there is a purchase of personal property coming within the purview of the Act, without receiving such affidavit and without notifying the creditors listed in the affidavit, if any are listed, the purchase shall be ineffective as to any creditor who has not been notified. In other words, unless this procedure is followed as required by law, the purchaser does not acquire good title to the assets of the business, and the assets of the business are subject to being attached for the payment of debts owed by the seller.

The purpose of the Bulk Transfer law is to prevent fraud, to protect creditors, and to make the matter of the sale known to creditors. In the event of a violation the sale is presumed to be fraudulent and void as to existing creditors.

It is quite obvious that in the event any business establishment is being sold, regardless of the nature of the business which is being conducted, the law should be strictly complied with; and if a broker is closing a transaction, even though there is included in the transaction, in addition to the assets of the business, the real property on which the business is located, it is the duty of the broker to see to it that this law is strictly complied with.

No action shall be brought nor levy made under the Bulk Transfer law more than six months after the date on which the buyer took possession of the goods, unless the sale has been concealed. If the transfer has been concealed, actions may be brought or levies made within six months after its discovery.

If the intended sale is to be made at public auction, in addition to information required for ordinary bulk transfer, the notice must state that the sale is to be by auction, the name of the auctioneer, and the time and place of the auction.

In an auction sale, the responsibility for giving the statutory notice is the auctioneer's. A sale which violates the requirements does not render the transfer fraudulent and void, but the auctioneer becomes personally liable to the transferor's creditors.

Discrimination in Selling, Renting, or
Leasing Real Property Prohibited

An important Oregon law from the standpoint of the real estate licensee is ORS 659.033, which reads as follows:

(1) No person engaged in the business of selling real property shall solely because of race, color, religion or national origin of any person:

(a) Refuse to sell, lease or rent any real property to a purchaser.
(b) Expel a purchaser from any real property.
(c) Make any distinction, discrimination or restriction against a purchaser in the price, terms, conditions or privileges relating to the sale, rental, lease or occupancy of real property or in the furnishing of any facilities or services in connection therewith.
(d) Attempt to discourage the sale, rental or lease of any real property to a purchaser.

(2) No person shall publish, circulate, issue or display, or cause to be published, circulated, issued or displayed, any communication, notice, advertisement or sign of any kind relating to the sale, rental or leasing of real property which indicates any preference, limitation, specification or discrimination based on race, color, religion or national origin.

(3) No real estate broker or salesman shall accept or retain a listing of real property for sale, lease or rental with an understanding that a purchaser may be discriminated against with respect to the sale, rental or lease, thereof, solely because of race, color, religion or national origin.

(4) No person shall assist, induce, incite or coerce another person to commit an act or engage in a practice that violates this section.

Husband and Wife Property Rights Relationship

While many American women were picketing the White House in the early 20's, and others were parading to promote their cause for equal suffrage, the women of Oregon were going to the polls alongside their menfolk and casting ballots.

Oregon gave women the right to vote in the election of November 8, 1912, by a margin of above 5,000 to 3,000 votes.

Since that time this state has frequently taken steps to see to it that both members of a marital partnership enjoy equal benefits

under the law. In ORS 108.010 it provides: "All laws which impose or recognize civil disabilities upon a wife which are not imposed or recognized as existing as to the husband hereby are repealed; and all civil rights belonging to the husband not conferred upon the wife prior to June 14, 1941, or which she does not have at common law, hereby are conferred upon her."

The statute provides that a conveyance, transfer or lien executed by either husband or wife in favor of the other is valid; by an expressed intention either can convey a one-half undivided interest in property to the other and thus create an estate by the entirety; either can dissolve an estate by the entirety by conveying his or her interest in such an estate to the other; either may constitute the other his or her attorney in fact to control, sell and convey, or mortgage for their mutual benefit.

Courts are now authorized to restrain a husband or wife, or both, from encumbering or disposing of any real or personal property during pendency of a suit for divorce.

In 1943, Oregon joined its neighboring states in enacting a "community property law", but apparently the common law concept of the property of husband and wife was the more popular. The law was repealed and provision made to convert community property into property held as tenants in common, or by the entirety, or as the separate property of either.

Alteration

A broker must not overlook the rule of law pertaining to alterations in contracts after they are executed. An unauthorized material alteration of a contract after its execution, made by a party who is asserting his rights under the contract, works a destruction of the contract to such an extent that the party responsible for the alteration can assert no rights under the contract either in its altered or in its original form. As a general rule after such an unauthorized material alteration has been made the restoration of the contract to its original form will not validate the contract as to the person who has made the alteration. The purpose of this rule of law is to "impose the highest care upon the holder of the contract and to visit him with loss because of his negligent and fraudulent conduct."

This rule applies to any material change that is made in a contract which has already been signed by one of the parties thereto and even though that change consists solely of filling in a blank in a form that was not filled in at the time the contract was signed.

8007

Notary Public

The acknowledgment of the execution of most deeds is taken by a "notary public". A Notary Public is appointed by the Governor for a term of four years, based upon a written application filed by the applicant.

A Notary Public can become a "non-lucrative" office when the notary files a statement with the Secretary of State waiving his fees. The statutory fee for acknowledging a deed or other instrument in writing is $1.

The functions of a Notary Public are not considered "official duties" as prescribed in Article III, Sec. 1, of the Oregon Constitution. A notary pays an application fee of $5, a recording fee, and a bond of $500.

Written Agreements

One of the most important principles of law affecting the rights of real estate brokers is the rule which provides that a real estate broker cannot maintain an action for a commission for the sale of real property unless he has a written agreement promising to pay a commission. To be binding, this agreement must be signed by the party being sued or by his agent who has been authorized in writing to sign the agreement. The agreement must contain a description of the property sufficiently definite so that the property can be identified, must by its terms employ the broker to sell the property and must specify with reasonable certainty the amount of the commission. Unless the agreement complies with all of these provisions, it is void and cannot be enforced.

Land Under Water

Statewide enthusiasm for the efforts of the 1967 Legislature to protect the public interest in ocean beaches and treasure-trove, and by a major rewriting of ORS chapters 273 and 274, which control state lands, called attention to the wide ownership of land under water by the State of Oregon.

Title to underwater land has always been of prime concern to the professional title examiner. A knowledge of ownership identity in such lands can be of benefit to the real estate practitioner.

With admission to the Union the state gained ownership of all tidelands and the beds of all navigable streams up to high water mark. All navigable streams became common highways controllable by the state.

8008

Title to the beds of all navigable lakes was given to the state by the legislature.

Various sections of the law identify the state's ownership of land under water, as follows:

Submerged lands - lands lying below the line of ordinary low water of all navigable waters within the boundary of Oregon, whether such waters are tidal or non-tidal.

Submersible lands - lands lying between the line of ordinary high water and the line of ordinary low water of all navigable waters within the boundaries of Oregon, whether tidal or non-tidal.

Tide and Overflow lands - all lands over which the tide ebbs and flows from the line of ordinary high tide to the line of mean low tide, and all islands, shore lands and other such lands held by the state by virtue of her sovereignty.

Swamp lands - lands claimed by an Act of Congress approved in 1860. Generally, lands too wet and unfit for cultivation. Statutory provision exists for the draining of such lands.

Ocean shore - that part of the shore of the Pacific Ocean between ordinary high tide and extreme low tide, and from the state's borders with Washington on the north and California on the south. This has been declared a recreation area.

All these lands are under the management of the State Land Board, which may lease, sell or grant easements. Other lands managed by the Board are discussed in an article in the Finance section of this Primer.

State law permits any resident of Oregon over 18 years of age to purchase up to one section of swamp or tide and overflow lands.

It is interesting to note that on rare occasions a sandbar will "creep" downstream, forming an island to which the state holds title.

On non-navigable streams title to the bed is in private ownership and usually runs to the center of the stream.

Riparian owners own this underwater land on non-navigable streams, but his common law right to use the water is now regulated by statute as pointed out in the Water Rights section of this Primer.

The legislature solved the problem of "treasure-trove" on state-owned land by an amendment to existing law. Treasure-trove is defined as being "any money, bullion, precious stones, precious

metals or jewelry, found hidden, the owner of which is not known".

The Land Board has been directed to establish rules governing exploration and removal of treasure-trove, semiprecious stones and petrified wood from state-owned lands. Twenty-five percent of any treasure-trove will be retained by the Land Board. Removal of a reasonable non-commercial collection of petrified wood and semiprecious stones will be permitted.

Descriptions of property adjoining navigable streams usually describe the boundary as being the low water or high water mark, depending on the stream to which the premises are adjacent.

Where there is a slow change in the stream there will be "accretion" or "reliction", and little difficulty in determining boundary lines. If the change is sudden and violent, known as "avulsion", it can result in a loss of property and a new boundary line.

BEACH LAW

The problem of protection of public interest in ocean beaches has been temporarily solved by a new law relating to private development between extreme low tide and a point on the beach having an elevation of less than 16 feet.

Private development of this area can proceed only under a permit issued by the state highway department.

To Preserve Some Land

To provide for the preservation or maintenance of open areas and spaces the legislature has given to political bodies authority to acquire easements in such lands.

Chapter 318, Laws of 1967, permits the state or political subdivisions to purchase or acquire by agreement or donation, but not by the power of eminent domain, conservation or scenic easements in any area within its jurisdiction.

"Conservation or scenic easements" means an aggregation of easements, covenants or conditions running with the land, to preserve or maintain all or part of the natural or existing state of recreational, cultural, scenic, historic or other appropriate places of public significance.

ESTATES AND INTERESTS IN REAL PROPERTY

There are two classes of real estate - freehold and leasehold.

Under Oregon law, in freehold estates we have possessory and concurrent estates. Interests in real property will be considered under the headings of "easements" and "restrictive covenants". Leasehold estates are discussed under the chapter on "Landlord and Tenant".

A freehold estate is divided into two types: "Fee simple" and "life estate". The fee simple estate can also be a fee simple qualified estate, which provides for reversion to the grantor upon the happening of certain events. Life estates are either conventional or legal.

FEE SIMPLE ESTATE

Fee simple estate, frequently referred to as a "fee simple absolute", is the highest or greatest estate a person can have in land. It is an estate having no qualifications in length of duration, alienability, or any other particular. A deed conveys the fee simple if the grantor possesses the same, unless there is an expressed interest to convey a lesser estate.

Fee simple upon special limitation, sometimes known as a "base fee", is an estate qualified or determinable by the happening of a certain contingency. The land may have been granted to a church. If it ceases to be used for that specific purpose the estate automatically terminates and the fee reverts to the grantor or his heirs.

Fee simple on condition subsequent, is an estate in which the qualifications upon the fee are prompted by the wish of the grantor to force compliance by the grantee with some condition. He may qualify with the provision that spirituous liquor not be sold. If this qualification is violated the grantor or his heirs have the right to re-enter. A qualified fee can be granted in a will where a testator leaves his land to his widow "so long as she does not re-marry".

Fee simple conditional, is an estate in which the grantor wishes to pass his estate to a particular heir. If and when such an heir is born the estate passes in fee simple absolute.

Generally, conveyance of a qualified fee simple estate is not

8011 0106
S108

popular with the courts.

LIFE ESTATE

A conventional life estate is an estate whose duration is limited by the life of some person. This person, or life tenant, has the right to the exclusive possession of the land until the end of his estate. This carries the primary right to possession, use, enjoyment, income and profits from the land during the existence of his estate.

A legal life estate is created by the operation of the law for the benefit of the surviving spouse when the owner of the land dies.

Oregon law contains two specific applications to the life estate:

A conveyance made by a tenant for life or years, purporting to grant a greater estate than he possesses or could lawfully convey, does not work a forfeiture of his estate, but passes to the grantee all the estate which the tenant could lawfully convey.

Where real property has been devised to a person for life, and in case of the death of the life tenant without leaving lawful issue born alive and living at the time of his death, then to other heirs of the testator, a conveyance from all reversioners or remaindermen and all issues of the life tenant as are in being, of all their interest in the real property, vests a fee simple estate in the life tenant.

JOINT TENANCY

Joint tenancies are abolished in Oregon by ORS 93.180, except as to executors or trustees. The so-called "grand incident" of joint tenancy is the right of survivorship. A life estate of survivorship can be created between two or more grantees by expressed intent. Once created it cannot be destroyed unless one tenant acquires the interest of the other life tenant. Upon the death of all but one of the life tenants the fee vests in the survivor.

SURVIVORSHIP ESTATE

Though "joint tenancy", as it was known at common law, is abolished in Oregon, an estate can be created, by express words, which would permit a type of joint tenancy and survivorship.

Any attempt to create an estate of survivorship would have to be clearly and affirmatively expressed in the deed. The deed construed in the leading Oregon case wherein a survivorship was established, conveyed title to two brothers and contained the following language:

"The grantees herein do not take the title in common but with the right of survivorship; that is, that the fee shall vest in the survivor of the grantees."

It was held that this was not a "joint tenancy" but was a "life estate to two tenants in common with a contingent remainder to the survivor" and that this language did not violate the Oregon statute.

TENANCY IN COMMON

The statute aboloshing joint tenancy provides that when two or more persons take title to the same property, and nothing else is said as to their holding, they take as tenants in common.

Such co-tenants have only one thing in common, that is the right of possession. Otherwise, the quantity of their respective estates may differ, the shares may be unequal and the mode of acquisition of title may be unlike, and they may hold for different tenures.

Each tenant owns an undivided fraction and each is entitled to an interest in every inch of the soil, but none is entitled to the exclusive possession of any particular part of the land, each being entitled to occupy the whole in common with the others, and to receive their share of the rents and profits.

TENANCY MAY BE SHARED

There is no limit to the number of persons who may own an undivided interest in real property. It is interesting to note that there can be a "tenancy by the entirety" owning a unit with an individual who owns with them as a tenant in common. An example of such ownership would be a deed to three persons, two of whom are husband and wife. If the deed is silent as to how title is to be held the husband and wife would own an undivided one-half interest as "tenants by the entirety" in common with the third person who would also own an undivided one-half interest.

ENTITY MAY OWN INTEREST

A legal entity, such as a corporation, can also own an undivided

8013

portion of the premises with an individual, or two or more corporations can be tenants in common, owning undivided interests in the real property.

A husband and wife may own title to real property as tenants in common. The deed to them must recite, however, that they take title as tenants in common, otherwise they would own as tenants by the entirety. At times, there are distinct advantages why a husband and wife should own certain types of real property as tenants in common, usually because of the impact of income and inheritance taxes. Before closing the sale of substantial properties it is wise to consult an attorney and plan the method of holding title.

NO RIGHT OF SURVIVORSHIP

There is no right of survivorship in the tenancy in common. The share of a tenant in common may be inherited, sold or pledged without regard to the rights of the other tenants in common. It is also subject to involuntary sales such as execution, bankruptcy and tax sales.

Even though a tenant in common is entitled to the possession of the premises, such possession is subject to the rights of the other tenants in common. The undivided interest of each tenant may be sold, mortgaged or devised without regard to the rights of the other co-tenants.

There is, however, an obligation which each tenant has to the others. Each is entitled to an accounting of rents and profits and each to a contribution and reimbursement of sums spent for necessary repairs, and for the payment of taxes, liens and insurance premiums.

RIGHTS OF TENANTS

One tenant cannot commit waste, such as the removal of timber or other products of the land to the detriment and exclusion of the others.

If there is a sale of the premises for delinquent taxes or liens, a redemption from such sale by one tenant is a redemption for all. In such cases the tenant in common who redeems from the sale, does so for the others and his act is construed as that of an agent for and on behalf of all the other owners. The same rule applies if there is a redemption from a mortgage foreclosure when such mortgage was a lien on the interest of all the co-tenants.

One tenant in common cannot go into possession of the premises

his interest to a third person. If for instance, the husband deeds to a third party, such grantee "steps into the shoes" of the husband and actually has the same rights as the wife. Thereafter the extent of the ownership of the grantee will depend upon whether or not the husband survives the wife. If he survives then his grantee takes all, but if he dies first, the grantee takes nothing and the wife is the owner free from any claim of the husband's grantee.

Creditors cannot destroy the entirety. The interest of one tenant by the entirety may be sold under execution to satisfy his debts. If this is done, then the rights of the purchaser will again depend upon survivorship. If the debtor dies first, then the purchaser takes nothing. If the debtor survives the other tenant, the purchaser will take all.

Divorce, which severs the unity of persons upon which the entirety depends, will also destroy and terminate the entirety. Thereafter each will own an undivided one-half interest as tenants in common.

A common law marriage, or a statement on the instrument "husband and wife", does not create a tenancy by the entirety. A lawful marriage does this automatically. In these other cases a tenancy in common is created. If the parties are lawfully married the tenancy by the entirety is created whether or not the marital status is shown on the deed.

As stated before, a husband and wife can take as tenants in common by an expressed statement. Tenancy by the entirety is a concurrent estate with indestructible rights of survivorship.

A tenancy by the entirety is dissolved only by death, divorce, conveyance of the property by both tenants, or by a conveyance of one to the other.

It has been pointed out that after a divorce they hold as tenants in common. If the property is awarded to one party by the decree that party receives the other's undivided one-half interest subject to liens and encumbrances existing at the time of the decree.

WHAT TYPE TENANCY?

Just how to hold title depends upon many factors. Consideration should be given to the type of property being acquired, the worth of the individuals and the impact of income and inheritance taxes.

Since 1959 tenancies by the entirety have been subject to state inheritance taxes to the extent of one-half of the value of the property. Federal inheritance taxes are based upon the entire value of the property. Other provisions of the inheritance tax laws covering joint ownership of property may not make it desirable to create a survivorship estate. For this reason competent legal advice should be sought upon the acquisition of title to real property, especially if it has substantial value.

Dower and Curtesy

The rights of married persons in the lands of their spouses vary in each state. In the Pacific Northwest, Oregon is unique and is an island surrounded by states which have an entirely different concept in their consideration of the rights of married persons.

Oregon is a "common law state" and retained the "dower" and "curtesy" theory, whereas our neighboring states are all "community property states". Dower and curtesy are based upon the "common law" with its origin in England, whereas "community property" stemmed from Germanic tribes, and through Spain to the Spanish colonies of North and South America. These differences sometimes lead to confusion and misunderstanding, especially to those persons who have resided in another state.

DOWER - CURTESY ABOLISHED

Effective July 1, 1970, the new Oregon Probate Code repealed the statutory property rights of dower and curtesy.

Dower arose as a result of the public's desire to provide for the support of the widow and her children after her husband's death. Curtesy is the corresponding right of a widower.

Under the old Oregon law, the dower interest included a life estate in one-half of all the equitable interest which had been owned by the husband at any time during their marriage. This dower interest would not become a complete or "vested" property right until the husband died. For this reason, that interest which the wife held in this real property before her husband's death, was known as "inchoate" dower, meaning incomplete.

This made it necessary for both husband and wife to sign every document attempting to convey an interest in real property. As a result of the change only the actual owner must sign a listing, earnest money receipt or deed.

Under the new Probate Code, the surviving spouse has a right to elect to take a one-fourth share of the deceased spouse's net estate instead of what is given her or him under the will.

Easements

An easement is defined as a non-revocable right to use the land of another for a specified purpose. To have a valid easement it is necessary that it be made clear in the instrument an intention to create servitude.

There are two types of easement. "Appurtenant" and "in gross". An easement is not a natural right, but one which must be created. It is an interest in land, but not an estate in land. It is both a non-possessory right and a restricted right.

An easement is created by express grant, or express reservation. It may be implied, or created by ways of necessity. To be valid it must spell out a description of the land it will occupy and the limits of the duration. The fact that it is non-revocable distinguishes it from a license.

EASEMENTS IN GROSS

An easement in gross is a mere personal right and interest in the real estate of another, which is not dependent upon the ownership of any adjoining property by the party who has the easement. A servient estate exists but there is no dominant estate. An example: The owners of other lots in a tract have an easement in gross, an enforceable easement, in the set-back lines reserved in the instrument filed for the tract.

EASEMENTS APPURTENANT

An easement appurtenant is the right belonging to a dominant estate to the use of a servient estate. It is created for the purpose of benefiting the land possessed by the owner of the easement. This easement is said to "run with the land", and passes with the estate to the grantee whether or not it is mentioned. Easements of this nature are most frequently for utility services.

If there is a mortgage on a tract of land, before it is encumbered with an easement, the consent of the mortgagee should be obtained and recorded.

The most common easement is a "right of way", but easements are obtained for light and air, lateral support, party wall, or

8018

encroaching wall.

PROFITS A PRENDRE

Closely akin to an easement is a "profit a prendre", a right to take from another's land a part of the soil, or the products of the soil. This right carries with it a profit, a right absent in an easement.

The grantee may remove sand or gravel, standing timber or crops, subject to legal restrictions. Oregon law treats the sale of standing timber as creating an estate on condition, subject to being defeated if the timber is not removed within the time specified in the contract. If "all the standing timber" is granted, an estate is created. If "the right to cut and remove timber" is specified, then a license has been given.

Restrictive Covenants

The words "conditions, covenants and restrictions" are a familiar phrase to those acquainted with real property law expressions. They call attention to the fact that a tract of real property is restricted in its use in some manner.

The established usage of these words to indicate in a broad way a particular fact, frequently causes the legal significance of each to be overlooked. A condition or a covenant in a deed of conveyance of land is a qualification or restriction that in case a particular event does or does not happen, or in case the grantor or grantee omits to do a particular act, an estate shall commence, be enlarged, or be defeated.

The most common use of these words is to make reference to the fact that a particular tract or area is restricted in its use, such as for residential purposes.

Conditions and covenants contained in real property documents can also restrict the land in other ways, or defeat a conveyance upon the happening of an event. The word "restriction" is used to convey the thought that the use of land is limited in some way. Reference may be made to a "restrictive condition" or "restrictive covenant". The line of distinction as to whether or not a restriction is a condition or a covenant is a fine one. A very important consideration in determining the nature of a provision as a covenant or a condition is the presence or absence of a forfeiture or reversionary clause in the event of a violation of such a provision. If for instance, the document which imposes a restriction also provides that upon a breach thereof title will revert to the grantor, then the restriction

is a condition. On the other hand, if the restriction provides that upon breach or violation the person imposing the restriction, or others may bring action for damages, it is a covenant. In common usage the distinction between a covenant and a condition is often overlooked, but could become very important in the event of a breach of the restriction.

OWNER HAS FREEDOM

An owner of land has the right to sell or convey his land as he sees fit. He can impose any condition, covenant or restriction he wishes, without regard to its effect or how ridiculous it may be or seem to be. The only restraint to which he must observe is that such condition or covenant does not impose either an impossible requirement or an unlawful condition which is contrary to public policy.

Restrictions can be imposed in a number of ways:

1. They may be made by a deed conveying a single tract of land.
2. By an agreement entered into between two or more owners of land.
3. By the conveyance of a single tract of land and then by later reference in other deeds of adjoining properties, to the restriction in the first deed.
4. By a declaration of conditions and restrictions imposed and established by a single document.

RESTRICTIONS A BENEFIT

The use of the word "restriction" would indicate that there is a restraint which would preclude the free use of the land. This is so, but does not necessarily mean that such restraint is detrimental to the value of real property. In many instances restrictions have increased the value of property because such restrictions have the effect of giving to property a higher and better use.

The intent of parties imposing restrictions and the interpretation thereof has led to many legal actions. Attorneys drawing such documents should use care to see that the intent is clearly expressed, because courts strictly construe the restriction and any doubts are resolved against the restraint.

If there is a general plan, then the restriction is for the benefit of all parties affected thereby. Regardless of the size of the subdivision all persons who are subject to the same

restriction have a right to the enforcement thereof. The fact that a complainant's tract is at some distance from the parcel upon which the violation occurs, would make no difference. The test is whether or not each is subject to the same restriction and whether such restriction is for the benefit of all.

RESTRICTIONS EXTINGUISHED

Restrictions are extinguished in a variety of ways. Some expire after a stated period of time; others only upon a mutual agreement by those affected. Sometimes the change in character of a neighborhood will result in the extinguishing of a general restrictive scheme. Such termination will depend, however, upon the actual facts as to such changes and usually can only be determined by a lawsuit. Also a person may be precluded from enforcing such restrictions or may be precluded from restraining a use because of laches. One cannot stand by and knowingly allow a violation to take place and then at a later date complain. This too, will usually result in a legal action.

Another form of restriction is through the use of zoning ordinances which are imposed by ogvernmental action and differ from restrictions imposed either by conditions or covenants. Each operate independently of each other and at times are inconsistent. A zoning ordinance may permit the use of the tract for commercial purposes, while a condition or covenant covering the same tract may restrict it to residential use. Neither will take priority over the other. Private restrictions will only yield to public restrictions when they require something to be done which is unlawful under the government regulations. Building setback lines, usually established under the police power of the municipality, will take priority over a private restriction if such private restriction would require a violation of such public restriction. If, however, a private restriction requires a greater setback than the public ordinance, then the private setback must be complied with. It is incumbent in construing restrictions on real property to examine and consider both the public and private restrictions. One cannot assume that the most beneficial requirement imposed will be the one which will prevail. This is an excellent situation for the aid of an attorney.

The proper remedy for enforcement of restrictions in Oregon is by injunction relief. For a restriction to run with the land it must:

1. It must be in writing.
2. The parties must express their intent that is shall run with the land.
3. It must relate to the real property or its enjoyment.

4. At law, there must be privity of estate (a simultaneous transfer of land or an easement); or in equity, a notice to the party burdened of the existence of the servitude.

Zoning Ordinances

To many persons who deal in real estate the effect of zoning ordinances at times seems unjust and without reason. To some, the changing of zones, especially after purchase of a property for a specific purpose, appears to be tantamount to taking property without just compensation.

The people themselves have relinquished to the State a certain control over their property. The control so relinquished is that which the State must have in order to protect the health, morals, peace, safety and welfare of the public. This is called "police power".

This right, to so regulate, has been passed on to cities and counties through enactment of permissive legislation which enables cities and counties to establish zones wherein a municipality can regulate, restrict and segregate the location of industries, businesses, apartments, multiple dwellings, single family dwellings, public and semi public buildings. Such rights also provide for the regulation of building heights and the determination of yards, courts and open spaces.

The first statute permitting the zoning of cities was passed by the Legislature of the State of Oregon in 1919. The voters of the City of Portland, on November 4, 1924, enacted by the initiative process an ordinance dividing the City into districts. This ordinance was almost immediately the subject of a lawsuit to test the constitutionality of the 1919 Act.

Perhaps the preamble of the 1919 Act best illustrates the purpose of zoning and also expresses the State's right under its police power to establish zoning districts. The first part of the Act reads as follows: "For the public interest, health, comfort, convenience, preservation of public peace, safety, morals, order and public welfare . . .".

It is generally recognized that it is highly desirable for a city to plan its development and growth. There is also a virtual unanimity of opinions holding that zoning is a legitimate exercise of police power. Federal decisions hold that general ordinances are valid, but individual restrictions and limitations imposed by the general ordinances must bear some substantial relation to the public health, safety and general welfare. Such general ordinances have been held not to deprive land owners of

their property or its use without due process of law. While there appears to be a deprivation of a use of property, such deprivation is with due process.

Existence of a zoning ordinance has a strong effect on "market value", but it is not an encumbrance on the real property.

Boundary Lines and Adverse Possession

A prolific cause of disputes between adjoining property owners is the determination of the location of the boundary line between their respective properties. Owners are at times surprised to learn that a portion of their premises is occupied by their neighbor, or that the boundary line is not where it was thought to be. Most times such disputes are resolved by an agreement between the parties or by the exchange of deeds.

The rights of the respective parties in such a situation depends upon the actual state of facts which pertain to the specific problem. If a fence is so constructed or located as to encroach upon the adjoining land, the result may be that the fence could, under certain circumstances, determine the boundary line between the tracts, even though legal title is otherwise.

One of the common methods of acquiring title to real property, other than through purchase and conveyance of title, is by adverse possession. Such acquisition is based upon possession and may apply to a whole tract of land or to only a part thereof. The principle covering acquisition of a whole tract and that which applies to boundary lines is practically the same. We are confined here to the determination of boundary lines only.

There is a common concept that occupancy of an area of land for a period of ten years will result in the acquisition of, and ripen into, a good title. This is not entirely true, because the circumstances under which the occupation occurs are a factor which will determine the situation.

NO ADVERSE STATUTE

There is no specific statute in Oregon which provides that occupancy for a given period of time will ripen into ownership because of adverse possession.

Adverse possession refers to a principle based upon and governed by the policy that limits the right and remedy for the possession of land to actions brought within a stated time. In other words it is a right to defend against an adverse claim, but

such right is extinguished if it is not exercised within the stated period. One cannot stand by and allow a stranger to a title, take possession and exercise the functions of complete ownership. Such acts must be defended against. This principle of defense is governed by the Statute of Limitations. The statute applies to other rights and limits actions at law for recovery or relief. As applied to real property the statute provides: "An action for the recovery of real property, or for the recovery of possession thereof, shall be commenced within ten years".

In order to prevail, the claimant must prove that he had been in actual, notorious and exclusive possession under a claim of ownership for the statutory period. The courts have given many definitions of adverse possession wherein they have attempted to define, "actual, notorious and exclusive possession". Such decisions seem to resolve the fact that the possession must be visible so that an owner of the legal title may have an opportunity to learn of the adverse claim and protect his rights. Actual knowledge of possession on the part of the true owner is not, however, necessary; it being sufficient that he could have learned thereof by the exercise of proper diligence.

BOUNDARY DISPUTES

Boundary disputes are usually the result of a mistaken belief of ownership. In the past some of the cases in Oregon have varied the rule of adverse possession as applied to boundary line disputes.

A recent Oregon case has done much to clarify these principles as applied to boundary disputes. In this case the court stated the following: "We think our law should now be clarified and we hold the possession under a mistaken ownership satisfies the element of hostility of adverseness in the application of the doctrine of adverse possession. The evidence must show a possession visible, notorious and exclusive under a claim of ownership, continuing ten years, and the owner must have knowledge of such possession and claim."

Many disputes concerning boundary lines can be prevented if a proper survey of the premises is made, either at time of purchase or before the construction of a fence. The mere fact that a fence exists near the boundary line will not in itself determine the boundary between adjoining parcels. Such fence must be recognized and accepted by the parties as the actual boundary line, but this in itself will not give title to the adverse claimant. The rights of the parties must be adjudicated through the medium of a lawsuit, and the facts concerning location of a fence, the period of time it has existed, and the nature of the possession are only evidence, for the purpose of determining if such possession is sufficient to

satisfy the elements of adverse possession and thereby acquire title.

CONTROLLED ACCESS TO PUBLIC HIGHWAYS

An exercise of "police power" by the State is exemplified by legislation to control access to public highways. Such control to our highways is comparatively new, the first such Act being passed by the Legislature in 1947.

Access to a road or highway is a private right enjoyed by the abutting property owner. It is an easement to said public road, but should be distinguished from the common concept and use of the word "easement". Normally, we use this word in a sense that it refers to the use of the land of another for a special purpose. The word "access" denotes the right vested in the owner of the land which adjoins a road or highway to go and return from his land to the highway without obstruction.

Adjoining owners have two distinct rights in a road or highway.

1. The kind he enjoys in common with others, a public right.
2. Private right, not common to the public, only to his contiguous ownership.

The private rights of owners of adjoining property which are common to the public are generally, the right of access, of view, of light and air, and of lateral support. These rights are subordinate to the right of passage of the public and are subject to reasonable regulation and restriction.

While public rights in a road or highway can be taken away by the governing bodies at any time, the loss of such public rights are not subject to the payment of compensation by reason of such loss. The public rights are usually lost through vacation or relocation of a road or highway. When this occurs the only obligation is to maintain to the adjoining property owner his right of access. In other words, payment is only made for the loss of private rights.

Access to and from a public road or highway is a property right and cannot be damaged or taken without just compensation. An owner, when access is taken, may sustain damage without suffering loss of physical property, but the loss of the right is sufficient to entitle him to compensation. If, however, he has free and convenient access to his property and the improvements thereon, and his means of ingress are not substantially interfered with by the public, even though he does not have access at all points in the boundary between his land and the highway, he has no cause of complaint.

LEGAL LIMIT ON ACCESS

The foregoing are general rules which have always applied to the rights of abutting property owners on a road or highway. This general rule has been changed through legislation and it is now possible to purchase property adjoining a highway and not be able to have free access to such highway.

The 1947 Legislature exercising its right under the "police power" of the State enacted legislation to authorize the Highway Commission to "lay out, locate, relocate, adopt, establish, construct, designate, maintain and supervise the use and operation of a new highway known as "throughways". This Act also authorizes the Commission under certain circumstances to change an existing road to a throughway and thereby control the access thereto.

Additional legislation has been enacted which also authorizes the State Highway Commission, with respect to state highways, other than throughways, and the County Court, or Board of County Commissioners, with respect to county roads, to adopt reasonable rules and regulations, and to issue permits for the construction or placing of approach roads to such highways or roads. Such rules and regulations may regulate the manner of construction and the width thereof, and may also require the removal of such approach if not constructed in accordance with said rules and regulations.

When purchasing the title to real property which abuts upon a major road or highway, inquiry should be made as to the right of access in order that proper use of the premises can be had consistent with its intended use.

CONDOMINIUM

A new concept of land ownership in Oregon was born with the passage of the "Unit Ownership Act" in 1963.

The condominium, known to the Romans as early as the sixth century, was legalized in Oregon to take advantage of FHA financing.

Closely related to a subdivision, the condominium in Oregon is specifically included in the Subdivision Control Law.

Unlike the "Stock-Lease Cooperative" and the "Co-ownership Cooperative", the owner of a condominium unit has the same rights he acquires when he purchases an individual house and lot in a subdivision. He may mortgage his unit separately, or he may lease, sell or devise the same without regard to the owners of other units.

The unit is taxed separately just the same as an individual home is taxed. Because of a 1967 amendment a lessee in a condominium is taxed in the same manner as an individual owner.

The unit owner must share in his prorate portion of the expenses of the maintenance of the common areas.

The Unit Ownership Law is part of another section of the Primer.

Q. 5 In tenancy in common, there is always a unity of:

(A) time
(B) title
(C) interest
(D) possession

Q. 6 On what theory of law is the "tenancy by the entirety" based?

Q. 7 What is the name given to the right to use of a portion of another's property without having title thereto or lease?

(A) encumbering easement
(B) appurtenant easement
(C) encroaching
(D) trespassing

Q. 8 A tenant for life is in possession of a parcel of real estate. Explain why he can or cannot enter into a valid lease, as lessor, of the property.

LANDLORD AND TENANT

LEASES

A lease is a written document through which the possession of real property is given by the owner to a second party for a specified time for a specified rent. During the past 20 years the leasing of real property in Oregon has very rapidly increased.

The lease of real property for a stated period of time made its appearance in our law as early as the reign of William the Conqueror (1066-1087).

Early leases were used primarily to raise a large sum of money immediately. They were made for long terms and payment of the entire gross rental for the period was paid at the beginning of the term.

For a great many years there existed a belief that 40 years was the maximum term of a lease. By 1270, however, leases for 100 years were being made, and today 99 year terms are common.

In the first years of the leasing of real property the rights of the lessee came from the Roman law based on a contractural right to use without ownership. The lessee had no rights in the land, merely the benefit of a contract to use of it.

Between 1200 and 1500 common law recognized the lessee as the owner of an interest in the land, protected against the lessor and third parties. The interest of the lessee came to be regarded as an estate in land—the lease was a conveyance rather than a contractural arrangement between the parties.

Today the lease has become a synthesis of conveyance notions and contract notions. A controversy rages among accountants, lawyers, economists, investment bankers and others as whether to charge to income rental as it becomes due or to capitalize the income stream for the entire period into present worth.

We will treat a lease of real property as a conveyance of an interest in the land to the tenant, recognizing, however, that leasehold estates are *chattels real.* They give to the tenant an interest or estate in real property, but are a form of personal property governed by the laws applicable to personal property.

In the execution of a lease of real property a landlord and tenant relationship is established. The landlord becomes the *lessor* and the tenant the *lessee.*

The lessor's interest in the contract is the right to receive rent and the right to the reversion (right to get the land back). The appraiser measures the present worth of a lease by capitalizing the rents plus the reversion.

The lessee's interest in a lease is known as a leasehold. The leasehold gives to the lessee the beneficial rights of use and occupancy, plus the right to receive any excess rent during the life of the lease.

"Excess rent" is defined as the surplus, if any, of economic rent over the contract rent called for in the instrument. Economic rent is what the property would bring in the open market if vacant and ready to be leased today.

Appraisers refer to a "negative leasehold" and a "positive leasehold." In the former the contract rent is found to be higher than the economic rent, while a positive leasehold is one in which the economic rent exceeds the contract.

A lease illustrates an operation of the "two property concept." Technically the owner has sold one of his rights. In the contract the lessor conveys one of his rights from his "bundle of rights"—the right of possession in exchange for rent. The lessee becomes the owner for the term, and, unless he commits waste, has the right of "quiet enjoyment." A breach of this right is an eviction (dispossession of tenant).

Rent can be money or something else, such as labor or a share of the crops.

The body of law concerning real property leases is what is called the "Law of Landlord and Tenant."

In Oregon a tenancy is deemed to exist when one has let real estate to another to hold of him as a landlord. We know that tenancies can be freehold estates, or estates of less than freehold. A freehold estate is defined as an "estate of indefinite duration", while an estate of less than freehold is an "estate of definite duration." A lease, therefore, is an estate of less than freehold.

TYPES OF TENANCY

The law of Landlord and Tenant classifies tenancies as tenancy at sufferance, tenancy at will, tenancy for years, tenancy from month to month, tenancy by curtesy, tenancy by entirety, and tenancy for life.

Definitions of the applicable tenancies are as follows:

TENANCY AT SUFFERANCE—One who comes into possession of the real estate of another lawfully, but who holds over by wrong after the termination of his term. No notice is required to terminate this tenancy.

TENANCY AT WILL—One who enters into the possession of real estate with the consent of the owner, under circumstances not showing an intention to create a freehold interest. When the rent reserved in the lease at will is payable at periods of less than three months, a notice to terminate the tenancy is sufficient if it is equal to the interval between the times of payment of rent.

TENANCY FROM YEAR TO YEAR—One who enters into possession of real estate with the consent of the owner, and no certain time is mentioned, but an annual rent is reserved. Notice to terminate is sufficient if given 60 days prior to the expiration of the period for which rents are paid.

TENANCY FROM MONTH TO MONTH—One who holds the lands or tenements of another, under the demise of the other, and no certain time has been mentioned, but a monthly rental has been reserved. Tenancy may only be terminated by either the landlord or tenant giving the other, at any time during the tenancy, not less than 30 days notice in writing.

When the terms of the lease fix the date of expiration of tenancy, no notice is required to render the holding of the tenant wrongful and by force after the expiration date.

Terms of a written lease may waive notice

8028

required. Notice must be in writing conspicuously posted on premises or left at residence.

PAYMENT OF RENT

Unless a different period is stipulated in the lease, the failure of a tenant to pay the rent called for by the terms of the lease for a period of 10 days after it becomes due and payable, operates to terminate his tenancy. No notice to quit or pay the rent is required to render the holding of such tenant thereafter wrongful. If the landlord, after such default, accepts payment the lease is reinstated for the full period fixed by its terms.

Unless expressly provided for by the terms of the lease all rents are due and payable in advance. The tenant shall pay or tender payment on or prior to the first day of the rent paying period, and no demand is necessary to render a tenant in default. (This is an example of statutory law prevailing over common law. In common law the rent was payable at the end of the term.)

Every person in possession of land out of which any rent is due, whether it was originally demised in fee, or for any estate of freehold, or for any term of years, is liable for the amount of the rent due.

Such rent may be recovered in an action at law, and the deed of demise, or other instrument in writing, if there is any, may be used in evidence by either party to prove the amount due.

FARM TENANT'S RIGHTS TO EMBLEMENTS

When the leasing or occupation is for the purpose of farming or agriculture, the tenant or person in possession shall, after the termination of the lease or occupancy, have free access to the premises to cultivate and harvest or gather any crop or produce of the soil planted or sown by him before the service of notice to quit.

USE FOR GAMBLING PROHIBITED

No person shall let or rent any real property knowing or having reason to believe it will be used for gambling purposes.

All such contracts are void.

An owner learning of such use can avoid or terminate such lease and recover immediate possession by an action of law brought before a justice of the peace.

An owner knowingly violating this law is liable to forfeiture of twice the amount of the rent for six months; the district attorney to institute the action in the name of the state.

ESSENTIALS OF A VALID LEASE

While no particular form or language is necessary to create a leasehold, it is essential that certain elements be present. These are:

1. The parties must have contractual capacity.
2. There must be an agreement to let and take.
3. The premises must be described.
4. The term or duration must be defined.
5. Amount of rent or consideration must be specified.
6. It must be duly executed.
7. There must be a voluntary delivery and acceptance.

STATUTE OF FRAUDS

A lease of real property for a period of more than one year, in order not to be void, must be in writing. A lease for a period of less than one year may or may not be in writing. A lease for exactly one year must be in writing if it is to take effect at some time subsequent to execution.

KINDS OF LEASES

Leases fall into two broad classes—"short term" lease and "long term" lease. Any lease running for more than 10 years is generally defined as a long term lease, while one for less than 10 years is a short term lease. Leases may or may not be recorded. It is recommended that all long term leases be duly recorded.

Among the many kinds of leases are the following:

MONTH TO MONTH—Such tenancy may or may not be under a written lease.

GROSS LEASE—Also referred to as a "fixed" or "flat" lease. The rent is stated as a sum to be paid the lessor monthly, quarterly or annually and is the only liability for payment by the lessee.

NET LEASE—This provides a net income to the lessor, the lessee agreeing to pay the normal costs of the property, such as taxes and insurance, in addition to the rent.

PERCENTAGE LEASE—A popular form of commercial lease in which the lessee pays a percentage of his gross sales or income. There is usually a minimum rent. This lease is most successful if the percentage agreed upon is what that type of business pays elsewhere. In a sense this lease makes the landlord a partner of the lessee. It is used because of what is known as "commercial income", the fixed ability of a merchant to pay, determined by the type of merchandise and amount of sales. The lessor under a percentage lease usually need not worry about getting his just return because most such leases contain a clause that voids the contract if dishonesty is discovered.

OIL AND GAS LEASE—Recently becoming popular in Oregon. Usually a flat sum is paid for the right to explore for oil or gas. If successful, the lessee agrees to pay a royalty which is quite commonly one-eighth of each barrel of oil.

GRADED LEASE—Also known as a "graduated lease." Usually a flat minimum or flat rent, stepped up or down after an initial period. Step-up helps the tenant get established (this can be a hardship if step-up comes during a recession). Step-down sometimes provides a tax advantage.

RENEWAL LEASE—Provides at time of negotiation for an extension. If the clause is an "option to renew" the option rests with the lessee. If an "automatic renewal" both parties retain the right to make a decision.

REVALUATION LEASE—The rental is revalued every so many years, usually on the basis of an appraisal. This is a hazardous type of lease because of its encouragement of quarrels.

LEASEBACK OR LEASE PURCHASE—Under this form the owner of a property sells to a buyer and then leases the property from the buyer as lessor, the seller becoming the lessee. This is usually a long term lease. Its advantages include the acquiring of capital in a business, and tax concessions earned by changing a fixed asset to a current asset. Companies that do not need the 100 per cent locations frequently erect the improvement, sell the property, and then enter into a long term lease. The yield to investors in such an arrangement is sometimes as low as 4½ per cent, but is said to be "as safe as a bond."

INDEX LEASE—A lease in which the amount of rent is tied to national indices, such as the cost of living or value of the dollar.

SANDWICH LEASE—Essentially the sub-letting of a leased property in which the lessee lets to another party and becomes both lessor and lessee. Unless prohibited by the terms of the instrument, a lessee may assign or sub-let his lease.

LEASE-OPTION—A lease containing an option to permit the lessor to purchase the property at a fixed price or a negotiated price, or a price to be established by neutral appraisers.

FARM LEASE—A lease used in rural areas. Usually provides for a flat annual rental, a share of the crops, or both.

ROOF TOP LEASE—A frequently used instrument to lease space for the erection of display or advertising signs.

The rental income from a business lease is frequently influenced by pedestrian traffic in the vicinity of the property. There are three kinds of pedestrian traffic, namely, structural, lane and shopping.

Structural traffic is comprised of persons employed in offices, shops and factories. Lane traffic refers to persons passing to and fro with a definite purpose in mind. Shopping traffic refers to women in particular and is, of course, the most desirable kind of traffic.

TERMINATION

A lease may be terminated for:

1. Breach of conditions.
2. Eminent Domain.
3. Destruction of premises.
4. Constructive eviction on the part of the landlord.

In the event of condemnation, misunderstandings may arise. To avoid these there should be a clause giving the lessee no part of the award, or a stated sum, in the event of an exercise of the power of eminent domain.

Unless stated otherwise in the lease the tenant has the responsibility of keeping the premises in repair.

The lease should also contain a clause clarifying future removal of trade fixtures.

Many leases contain a "distraint clause" which permits the lessor to levy upon the tenant's goods and chattels for rent in arrears.

In discussing leases we may hear the phrase "doctrine of anticipatory breach", which is a common law understanding that one party can sue on a breach without himself performing his own promises; or the "doctrine of frustration", which releases the tenant from the obligation to pay rent when some change, usually of a statutory nature, prevents him from enjoying the lease.

MORTGAGE ON A LEASE

A mortgage on a lease is employed when a business is sold in which part of the transaction involves the transfer or assignment of the lease. The seller obtains a mortgage on the lease in addition to promissory notes. Thus, in the event of default on the part of the purchaser, the mortgagee may foreclose the mortgage on the lease and in effect regain control of the business. Without this he could only sue for money judgment on the notes.

PERSONAL PROPERTY LEASES

The leasing of personal property is part of the law of bailments. This is strictly a contractual arrangement where a thing is hired, the hirer or bailee gaining temporary use thereof and the obligation to return the thing.

When a lease of real property is treated as a conveyance the lease is said to be an "executed" contract. The lease used for personal property is said to be a "executory" contract, one in which something remains to be done—the return of the thing hired.

The Federal bankruptcy law treats all leases as executory contracts. This law limits the lessor to damages in an unexpired lease to one year's rent.

Q. 9 How is a lease transferred by the lessor to a purchaser of the leased property?

Q.10 One who has the right to possession and use of real estate under an oral agreement is known as what?

MORTGAGES, TRUST DEEDS AND LIENS

Mortgages

With few exceptions, modern transactions involving the transfer of title to real property require some degree of financing. This financing is generally accomplished through use of the real property as security for the debt created by the necessity of borrowing.

The vehicle through which this financing is handled is either a "mortgage" or a trust deed.

A mortgage is commonly defined as a pledge of property as security for a debt. Mortgages are not always used to effect a transfer, but regardless of purpose, when a mortgage is used a debt has been created for payment of which the property becomes security.

"Mortgage" actually designates two writings or documents. The primary written instrument is a promissory note, which is evidence of the debt. The second is the mortgage document itself, which creates an interest in the described property as security for the debt evidenced by the note.

The two instruments, note and mortgage, are to be construed together. If, however, there is a conflict with respect to maturity of the debt, the provisions of the note control. If the mortgage contains an acceleration clause and the note does not the provisions of the mortgage control.

The note given in a mortgage is a negotiable instrument or a written promise to pay. Negotiable instruments are an indispensible factor in commerce —consider the common bank check. The "holder in due course" provision of the state law erects certain protections for the third party in the transfer of negotiable instruments, and when a note is transferred the transferor implies certain warranties. These are: that the instrument is genuine and what it purports to be; he, the transferor has a good title to the instrument; all parties had capacity to contract; he does not know any fact that would impair the validity of the instrument or make it valueless.

A mortgage is a contract, and to be valid must contain all of the elements of a contract. We know these to be (1) parties capable of contracting, (2) their consent, (3) a sufficient consideration, (4) a lawful object, (5) a proper writing.

The parties to the mortgage are the "mortgagor", who is the borrower, and the "mortgagee", who is the lender.

A mortgage in which real property is pledged to secure a debt is usually simply referred to as a "mortgage." When personal property is the security the instruments are identified as a "chattel mortgage."

CREATES A LIEN

Oregon law treats a mortgage as a lien against the property, the title remaining with the mortgagor. With the recording of the document the lien is publicly established. The priority of the lien is created by the time of its recording. In the absence of fraud, the document recorded first, regardless of date of execution, is the first lien or "first mortgage", and subsequent mortgages are "junior mortgages."

A minority of the states follow the "title theory" as opposed to the "lien law theory" in Oregon. Under the title theory the mortgagor passes title to the mortgagee. Upon payment of the debt the title reverts to the mortgagor.

The law of Oregon states that a mortgage of real property is not a conveyance so as to enable the owner of the mortgage to recover possession of the property without a foreclosure and sale.

Other provisions of Oregon law relative to mortgages state:

A mortgage does not imply a covenant for the payment of the sums secured. When there is no express covenant for such payment in the mortgage, and no note to secure such payment, the remedies of the mortgagee are in the lands mentioned.

All improvements are a part of the mortgaged property and are subject to the mortgage lien. If removed the mortgagee may regain possession or recover the value thereof.

When the mortgagor fails to pay taxes, assessments, interest on prior mortgages, insurance premiums, or other charges necessary for the protection of the lien, the mortgagee may pay any or all of the costs and add the amount to the mortgage debt. These additions will bear the same rate of interest as the original obligation.

Mortgages may be assigned by an instrument in writing, executed, acknowledged and recorded. The recording is not of itself notice to the mortgagor, so as to invalidate a payment made to the mortgagee.

A mortgage is discharged by the owner delivering a certificate of satisfaction to the county recording officer, or by an entry in the margin of the proper page of the official record, signed by the mortgagee. When there has been a transfer of the note by endorsement, and no formal assignment of the mortgage, the holder of the note executes the satisfaction.

If a mortgagee fails to discharge the mortgage lien within 30 days after being requested to do so, he is liable in the sum of $100 and for all actual damages occasioned by such failure.

THREE CLASSES

Real property mortgages are usually one of three classes—FHA insured mortgage, GI guaranteed mortgage, and the conventional mortgage. In Oregon we have an "in between" type in the mortgage used to secure a State Vet loan. This is essentially a conventional mortgage, but the loan is made directly by the state government.

Most popular form of mortgage, and one highly developed by the FHA, is the amortizing mortgage which retires the debt by a series of equal monthly payments of both principal and interest. A variation of this form includes in the monthly payments necessary amounts to cover taxes and/or fire insurance premiums.

There is also the "straight" mortgage which calls for the payment of interest only during the term of the note, and the "installment" mortgage which calls for periodic payments on the principal, such payments being separated from the interest payments.

Other forms of mortgages are the package mort-

gage, blanket mortgage, open end mortgage, lease mortgage, crop mortgage, and "purchase money" mortgage, all of which are defined in the "words and phrases" section of this Manual.

The purchase money mortgage is merely an extension of credit by the seller to the buyer. In the event of a default in payments under a purchase money mortgage the mortgagee can foreclose. The decree in such a case shall provide for the sale of the real property covered by such mortgage, but the mortgagee shall not be entitled to a deficiency judgment on account of the mortgage or note or obligation secured by the same. A deficiency judgment is usually sought in a mortgage foreclosure when the sale does not bring a sufficient amount to satisfy the debt. In the case of a purchase money mortgage no money was actually loaned.

The same prohibition against a deficiency judgment is found in the trust deed law, although in this case money was loaned.

As a general rule, all governmental liens become a first lien on the property. In some instances a purchase money mortgage or trust deed, subject to proper recording, takes precedence over all but government liens. The importance of recording is emphasized in the Oregon law stating that a conveyance of real property shall be void as against the lien of a judgment unless such conveyance be recorded at the time of docketing the judgment.

Chattel Mortgage

As is the case with a mortgage involving real property, in order that there be a valid chattel mortgage there must be a debt and evidence of the debt, and an instrument creating an interest in the property—in this case the interest is in personal property.

Legal requirements applying to chattel mortgages are found in the Uniform Commercial Code.

Oregon Trust Deed Act

Conveyances to a Trustee to secure a loan were in use in the later seventeenth century in England. In this country the use of Trust Deeds has been wide spread. Some twenty-two states had legislation authorizing Trust Deeds when the Trust Deed Act became effective in Oregon in its present form on August 9, 1961.

Trust Deeds are given to secure loans on real estate. They perform the same function as a real estate mortgage, but there are differences in the terms used, in the methods of handling, and in foreclosure.

Whereas a mortgage involves two parties, the mortgagor (borrower) and the mortgagee (lender), a Trust Deed involves three parties, the Grantor (borrower), the Trustee, to whom the property is conveyed as security for the note, and the Beneficiary (lender). The note which is secured by the Trust Deed is given by the Grantor to the Beneficiary (not to the Trustee) in the same manner as in a mortgage transaction. The loan is handled by the broker, the mortgage company or bank, and the title company in the same manner as a mortgage transaction, with certain exceptions.

The Trust Deed Act provides that only an attorney admitted to the Oregon State Bar, a bank, trust company, savings and loan association, or a title insurance company, its agents or affiliates, each of which is authorized by State law or Federal charter, can act as Trustee. In normal practice it is usually the title insurance company which writes the title insurance that will be named as Trustee in the Trust Deed. The Trustee and the Beneficiary must be two different persons or corporations and cannot be the same, since the purpose of the Trust Deed is to have an individual or company other than the lender or borrower control the security.

In filling out the Trust Deed the property owner and his wife will be named as "Grantor", a title insurance company or one of the other eligible parties would be named as "Trustee" and the lender (whether an individual, mortgage company, bank or savings and loan association) would be named as "Beneficiary."

The property description is filled in as in a mortgage. The Trust Deed Act limits the coverage of Trust Deeds to real property which does not exceed three acres. If the property is larger than three acres a mortgage must be used and not a Trust Deed.

The Trust Deed secures a promissory note made payable to the Beneficiary by the Grantor. The instrument is signed and acknowledged by the husband and wife, and delivered to the lender with the signed note as in a mortgage. The instrument is recorded in mortgage records, and the Grantor is indexed as the mortgagor and the Beneficiary as the mortgagee. The note and Trust Deed are held by the Beneficiary until: (1) the Trust Deed is assigned; (2) it is paid; (3) it becomes in default and must be foreclosed by Trustee's sale.

If the Trust Deed is assigned the printed form "Assignment of Trust Deed by Beneficiary" is used. This instrument is filled out, signed, acknowledged and recorded in the same manner as an assignment of mortgage. No notice to the Trustee is required other than by the recording of the assignment in mortgage records. The note is endorsed and delivered to the assignee with the Trust Deed.

If the indebtedness is paid, the Beneficiary (or assignee) completes and signs the "Request for Full Reconveyance", which appears on the trust deed form, and delivers the Trust Deed and the cancelled note or notes to the Trustee, with any other papers, such as fire insurance policies, which are to be returned to the borrowers. Upon payment of a nominal fee, five dollars , the Trustee will execute a "Trustee's Deed of Reconveyance", and deliver it to the parties named by the Beneficiary in the Request for Full Reconveyance. The recording of this Deed of Reconveyance in mortgage records will clear the title of the property from the lien of the Trust Deed. It is thus equivalent to a satisfaction of mortgage. Careful note must be made that the Trustee for its protection will retain the original cancelled note and Trust Deed in its file as its authority for executing the reconveyance to the borrowers. If Grantors desire copies they must procure them from the Trustee.

The principal difference between a Trust Deed and a mortgage is in the method of foreclosure. In

foreclosing a mortgage an attorney brings a court action to foreclose the mortgage, the necessary parties are served as in any legal proceeding, a decree of foreclosure is entered, the property is sold by the sheriff, and after one year from the sale (redemption period) a sheriff's deed is issued to the purchaser, if the property is not redeemed.

In the case of a Trust Deed, if a default occurs, the Beneficiary or assignee sends a request to the Trustee to foreclose the Trust Deed by Trustee's Sale, who executes a "Beneficiary's Notice of Default and Election to Sell." This notice includes a description of the Trust Deed and of the property, states that a default has occurred and that the Beneficiary has declared the entire obligation due and payable, and sets out the sums owing. It gives notice that the property will be sold by the Trustee at a time and place named in the notice. This Notice of Default must be recorded in mortgage records more than 120 days prior to the sale.

The Trustee must mail notice of sale to the proper parties at least 120 days before the sale, publish notice of sale for four weeks and have the notice personally served on the occupants of the property or posted on the property if it is unoccupied. The Trustee then at the time and place set sells the property to the highest bidder, and gives the buyer a "Trustee's Deed." In this sale there is no court proceeding, no period of redemption, and no deficiency judgment against the Grantors (borrowers).

However, the Beneficiary, but not the borrower, has the option of bringing a judicial foreclosure by a court proceeding, and in this case the borrower will have the same one year redemption period as in a mortgage foreclosure, but the lender Beneficiary cannot take a deficiency judgment.

Thus the foreclosure by Trustee's sale eliminates the court proceeding and allows the buyer to obtain a deed following the Trustee's sale without having to wait out a year's redemption. In the ordinary case the Trustee's sale should be completed in five months instead of the fifteen to eighteen months required for a mortgage foreclosure.

The Trust Deed Act allows the Grantor, or a subordinate lien holder, at any time between default and the sale, to pay the amount of the delinquency then due, plus the Beneficiary's costs and expenses, together with a Trustee's and attorney's fees not exceeding $50. If this is done the Trust Deed is reinstated.

Payments on the note are made by the Grantors to the Beneficiary, not to the Trustee. The Trustee is not obligated to execute a reconveyance unless requested to do so in writing by the Beneficiary or its assigns. Thus, under the Act, no active duty is imposed on the Trustee, except to execute a reconveyance upon written request of a Beneficiary or its assigns, unless there has been a default and the Trustee is requested to commence foreclosure.

Foreclosure of a Trust Deed by advertisement and sale or by judicial procedure shall be commenced within the time limits for mortgages.

Advantages of the Trust Deed:

To the lender—the principal benefit is the short foreclosure period.

To the borrower—an increase in available mortgage funds, elimination of possibility of a deficiency judgment, and the right to cure a default at any time before sale by payment of the delinquency plus nominal costs.

FEES FOR ACTING AS TRUSTEE UNDER TRUST DEEDS

1. Reconveyance Fee
   Full or partial reconveyance ..... $ 5.00
2. Fee for Trustee's Sale
   In addition to expenses actually incurred by the trustee for title search, recording, mailing, posting, service and publication of notice of sale, the following:

   a. For completed sale, trustee's fee computed as in ORS 86.795 as follows:
      - 3½% of any amount up to $1,000.00
      - 2% of all above $1,000.00 and not exceeding $10,000.00
      - 1½% of all above $10,000.00 and not exceeding $50,000.00

      Above fee shall be computed on the amount due on the obligation, both principal and interest, at the time of the trustee's sale.

   b. For cancellation prior to recording notice of default 25.00

   c. For cancellation after recording notice of default 50.00

It should be noted that the fee for cancellation of a default is that paid the Trustee. The law provides for a similar fee for attorney, plus necessary costs.

OPEN-END MORTGAGE

Depending upon the requirements of the lender and the needs of the borrower, mortgages and trust deeds vary in their terms.

The "open-end" provision is frequently used to assure the borrower of future monetary advances, the advances to be secured by the original obligation and security instrument.

A question immediately arises as to whether the advance will be a prior lien, as against a junior lien holder. The answer apparently rests on the terms of the contract—whether the lender is obligated to make advances, or whether he simply reserves the right to do so.

An Oregon court decision held as follows:

"(1) if a mortgagee is obligated to make advances to the extent of a sum stated in the mortgage, the lien of the mortgage is security for all such advances, whether made before or after notice of subsequent encumbrances;

"(2) If the mortgagee is not obligated to make the advances, the mortgage lien attaches only to such advances as are made before notice of the junior encumbrance."

In the latter case, lenders should have a title search to check for intervening liens before the advance is made.

PREPAYMENT PENALTY DISCLOSURE

New legislation now requires a full disclosure of any prepayment privilege penalty attached to any mortgage or trust deed securing a loan on real property for a period of more than three years.

The statute provides that the maximum penalty for the first year and each year thereafter be "expressly and clearly" stated on the loan agreement and promissory note.

"Loan agreement" is defined as a written document which sets forth the terms upon which the loan will be made. It does not mean a mortgage or trust deed which secures a promissory note. The statute, however, requires the disclosure on the note.

Violation of the statute makes the prepayment penalty provision void.

ASSUME OR SUBJECT TO

When purchasing or selling the title to real property, which is subject to either a mortgage or trust deed, it is important that the intent of the parties, with respect to such encumbrance, be clearly and definitely understood. Careless use of words in an earnest money agreement or in a deed of conveyance, will sometimes result in either the grantee assuming a liability which was not intended, or will result in no assumption of such liability, contrary to the intent of the parties.

When real property is subject to a mortgage or trust deed it is used as security for a debt. The debt is evidenced by a note, which is a negotiable instrument and is an obligation and promise to pay by the maker. If the title to the real property upon which the mortgage or trust deed is a lien is conveyed to someone else, such conveyance does not change the obligation of the original maker of the note. One who sells title to real property cannot assume that by such sale he will be relieved of the obligation to pay.

It is often agreed between a seller and buyer that the purchaser will assume and pay the obligation. Such an agreement between the parties will have the effect of subjecting the purchaser to personal liability for the debt but will not in itself relieve the original maker. Such agreement must be clearly expressed as to the intent of the parties.

Usually the express words which constitute the contract and subjects the purchaser to such liability are contained in the deed of conveyance. The mere fact that the purchaser continues to pay, or seeks an extension of the loan, will not in itself subject the purchaser to personal liability. The words must be express in that the intent must be manifested that the grantee will assume and agree to pay the debt.

Deeds of conveyance take on many forms, and a deed which merely "excepts" a lien of a mortgage or trust deed will not result in the assumption of personal liability. Also, a deed which makes exception of the lien and then adds "which the grantee agrees to pay", does not impart personal liability.

A deed which says "subject to a mortgage which grantee *assumes* and agrees to pay", will result in the assumption of the obligation.

Often, a purchaser will enter into an extension agreement with the holder of the mortgage or trust deed, to extend the obligation for another period of time. If a new note is not made and if the agreement is silent as to the assumption of the debt, then the agreement will not result in personal liability being assumed by such purchaser.

Such an extension agreement will have another effect, however, and that is, it will relieve the original maker from liability unless he consents to the extension. The original maker can also be relieved by an assumption agreement which is often entered into between the purchaser and holder of the note upon the sale of the title to real property.

A signed release to substitute a new mortgagor is not unusual, particularly under FHA insured financing.

WATER BILL NOT A LIEN

In the closing of real estate transactions it sometimes is necessary to determine if a charge for services is a lien on real property. A simple test is always applied—and that is, can the real property be sold to satisfy the charge?

A common example of such a charge is a water bill. A mistaken concept is that a water bill is a lien against the real property and can be enforced against the premises. This is not so, because no levy can be made against the property to sell the same to satisfy the charge. The service can, however, be cut off until such time as the charge is paid.

Because of this right to refuse water services, care should be exercised to ascertain if such bills have been paid. Inasmuch as a service charge is not enforceable against the real property and is not a lien thereon, a title search will not disclose a delinquency, if one exists.

Liens

Liens are special encumbrances which make real property security for the payment of a debt or obligation, such as mortgages, trust deeds, taxes and judgments. An encumbrance is anything which affects or limits the fee simple title to the property. To those listed under "liens" can be added easements or restrictions of any kind.

Liens created by law are known as "statutory liens." The lien created by mortgage is an "equitable lien." The latter is not a right in the land itself, but personal rights or obligations against the owner or grantor of the property.

Stated simply, encumbrances are those rights or interests against property which diminish the value of the owner's interest in the property, but generally do not restrict or impair his powers to convey the property subject to the encumbrances.

Generally, they may be grouped in two classes. First, those which limit the use of the land or grant certain rights to the use of the land to third parties; and, secondly, those representing a monetary charge or obligation owing by the owner and for the pay-

ment of which the property has been pledged or is otherwise obligated.

The first group of encumbrances referred to above include easements granted by the owner of the property to provide a right of way for access to adjoining property, or easements for utility lines and other similar purposes. Also in this classification would be the familiar form of building restrictions which limit the use that the owner may make of his property. It should be stated here that a zoning ordinance of itself is not an encumbrance against property.

We will not be concerned with encumbrances of this first general classification, but rather our consideration will be limited to encumbrances of the second group, that is those involving a monetary obligation. Encumbrances, or liens, of this latter classification may also be subdivided into two broad groups.

INVOLUNTARY LIENS—TAXES

The first of these groups is involuntary liens, that is those arising out of no voluntary or willful act of the property owner, but which result—oftentimes without the owner's consent, in a lien or charge against his real property. This lien may be specific as to a particular piece of real property or it may be general so as to include any real property owned by the person obligated to pay the money involved.

Under this heading is included most of the various tax obligations which may be charged against the property. The most common tax obligation is the regular year to year assessment of ad valorem (meaning by value) taxes which are levied by the assessors in the various counties of the state for the purpose of providing funds for local government.

In many states the tax levying divisions of local government levy and collect taxes separately. In Oregon these several districts prepare budgets and present them to the County Assessor whose duty it is to determine the total amount of tax to be levied against each parcel of property.

The annual tax roll includes the obligation of each property for all the various units of local government. This may include the county, a city if the property is within the city limits, a school district, a fire district, water district, flood or drainage district, sanitary district and any of several other special districts authorized by Oregon law and given the power to levy taxes for the support of their activities. It is apparent then, that in order to anticipate what the year to year taxes may be with respect to a particular property you should first know the various taxing districts within which it is situated and current budget plans.

ASSESSMENTS

In addition to this annual levy for ad valorem taxes many of the taxing districts in Oregon are authorized by law to levy special assessments for local improvements. These assessments are distinguished from general taxes in that general taxes are presumed to benefit all property within the taxing district equally, whereas the special assessments are levied only on particular pieces of property because of the peculiar benefit that the assessed property may derive from the contemplated improvement. The most common assessment of this type is the street assessment levied by the city government. There are many others, including sewer, water, diking and so forth. These assessments are specific in nature based upon the actual cost of the particular project and are distributed among the various affected properties, as nearly as possible in proportion to the benefit. Thus, in the case of street assessments, the total cost of the improvement is distributed on a front foot basis among the properties abutting the street. Similarly the installation of sewer facilities and the cost of the installation of water mains will frequently be assessed to the affected properties on a front foot basis.

BANCROFT ACT

In recent years the counties have been granted authority to improve county roads outside the corporate limits of cities or towns on an assessment basis and distribute the cost to property owners abutting the improvement. The Oregon law provides with respect to most of these assessments that the property owner may upon request be permitted to pay them on an installment basis. In the case of city assessments for streets and sewers, this is generally referred to as the Bancroft Act. At any given time you will be concerned to know what the unpaid balance owing on such an asssesment may be and whether the required installments have been kept up to date. In the event of the sale of property affected by one of these assessments, the unpaid balance can be paid out of the purchase price at the time of closing the sale, or the purchaser may assume the unpaid balance and pay off the installments as they come due. County road improvement assessments can also be paid in installments, but over a somewhat shorter period.

AUTHORITY TO FORECLOSE

In the event that the property owner fails to make payment of the amounts due either with respect to the ad valorem taxes or special assessments for local improvements, the law permits the levying body, county or city as the case may be, to institute a suit to foreclose the lien of such tax or assessment and cause the property to be sold to satisfy the obligation.

Oregon law affords to the delinquent taxpayer a variable period of time within which he may redeem from the foreclosure sale and re-acquire title to his property. In the event of his failure to redeem within the time provided the title will vest absolutely in the purchaser at the foreclosure sale, which is usually the taxing unit of government.

In fixing liability between a buyer and seller it is sometimes important to determine the time when a particular levy or assessment becomes a lien against the property. This time may vary depending upon the nature of the assessment. In Oregon, by statute, the tax year for a general ad valorem tax on real property is a fiscal year beginning on July 1st and ending June 30th of the succeeding year. By law the real property taxes for any given year become a lien against the property on July 1st of that year, although the tax statements may not be delivered to the property owner until sometime after the 15th of October of the sam[illegible] When taxes have been

paid in full it will cover the period up to June 30th of the succeeding year.

Assessments for special improvements are governed by the action of the body imposing the lien. In the case of city liens, the lien against the property for street improvements is usually imposed through an ordinance adopted by the city council and usually becomes a lien on the property on the day that a final ordinance fixing and determining the amount is finally approved by the council. The procedure on county road improvements is somewhat different. These assessments may become a lien against the property before the work has actually been performed. The law in this instance provides that after holding the necessary hearings, the county court may make an order directing that the improvement be made. The ultimate lien for the cost of such improvement attaches against the property as of the date of entry of the order to improve.

PERSONAL PROPERTY TAXES

Another classification of local taxes you will have occasion to deal with regularly in the conduct of your business is the tax on personal property. These taxes are assessed in substantially the same manner as general taxes on real property but the tax year is the calendar year from January 1 to December 31, although the bill usually comes out in October or November at the same time as the real property tax bill.

The law in Oregon provides two ways in which the tax collector may obtain a lien against real property to enforce collection of delinquent personal property taxes. First, the tax collector may issue a warrant for the delinquent personal property taxes and cause a copy of this warrant to be filed with the county clerk. When such a warrant is filed it has the effect of a judgment against the delinquent taxpayer and without further action becomes a lien against any real property the taxpayer may own within the county. The lien thus obtained will have a priority dating from the time of filing and collection may be enforced by the tax collector the same as any judgment creditor may proceed to collcet his judgment.

The second means by which the tax collector may obtain a lien on real property for delinquent personal property taxes is by a procedure known as "attaching" or "extending" the delinquent personal property taxes on the real property tax rolls. Oregon law authorizes the tax collector any time he deems it necessary to insure collection of delinquent personal property taxes to select any piece of real property within the county owned by the delinquent taxpayer and to extend upon the real property tax rolls the amount of the unpaid personal property taxes. From the date that such notation is made on the real property tax rolls the personal property taxes become a lien upon the particular parcel of real property thus selected. In this instance, if they continue unpaid, collection would be enforced as in any other case of foreclosure of delinquent taxes.

STATE AND FEDERAL TAX LIENS

In Oregon as in most other states the laws also provide a means whereby the state or federal government may obtain a lien against real property to enforce collection of unpaid tax obligations owing by the property to those branches of government.

The method provided both in the case of delinquent taxes owing the state of Oregon and in the case of delinquent taxes owing the United States is somewhat similar to the first procedure outlined above for the collection of delinquent personal property taxes, that is, the law provides for the issuance of a warrant or of a notice substantially similar to a warrant, and for the filing or recording of this warrant within the county in which the land is situated. The law provides that the claim of the taxing agency will become a lien against any property within the county owned by the delinquent taxpayer from the date of filing such claim or warrant.

This procedure to enforce collection of delinquent taxes has become a favorite method because of the virtual guaranty of collection that goes with it. Once a warrant has been filed within the county giving notice of a delinquent tax obligation owing by a property owner, it is virtually impossible for that taxpayer to sell or mortgage property without first satisfying the tax claim. In a great many instances claims for delinquent taxes are collected through the rather simple procedure of filing a warrant or notice and then waiting for a title insurance company to disclose the lien upon a title examination. Since to actually pursue the taxpayer and enforce collection by whatever procedure was available might be a slow and expensive process for the tax levying body, literally thousands of these warrants or notices are filed each year in the various counties throughout Oregon and in a great many instances they facilitate the collection of taxes which might otherwise go unpaid. The subject of tax liens is a large field but an important one and you will find an understanding of how these claims arise and how they may be discharged to be of great help to you in the day to day pursuit of your business.

JUDGMENTS

The subject of involuntary liens also includes money judgments.

Judgments are principally of two types and arise out of litigation wherein the property owner has been an unsuccessful party and which has resulted in a money claim against the property owner in favor of some other person. This judgment may be for a sum of money due either in a lump sum or in installments, or it may be for a nominal amount resulting from a situation where the property owner has been an unsuccessful plaintiff and in denying his claim the court has given a judgment in favor of the adverse party for the costs incurred. In any case the judgment, from the time it is docketed within the county, will be a lien against any real property which the judgment debtor owns or which he may subsequently acquire during the life of the judgment.

Lump sum judgments will frequently be the result of litigation between parties involving some contractual obligation of the property owner. In recent years another very common source of such judgments is litigation arising out of an automobile accident. Judgments payable in installments over an extended period of time, either for alimony or for child support

arising out of marital troubles have become a very considerable factor in the past few years. In addition to the lien of judgments arising out of litigation within the county in which the property is situated, the law also provides a means whereby a person obtaining a judgment in one county may have a transcript of that judgment prepared and filed in any other county within the state in which the judgment debtor obtains property, and thus obtain a lien against that property.

The lien of a judgment once obtained is usually good for a period of 10 years. Generally speaking the lien thus obtained against real property by the judgment debtor can be removed by payment and satisfaction, by expiration of the ten year period including its extension, if extended, or by obtaining a release from the judgment creditor whereby he releases all property or a particular piece of property from the effect of the judgment. In some instances, through appropriate proceedings, the lien of a judgment may be discharged as a result of bankruptcy of the judgment debtor.

PRIORITY OF JUDGMENT

Oregon law requires the clerk to note "the day, hour and minute" of the docketing of a judgment; and provides that the judgment is a lien from the "time" of docketing and not the "date" as was previously the case. The time of day a judgment is docketed will determine the priority of judgments entered on the same day.

MECHANIC'S LIENS

There is one further type of involuntary lien which is fairly common and with which you should be familiar.

The Oregon law provides that any person or firm supplying material or labor for the construction, improvement, alteration or repair of real property or structures thereon shall be entitled to a lien against that property to secure payment of the money due him for such material or services supplied. This law provides for the inclusion of almost every type of material or labor furnished in connection with the improvement of the real property or structures as long as the material becomes permanently affixed to the land. For an illustration of the distinctions which are made in this type of lien—materials or labor furnished for the structural parts of the building and all electrical and plumbing fixtures incorporated therein would properly be included in such lien.

Materials and labor used in the construction of portable fixtures moved onto the premises and not attached would not properly be included in this type of lien.

The law provides that such a supplier has a period of 60 days in the case of an original contractor, or 45 days in the case of any other supplier, from and after completion of the work within which to file a notice of his claim. When such a lien has been properly prepared and filed it becomes a charge against the property dating back to the time that work was commenced. It is universally recognized as having a very high priority. For example: You might have a situation where work on a new dwelling was commenced on July 1st; on August 1st the builder placed of record a mortgage; on September 1st work was completed and October 25th the general contractor, not having been paid, files a notice of lien. Assuming that the lien is properly prepared and filed and assuming that all of the parties have acted in complete good faith, in the event of foreclosure of the builder's lien his priority would date from July 1st, the date of commencmeent of the work and his claim would be prior to that of the holder of the mortgage recorded on August 1st.

The notice of mechanic's lien claim of this type is filed with the county clerk. The lien is good for a period of six months generally, within which period if the claim has not been paid the lien claimant must institute proceedings to foreclose the lien or his lien against the particular property will be lost. In certain special instances the time within which foreclosure may be commenced may be extended up to a maximum of two years. Liens of this sort, as in the case of other liens, may be discharged by payment and satisfaction, by release of all or part of the property, or, of course, would be extinguished in the event of an unsuccessful attempt to foreclose the lien.

A 1967 amendment to the law changed from 7 to 10 days the period in which any person furnishing materials or supplies to be used in the construction of an improvement must furnish notice to the owner or mortgagee of such delivery to a contractor. A person furnishing labor in addition to material does not have to give this notice.

Upon demand of an owner or mortgagee of the property, a supplier of materials must furnish a list to the owner or mortgagee of the materials delivered and the amount due. Failure to do so waives his statutory preference.

SOME UNUSUAL LIENS

Among statutory liens in Oregon are the following:

CROP LIEN—A lien on the first crop for cost of furnishing seed, commercial fertilizer, or chemical weed eradicator. The property is bound by this lien for 12 months.

INNKEEPER'S LIEN—A lien on baggage, clothing, jewelry or other property if the proper charges are not paid. The property can be sold 60 days after publication of notice.

LANDLORD'S LIEN—A lien on all personal property, except wearing apparel, if rent is not paid within 20 days after due date. The lienor can take possession of the property and sell after 90 days.

LIEN FOR PREPARING LAND FOR CULTIVATION OR CONSTRUCTION—must be filed within 60 days and can be foreclosed in the same manner as a mortgage.

NON-POSSESSORY LIEN—A lien for labor and material expended on personal property. Lienholder has a lien for reasonable worth of his expenditures for one year. Must file notice with recording officer within 60 days of delivery of chattel to the owner.

NURSERYMAN'S LIEN—A lien on the land planted if the value exceeds $25. Foreclosure same as a mortgage.

POSSESSORY LIEN—A lien for labor or material expended on personal property. Lienholder may retain possession and sell if charges not paid within 90 days.

VENDOR'S LIEN—A lien to which a seller is entitled when he has conveyed a parcel of real property to a vendee and has not been paid the full purchase price of the property. Enforceable by foreclosure.

VOLUNTARY LIENS—MORTGAGES

The customary type of voluntary lien against real property in Oregon is the mortgage. In your consideration of voluntary liens it is suggested that you review the "trust deed" portion of this section.

The normal mortgage transaction usually involves two parties, the borrower designated as the mortgagor and the lender designated as the mortgagee. In Oregon this is a traditional method of giving a lien upon real property to secure the payment of an obligation owing by one party to another.

The debt or obligation owing between the parties is expressed by a separate instrument, a promissory note. Because this note is a negotiable instrument and an assignable asset, it must contain an unconditional promise to pay; be in writing; be made by one person to another; be signed by the maker; engaging to pay on demand or at a fixed or determinable future time, a sum certain in money; to order or to bearer.

The mortgage is the instrument through which the lender obtains a lien on real property to secure the payment of the debt.

It is important that the mortgage accurately name the parties, both mortgagor and mortgagee, that it describe the debt with sufficient particularity to enable a person reading the record to determine the amount of money owing and the manner and time of payment. It also is important that the mortgage describe with exactness the particular piece of real property which is being pledged by the mortgagor to secure payment of the obligation. In order that the mortgage may be recorded so as to impart constructive notice to third persons dealing with the land, it is necessary that the mortgage be properly acknowledged by the mortgagors before a notary public or other officer authorized to take acknowledgments. The part of the mortgage that is "acknowledged" is the signature of the mortgagor.

Some clauses, desirable to one or other of the parties, are frequently found in the mortgage, such as the "fire insurance clause", which protects the mortgagee in the event the premises on which he has his mortgage are destroyed by fire; the "receiver clause", used in some jurisdictions to prevent dissipation of the asset that secures the loan, such as abandonment by the mortgagor or loss of good will or retention of profits from the property; the "prepayment", which permits the mortgagor to pay the entire or stated amounts of the principal any time he chooses before due date; the "acceleration clause", which permits the mortgagee to declare the remaining unpaid balance due and payable upon default in a payment; or the "partial release clause" used with a blanket mortgage to free from the lien individual parcels of real property upon payment of a stated sum.

Once the mortgage has been properly acknowledged and recorded in the mortgage records of the county in which the real property is situated, the mortgagee obtains a lien against that property which will continue until it is released by payment or by foreclosure sale, and the execution of a "satisfaction piece" by the mortgagee or the court; or until barred by the statute of limitations. In some instances a mortgagee can release the lien other than by payment, but the "satisfaction" must also be made a matter of record.

The lien of the mortgagee will be determined generally as of the date of recording the mortgage. In the event that the debt is not paid and it becomes necessary for the holder of the mortgage to foreclose his lien, his claim will be prior to that of any other person who has obtained a lien against the property subsequent in time to the date of recording his mortgage. Thus second or third mortgages may be eliminated in the event of a default on the first mortgage and a proper foreclosure by the holder of the first mortgage. Under the recording statute of Oregon the first person who records his mortgage has the first lien. Without this rule, there would be an open door to fraud.

As to federal tax liens, both the U. S. Supreme Court and the Oregon Supreme Court have held that a federal lien takes priority over an inchoate lien. An inchoate lien is one that is imperfect or unfinished. Such inchoate liens are exemplified by mechanics liens or attachments. Here the amount and the final determination of the lien is contingent upon the outcome of litigation.

Some liens, such as taxes and assessments, take priority over contractural and statutory liens regardless of the date of entry. These liens are always prior to other liens of record.

A mortgage is a contractural lien and even though it may be considered as inchoate, because in order to enforce it, it is necessary to foreclose the lien, by statute such a lien is given priority over federal tax liens.

The President on November 2, 1966, signed into law the Federal Tax Lien Act, which restores the priority of all obligations secured by a mortgage over federal tax liens filed after the mortgage is executed and recorded. The new law removes much confusion over priority of a federal tax lien.

Liens are released in various ways when they are secured by real property. Some expire after a certain length of time, such being determined by the statute which provides for the specific lien. And, of course, a lien is released upon the execution of a satisfaction or release by the holder.

FORECLOSURE SALE

The object of the foreclosure is to sell the right, title and interest in the property which the mortgagor had at the time of the execution of the mortgage. Parties whose claims are adverse or superior to that of the mortgagor are not affected by the decree, but good practice generally adopts the following sequence of events:

1. Title search is made so that any person having a possible interest in the property and who

might be adversely affected by the foreclosure may have their "day in court."

2. A lis pendens (notice of pendancy of action) is prepared and filed with the county clerk or recorder. At the same time a summons and complaint are served on the parties.
3. The court directs that the foreclosure sale be advertised (once a week for four consecutive weeks) and that at the expiration of this time the property be sold at public auction.
4. A writ of execution is then issued authorizing the sheriff to sell the property.
5. The property is sold and a certificate of sale is given by the sheriff to the purchaser.
6. Beginning of the redemption period. At any time within one year from the date of the sale, the mortgagor or others acting for him may redeem the property by paying the purchaser the purchase price, 6 per cent interest, the amount of taxes or other assessments paid by the purchaser, a reasonable sum for fire insurance, maintenance, upkeep or repair of any improvement, and 6 per cent interest on these costs.

Another lien creditor may also redeem the property within 60 days of the sale by paying the purchase price plus 10 per cent interest per annum, and the other costs with like interest.

In addition to the claim against the property to secure the payment of the debt, generally the mortgagor is also held personally liable for the full debt, whether or not the sale brought a sufficient amount (deficiency judgment).

It is quite common in Oregon for a purchaser of real property to "assume and agree to pay" an existing mortgage. In such cases the purchaser also will become personally liable for the payment of the debt. When a purchaser buys "subject to" an existing mortgage he is held to have only purchased the equity.

In the event that the indebtedness is not paid when due and foreclosure by the mortgagee results, the original mortgagor, and any subsequent owners of the property who have assumed and agreed to pay the debt, may be held personally liable in the event that a sale of the property does not produce sufficient funds to discharge the entire balance owing on the mortgage, including interest and costs of foreclosure.

In the case of a sale of property by "A" to "B" and a mortgage given by "B" back to "A" for the unpaid balance of the purchase price—a "purchase money mortgage"—Oregon law will not permit a deficiency judgment, but foreclosure proceedings are the same as those for the commonly used mortgage. The purchase money mortgage is merely an extension of credit by the seller to the buyer.

Deed in Lieu of Foreclosure

Under certain circumstances, mortgagors unable to continue mortgage payments may wipe out the debt and the possibility of a deficiency judgment by executing a "deed in lieu of foreclosure".

The deed, of course, gives the mortgagee only the title in the property of the mortgagor in default but is faster than a foreclosure and eliminates the statutory one year redemption period.

Such a deed states that the conveyance is made because the mortgagor is in default, that he can not make his payments and desires to discharge the indebtedness.

RIGHT OF REDEMPTION

As already pointed out, owners of real property are at times faced with the loss of title by reason of involuntary sale of their interest in the property.

When this happens there is usually protection and relief from such sales either in law or equity.

It is generally held that in the absence of contract, the right to allow redemption only extends to cases provided for by statute, though equity courts, in their effort to provide fair treatment to all parties, have sometimes allowed it in other cases.

Presently in Oregon there are three accepted methods of purchasing real property on credit. They are:

1. By contract of sale.
2. By mortgage.
3. By trust deed.

The contract of sale is subject to foreclosure; however, such foreclosure is not a legal action but an action in equity. Because of this there is no statutory right of redemption upon foreclosure but a court of equity will usually allow a reasonable time for the vendees to redeem.

It has been held in Oregon that "the time allowed for redemption in strict foreclosures must be determined from the facts in each case. It is largely a matter of discretion of the court." Periods of redemption have varied, but have usually been about 60 days, although some have been for as long as one year after the decree of foreclosure.

The rights to redeem under a mortgage foreclosure are specified by statute. The period fixed is one year after the date of sale. If a deficiency judgment has been procured against an original maker of the note, then such person has an additional 10 days after the expiration of the year in which to redeem.

The statute also provides for redemption by junior lien holders who may redeem from such sale. Such creditors must redeem within 60 days of the date of the sale, but if there are several junior lien holders, each may redeem within a 60 day period of each prior redemption. If a junior lien holder redeems he must pay off all prior liens against the property.

If the original maker of the note redeems, then all liens against the property are reinstated as of the date of foreclosure.

The statute which provides for financing through use of the trust deed does not provide for redemption in the event a foreclosure sale is conducted by the trustee. Such sale is a nonjudicial sale so there is no equitable relief which can be granted. There is, however, a waiting period under the trust deed foreclosure procedure which is tantamount to a redemption period. The law provides that a sale cannot be had until the expiration of at least 120 days after the notice of default is recorded.

The same rights of redemption apply where other creditors have effected a sale of the property, such as mechanics lien claimants and judgment creditors. The rights of such claimants are legal rights and therefore a "right of redemption" exists.

In tax foreclosures the owners may redeem as provided by statute, within one year of the date of the decree.

TITLE INSURANCE

The standard form title insurance policy in use in Oregon contains certain printed exceptions relieving the insurer of liability on account of liens of certain types that are not disclosed by the public records. Principally these exclusions cover claims arising out of material or labor liens no notice of which is of record at the time of the issuance of the policy, and street or other special assessments which have not yet been extended on the public records. Because of the fact that your buyer's title insurance policy will not afford him protection against these items, it is important that you make an inspection of the property and be in a position to advise the purchaser as to whether street or sidewalk work has recently been done, sewer facilities installed, or repairs, alterations or remodeling work done on the structures. If work is in progress at the time of the sale, it is particularly important that the purchaser be aware of the hazards that are involved in order that he can take the necessary steps to protect himself against loss on account of subsequent liens.

SUPPLEMENTARY REAL ESTATE INSTRUMENTS

Real estate transactions involve the use of a great many instruments or documents. The primary instruments are the mortgage, trust deed, contract, deed and the lease.

Frequently the real estate broker will handle one or more supplementary instruments in completing a transaction. Most of these supplementary instruments have to do directly with a disposition of the primary instruments. Examples are the assignment of mortgage or trust deed; the estoppel certificate, in which a mortgagor makes a signed declaration of the amount due on the mortgage and whether or not he has a defense to a foreclosure; and the very important instrument for recording the satisfaction of a mortgage. A power of attorney given in a situation involving real property is a supplemental instrument.

In the main, supplementary real estate instruments exist or come into being through clauses or specific statements in the primary instruments, although many are statutory.

Q. 11 What is the name given to a past due mortgage that is subject to foreclosure any time?

(A) first mortgage
(B) blanket mortgage
(C) open mortgage
(D) any of the above

Q. 12 The funds for a loan secured by a trust deed are supplied by:

(A) the grantor
(B) the escrow agent
(C) the trustee
(D) the beneficiary

CONTRACTS

To the businessman in general, and to the real estate broker and salesman in particular, the law of contracts and knowledge of the use of the contract as the basic legal instrument of trade and commerce is very important.

Throughout this Primer, reference is made in many sections to some phase of a "contract". Now, what is a contract? Very simply stated it is "a promise which the law enforces as binding".

A contract must contain certain essential elements, and so that these elements can be more easily identified we might define a contract, as many texts do, as "an exchange of promises or assents by two or more persons, for the breach of which the law gives a remedy, or the performance of which the law in some way recognizes as a duty".

When we use the shorter definition that a contract is a promise which the law enforces as binding, we recognize that a contract can be "expressed" or "implied". It can be written or oral. If a promise of one party is given in exchange for the promise of another party it is a "bilateral" contract. It is "unilateral" if one party promises something to induce the other to act, such as the promise to pay a reward for recovery of a lost dog.

When both parties have fully performed under a contract it is said to be "executed". When something remains to be done by either party it is "executory". A contract is "valid", "void", or "voidable". A contract binding and enforceable against both parties is valid. A void contract is simply a non-existent contract, and a voidable contract is one binding and enforceable on its face, but one in which one party usually has an option to void or validate as he chooses and subject to certain conditions. In real estate we usually encounter voidable contracts in transactions involving a minor.

ESSENTIAL ELEMENTS

In order that there be a contract there must be:

1. Competent parties.

2. Offer and acceptance.

3. A lawful object.

4. Valid consideration.

5. Be in writing and be executed by the parties to satisfy the Statute of Frauds. (This is a necessity only in real estate and certain other specific contracts.)

It is important in any contract that there be a "meeting of the minds". There must be actual offer and acceptance with all parties furnishing legal consideration.

Misrepresentation, if proven, is grounds for recission of a contract.

It is of additional importance to add that the parties must be identified, that the assent be genuine (not obtained under fraud or duress), that the subject matter be identified, and that the terms be definite and certain, and that the contract be dated.

Real Estate Contracts

In addition to the so-called "land contract", which will be discussed under that heading, there are three principal types of contracts commonly used in real estate brokerage. These are (1) the Listing Agreement and Employment Contract, which is the contract employing a broker to buy or sell real estate for compensation or commission, (a great many forms of this contract are available, such as residential, commercial, farms, exchanges, etc.); (2) the Earnest Money Receipt or Agreement, which, when properly prepared, is the contract for the sale of real property or of an interest therein, (this document actually becomes a contract between three parties - seller, buyer and broker); and (3) contracts for the lease of real estate for a period of more than one year.

As is the case with deeds, Oregon has no statutory contract forms. Real estate brokers and salesmen, however, use standardized printed forms as the principal documents of their daily business transactions.

THE CONTRACT OF SALE

An agreement for the sale of real property is within the Statute of Frauds and <u>must</u> be in writing in order that it not be void.

In order that it not be held void for lack of some essential,

it must be definite and certain in its necessary particulars. The contract must designate the parties, identify the subject matter with certainty, set forth the terms and conditions, express the consideration, and be signed by the parties to be charged.

All too frequently employment contracts are carefully drawn until the blank space for the commission percentage to be paid the broker is reached. Here the blank is not filled in. It has often been repeated that the courts will not attempt to "write a contract", and that in the absence of any single essential it is void.

It is of vital importance that everyone interested in a contract of sale of real property be designated with all possible certainty. All parties having an interest in the fee should be bound by the contract so that any decree for specific performance will affect all persons required to execute a deed sufficient to convey marketable title.

"Specific performance" under a contract refers to an order of the court to do specifically what a party to a contract promised to do.

An individual, other than the person holding the legal title, who has a life estate in the property should join in the contract of sale as one of the sellers.

CAPACITY AND AUTHORITY

The capacity and authority of the seller to execute the contract must be thoroughly determined and identified. Examples:

If the seller is a minor the contract must be executed by the duly appointed guardian. A minor has the option of declaring a contract valid or void when he reaches the age of maturity.

If the estate of an intestate descendant, it must be executed by an administrator.

If by a seller as a fiduciary named under a will, a trust or agency agreement must be shown.

DESCRIPTION

The principle that a contract for the sale of real property must be definite and certain applies to both the terms of the agreement and the legal description of the real property. An insufficient description may render the contract void under the Statute

of Frauds or other pertinent statutes.

The property should be described so that it is readily identifiable. Sometimes it is not possible to get a complete and accurate legal description. Oregon courts have been liberal in this essential, but as a minimum it should show clearly the quantity and location of the lands to be transferred. The courts have held a description to be sufficient if the property can be identified by a competent surveyor. When a legal description cannot immediately be had it is good practice to refer to a separate document, such as the public record, thereby making such a reference a part of the contract.

LAND CONTRACTS

As we have seen, contracts of sale are the basic legal instrument in almost every real estate sale transaction.

Through common usage, however, we have come to consider sales of real property, other than for cash, as being negotiated through the medium of either the mortgage, trust deed, or the "contract of sale".

During periods of so-called "tight money" the use of the contract of sale is increased. In this context, the contract of sale, frequently known as a "land contract", refers to the special situation in which the seller agrees to sell for a price payable in installments over a specified period of time, and to execute a deed only upon full performance by the buyer. Full performance may be payment of the full purchase price, or a stipulated proportion of the purchase price.

RECORDING

In the event both real and personal property are being sold by the contract of sale, the contract should also describe in detail the items of personal property which are being sold. This can be done by either listing the items in the body of the contract of sale or by referring to an inventory attached to the contract of sale.

The ordinary contract of sale covering only real property in which the seller retains title need not be recorded, but if personal property is included the law requires that the contract of sale be recorded in the Conditional Sales Contract Records in the county in which it is located.

CONSIDERATION AND MANNER OF PAYMENT

Any contract which does not show the true purchase price and the manner in which it is to be paid, expressed definitely and clearly, is a sorrowful reflection on its author and most likely void.

Very frequently where property is being sold on contract of sale there is in existence, as an encumbrance on the real property covered by the contract of sale, a mortgage upon the property. In this event it is necessary that the contract of sale recite that the property is subject to the mortgage, describing the mortgage sufficiently so as to be identified. The contract of sale should further make it clear as to whether the seller or the buyer is to make payments upon this mortgage while the contract is in force and effect.

Another situation is where, instead of the property being subject to a mortgage, the seller owes money upon an existing contract of sale upon the property.

Where this situation exists the contract of sale should provide that the interest of the seller in the property covered by the contract is represented by the ownership of a buyer's interest in a contract of sale. The contract should, further, describe this contract of sale by parties, by date, and by balance due. Provision should be made as to which of the parties is to make the payments upon the existing contract.

POSSESSION

In the absence of agreement between the seller and purchaser the right to possession follows the legal title. The contract should express and specify as to delivery of possession to the purchaser and should definitely fix the date of such possession.

FORECLOSURE

In a suit to foreclose a contract of sale the court makes an interlocutory decree which decrees the amount due on the contract, gives to the buyer a specified time to pay in full the amounts found to be due, and provides that in the event of the failure of the defendant to pay said amounts that the defendant be foreclosed of all right in the property covered by the contract. If the defendant fails to pay the amounts due within the time allowed in the interlocutory decree, the court makes a final decree, which completely forecloses out all of the interest of the buyer in the property. Thus it is seen that the buyer in a contract of sale has no right of redemption. It is therefore, obvious that it is

to the advantage of the seller of the property to sell it on contract of sale rather than deeding the property to the buyer and taking back a mortgage for the unpaid balance. Oregon's trust deed law has the same advantages, plus some additional benefits to the purchaser.

In the event of a default in the payments under a contract of sale the buyer does not automatically and by operation of law lose all of his right in the property, nor does the seller have the immediate right to go into possession of the property.

There is no way whatsoever to take from the buyer his rights in the property save and except to foreclose the contract of sale, or the securing of some sort of a release from the buyer of his interest in the property.

WAIVER OF STRICT PERFORMANCE

If the seller in a contract of sale accepts any payment upon the contract of sale, even one day late, or if the seller accepts any performance on the contract of sale after a default by the buyer in the failure to pay taxes, or the failure to pay insurance premiums, the seller is deemed to have received the strict performance of the contract.

JUDGMENT

It is quite generally recognized that where a buyer in a contract of sale has a judgment of record against him, he can make an assignment of the contract of sale and a transfer of his interest in the real property covered by the contract of sale, without having the judgment vested as a lien on the property.

It is not so well known that this is not true where there has been recorded a Federal tax lien against the buyer. These liens vest on any type of interest or ownership of property.

FORFEITURE CLAUSE

In the event of a default in payments on a contract of sale, the seller is limited in his remedies by the forfeiture clause of the contract.

Some contract forms contain what is known as a self executory clause. Under this clause the sole remedy of the seller is to foreclose the contract.

If this clause is not present the seller is given the option to

determine whether or not he desires to forfeit all of the right and interest of the buyer in the property, or whether he elects to sue the buyer and obtain personal judgment against the buyer for the payments upon the contract of sale as they accrue.

ENTIRETY SEVERED

A little understood point of law relative to contracts of sale is the change in the position of husband and wife upon signing of a contract of sale.

Prior to the time of entering into the contract they held title in an estate by the entirety. When they entered into a contract to sell the property the nature of their ownership of the property changed. For purposes of distribution in an estate, and for other purposes, their ownership of the legal title is personal property rather than real property, and that interest passes in an estate as personal property rather than real property.

EQUITABLE CONVERSION

The effect of the execution of a "land contract" upon the legal title and upon the rights of the parties thereto is interesting because of a fiction known as "equitable conversion". This doctrine is recognized in Oregon and applies to various situations where such a conversion is rendered necessary by the equities of a case. Here we will discuss only the conversion which is the result of the execution of an executory contract for the sale of real property.

Briefly, the doctrine of "equitable conversion" is the change of property from real to personal or from personal to real. Such conversion when the result of the execution of a contract is entirely fictional and not physical. Conversion in a physical sense is a change in nature of real or personal property resulting from either an actual severance from or an attachment to land. An example of physical severance from land would be the cutting of timber or other crops, which while growing are considered real property but when severed become personal property. Conversion by attachment would be best illustrated by the connection of personal property to real property, such as the construction of an improvement on real property or the addition of some item considered personal property but permanently attached to a building thereby making it real property.

As applied to a contract of sale, upon the execution thereof the contracting parties change places. The buyer's interest is "land" and the right and interest conferred by the contract upon

the seller is "personal property". The seller has the right to receive the money and he also is the owner of the real property as trustee for the benefit of the buyer, who is referred to as the "equitable owner". Because of this conversion the rights of the seller in a contract of sale are not as assumed by the parties.

In as much as the seller's right is personal property, if the seller should die while said contract is in existence it would be treated as personal property in his estate. If the seller died leaving a will his interest in the property would be distributed as personal property to his legatees and not to his devisees.

Validity of Contracts Executed on Sunday

In the colonial days most of the colonies had laws which have, through the years, become known as "Blue Laws", or sometimes as "Sunday Laws". These laws, as a general thing, forbade certain things being done on the Sabbath. Among these things was the transaction of business and the execution of contracts. A few of the states of the union have such laws. Oregon does not have such a statute, consequently, agreements executed on Sunday are as valid as though they were executed on any other day of the week.

If Oregon did have a law forbidding the execution of contracts on Sunday, the mere dating of the contract on a different date, say Monday, would not in any manner add to the validity of the contract, and might very likely defeat a remedy for breach.

The date affixed as the date of execution on a contract is only prima facie evidence as to the true date. The date the actual execution took place can be presented as evidence verbally. The misdating of a contract will not accomplish anything.

The Statute of Frauds

The "Statute of Frauds" is the name of that law which requires certain agreements to be in writing and provides that if such agreements are not in writing they are void.

The sufficiency of earnest money receipts and listing agreements covering the sale of real property has been the subject of innumerable law-suits. Most licensed real estate brokers and salesmen know that an agreement concerning the sale of real property has to be in writing - but there are some who will argue.

General usage of the printed listing agreement and earnest money receipt or agreement has eliminated many controversies

concerning the sufficiency of a contract for the sale of real property. It should be remembered that an agreement to employ a broker to sell real property can only be consummated and evidenced by a series of writings or notes.

The importance of properly drafting a listing agreement or an earnest money receipt cannot be overemphasized. First of all, such an agreement MUST be in writing, otherwise it is void and not merely voidable. Only the writing is allowed in evidence and no other evidence is admissible to change the terms of the document. When such an agreement is drawn it must stand alone. It would then appear that when selling real estate the most important document in the transaction is the earnest money receipt or agreement. The terms of the transaction are fixed beyond any alterations when the agreement is signed by all parties.

HISTORY

The Oregon Statute of Frauds, set forth in ORS 93.020 and ORS 41.580, was enacted in 1862 as a part of the Civil Code, and in the opinion of many attorneys is our most important statute in the sense that it probably affects a greater number of business transactions than any other existing law.

ORS 41.580

"In the following cases the agreement is void unless the same or some note or memorandum thereof, expressing the consideration, be in writing and subscribed by the party to be charged, or by his lawfully authorized agent; evidence therefor, of the agreement shall not be received other than the writing, or secondary evidence of its contents, in the cases prescribed by law:

"(5) An agreement for the leasing for a longer period than one year, or for the sale of real property, or of any interest therein.

"(6) An agreement concerning real property made by an agent of the party sought to be charged unless the authority of the agent be in writing.

"(7) An agreement entered into subsequent to the taking effect of this Act, authorizing or employing an agent or broker to sell or purchase real estate for compensation or commission; provided, however, that if the note or memorandum of such agreement be in writing and subscribed by the party to be charged, or by his lawfully authorized agent, and contains a description of the property sufficient for identification, and authorizes or employs the agent or broker named therein to sell such property, and expresses with reasonable certainty the amount of the commission or compensation to be paid such agent or broker, such agreement of authorization or

employment shall not be void for failure to state a consideration."

ORS 93.020

"No estate or interest in real property, other than a lease for a term not exceeding one year, nor any trust or power concerning such property, can be created, transferred, or declared otherwise than by operation of law, or by a conveyance or other instrument in writing, subscribed by the party creating, transferring, or declaring the same, or by his lawful agent, under written authority, and executed with such formalities as are required by law."

The Supreme Court has denied Oregon brokers any right of recovery of a commission where they have been employed orally to sell real property. After expressing sympathy with their efforts, the court stated, "without a lawful agreement to support the same, no labor, however valuable, by one for another will make the person performing it more than a mere volunteer not legally entitled to compensation."

THE RULE FOR PERSONAL PROPERTY

In order to maintain an action for commission for the sale of real property it is necessary to have a written agreement; this rule or principle of law does not apply to actions for commissions claimed for the sale of personal property.

Oral agreements may be relied upon in the recovery of a commission for the sale of personal property. In numerous instances sales are made which include both real and personal property. If any real property is included in the sale and if the sale cannot be severed as between the real and the personal property insofar as a consideration is concerned, a broker cannot recover a commission for such sale without having an agreement in writing. This is true even though the real property may in fact constitute only a minor part of the consideration in the sale.

Uniform Vendor and Purchaser Risk Act

Any contract made on or after August 3, 1955, in this state for the purchase and sale of realty shall be interpreted as including an agreement that the parties shall have the following rights and duties, unless the contract expressly provides otherwise:

If, when neither the legal title nor possession of the subject matter of the contract has been transferred, all or a material part thereof is destroyed without fault of the purchaser, or is taken by eminent domain, the vendor cannot enforce the contract,

and the purchaser is entitled to recover any portion of the price that he has paid.

If, when either the legal title or the possession of the subject matter of the contract has been transferred, all or any part thereof is destroyed without fault of the vendor, or is taken by eminent domain, the purchaser is not thereby relieved from a duty to pay the price, nor is he to recover any portion thereof that he has paid.

The purpose of the Act is supplying of an answer as to who takes the loss if, after a contract is made for the purchase and sale of real property, a fire or other disaster destroys or seriously damages the property.

Minors

Modern day teenagers will hardly approve, but in law the reference to a person as an "infant" means any person who has not attained the age of majority as prescribed by law. The age of majority is defined as "the age at which, by law, a person is entitled to the management of his own affairs and to the enjoyment of civic rights."

At common law the age of majority was twenty-one, but under statutory law the age of majority is a matter for legislative regulation.

The age of majority as designated by Oregon statute, for both sexes, is twenty-one. But if a minor is legally married, such minor "shall be deemed to have arrived at the age of majority according to law".

The age at which a male and female may consent to marriage differs - eighteen years of age for the male and fifteen years of age for the female, with parental consent. The age at which a marriage may be contracted without parental consent is twenty-one for a male and eighteen for a female.

Care should be exercised when dealing with persons who may not have attained their majority. A contract, except for necessities, is voidable by the infant within a reasonable time after he attains his majority.

Q. 13 Name three of the five essential elements of a valid contract.

DEEDS AND CONVEYANCES

Rights in real property are subject to sale, either voluntary or involuntary, and are also subject to being devised by will, or to descent by operation of law. Voluntary transfer of title during the lifetime of the owner is always accomplished by a written document known as a "deed".

Just when the use of a written document was first used to transfer title is unknown. In the study of English law we are taught that early transfer of title was accomplished by possession, and proof of transfer of title existed solely in the memory of the witnesses present when a change of possession occurred.

STICK CARRIED TITLE

The actual delivery of title was through a symbolic ceremony known as "livery of seisin". The parties with their witnesses went upon the land and the grantor gave to the grantee a stick, twig, piece of turf, or a handful of earth taken from the land.

Sometimes other items, such as a ring or a knife, were handed over as a token of delivery of title. At the same time the grantor used proper and technical words which were to show that he intended to transfer the land. By the use of such words the extent of the interest conveyed was also expressed.

The use of the written instrument gradually became more pronounced; however, such use remained optional until the passage in England in the year 1677 of the Statute of Frauds. The principles of this statute were adopted by the State of Oregon. In addition, we also have a statute which reads as follows:

"Conveyances of lands, or of any estate or interest therein, may be made by deed, signed by the person of lawful age from whom the estate or interest is intended to pass, or by his lawful agent or attorney, and acknowledged or proved, and recorded without any other act or ceremony."

CONTROLLED BY LAW

After a person becomes the owner of land he cannot transfer or part with title except by some form or manner prescribed by law. The law in Oregon is:

"No estate or interest in real property, other than a lease for a term not exceeding one year, nor any trust or power concerning such property, can be created, transferred or declared otherwise than by operation of law or by a conveyance or other instrument in writing, subscribed by the party creating, transferring or declaring it, or by his lawful agent under written authority, and executed with such formalities as are required by law."

WORDS SIGNIFICANT

At common law, words used in a deed were significant in that each word was capable of creating a different estate. Under present usage deeds still retain some of the early language, and also designate the estate or interest conveyed. In some states there are statutes setting forth certain short convenient forms of deeds and declaring the effect to be given to the clauses or provisions thereof.

These deeds are called "statutory deeds". Deeds used in Oregon are based upon the common law conveyances. Oregon, of course, does have statutory provisions relating to form and legal effects of conveyances, but has no statutory deeds.

ADVERSE POSSESSION

Oregon law provides that "No grant or conveyance of lands or interest therein is void for the reason that at the time of its execution the lands were in the actual possession of another claiming adversely."

NO IMPLIED COVENANTS

The law also provides, "No covenants shall be implied in any conveyance of real estate, whether it contains special covenants or not."

DEEDS

Three types of deeds are used in Oregon. These are the Warranty Deed, Bargain and Sale Deed, and the Quitclaim Deed. The Warranty Deed has two forms: General Warranty Deed and Special Warranty Deed.

Most textbooks on the subject say that a deed to be valid must contain the following: Competent grantor, a grantee, recital of consideration, words of conveyance, description of land, quantity of estate conveyed, exceptions or reservations, warranties of title, execution, delivery and acceptance.

8053

QUITCLAIM DEED

Oregon law says of the quitclaim deed: "A deed of quitclaim or release, of the form in common use, is sufficient to pass all the estate which the grantor could lawfully convey by a deed of bargain and sale."

The quitclaim deed does not "convey", nor does it purport to transfer the property - only the "right, title and interest, if any" in the property.

This deed is usually used as a release. It contains no covenants of warranty or otherwise. Because it conveys only the present interest, if any, it does not have the protection of the recording acts as against a prior unrecorded conveyance.

It cannot safely be used for passing title, but is used to release a cloud on a title, or surrender or release an interest back to the holder of the fee title.

Title insurance companies will not insure on a quitclaim deed. It is their position that the sufficiency of a deed, whether it be a bargain and sale deed or a warranty deed, always depends on whether or not the grantee is a bona fide purchaser. If the grantee has acquired title in good faith without deceit or fraud, either of the latter deeds will convey a good and sufficient title. Such deeds are accepted by an examiner of titles at face values as passing all of the title of the grantor, including any after acquired title of such grantor.

Unfortunately, this cannot be said of the quitclaim deed, which is too frequently used in an attempt to convey title to real estate.

The quitclaim deed is best used to clear a cloud on the title and in correcting title defects in marital situations.

BARGAIN AND SALE DEED

A deed frequently used in Oregon is the Bargain and Sale Deed.

This deed can be identified by its basic words, which are "bargain and sell". Modern usage has generally expanded the granting clause to read "grant, bargain, sell and convey". A deed which contains these words and no other covenants will convey a good and valid title and will also convey after acquired title of the grantor. This deed is next to the lowest form in order of obligation by the grantor and protection to the grantee.

WARRANTY DEED

The deed most frequently used to convey title to real property in Oregon is the Warranty Deed.

Basically the Warranty Deed is a Bargain and Sale Deed with covenants. Such covenants are an agreement by the grantor that something is either done or shall be done or stipulates for the truth of certain facts. The granting words in a warranty deed are identical with those in a bargain and sale deed, to-wit: "grant, bargain, sell and convey". In addition a warranty deed usually reads as follows: "the grantor - covenants to and with the grantee - that he is lawfully seized in fee simple - that the premises are free from all encumbrances - and that he shall warrant and forever defend the granted premises - against the lawful claims and demands of all persons whomsoever."

These words contain the covenant of seizin and the right to convey. Such covenant is that assurance of the grantor that he has the estate in quantity and quality that he purports to convey. He covenants that the premises are free from encumbrances, unless, of course, he expressly excepts specific liens. He also agrees that in the event his promises and assurances are not correct he will defend the title against "the lawful claims and demands of all persons whomsoever."

SPECIAL DEED DESCRIBED

Deeds which contain the aforementioned general warranties are called General Warranty Deeds. There is also a Special Warranty Deed in use which has all the attributes of a bargain and sale deed, contains the covenant of warranty, but limits the warranty to only those acts or deeds committed by the grantor. The special warranty deed can be recognized by the following language, to-wit: "shall warrant and defend against the lawful claims and demands of all persons claiming by, through or under the grantor."

GRANTEE PROTECTED

Before the use of title insurance, deeds which contained covenants of warranty were considered extremely important because, in the event of a defect in title the grantee ostensibly had someone to look to for reimbursement when there was a failure of title. Such reimbursements depended, of course, upon the availability of the grantor and also his ability to pay or defend. A warranty is a personal obligation and if the grantor is deceased or has removed himself beyond the jurisdiction of the courts, or if his financial fortunes have changed, then the possibility of

recovery by the grantee because of a breach by the grantor would be doubtful.

Fortunately, our modern method of insuring titles has alleviated to a certain extent the absolute necessity of insisting upon a warranty deed.

TEXT IMPORTANT

Today it is the custom to use printed documents which emblazon the type or form of deed. Such deeds should not be accepted at their face value without closer examination of the entire document. Courts today do not rely upon the granting words alone to determine the type of deed, but examine and consider the entire document. A change in the granting words may change completely the form of deed and by so doing the right and liabilities of the parties thereto.

Each of the three forms of deeds is designed for a different use for special objects and in particular situations.

SOME USES

The warranty deed is the highest form of instrument in terms of protection to the grantee.

The special warranty deed is most frequently used in a "contract of sale" or "land contract" transaction, because its only warranty of title is to encumbrances suffered by or placed upon the title by the grantor, and does not warrant against liens or encumbrances placed on the property by the grantee, or others, in the interim.

If title insurance is not to be furnished, a seller limits his obligations to a minimum through use of the bargain and sale deed.

GENERAL RULES

A transfer of real property to husband and wife usually creates a tenancy by the entirety, but there are cases where for tax purposes, or something else, a tenancy in common is indicated. The short form deed now used by many Oregon attorneys should result in greater working cooperation between the real estate practitioner and the lawyer.

Frequently in a discussion of conveyances we use the word "executed", which simply means that these instruments of real property transfer must be signed by the grantors. A deed without a date is

still valid, but a deed without a grantor's signature is a headache.

The signature of the grantors should be acknowledged before a notary public, but under Oregon law, if it is necessary, the acknowledgment can be accomplished by the signing of a subscribing witness.

The word "delivery" is universally understood to be the physical act of handing over, and the time is understood to be when something actually passes between the parties. Oregon decisions, however, define delivery of a property interest as the time the grantor manifests an intention to transfer his interest. Actual delivery to the grantee or delivery to an escrow agent is the normal procedure.

CONSIDERATION SHOWN ON
CONVEYING INSTRUMENT

All instruments conveying an interest in real estate must show on the face of the instrument the true and actual consideration paid, stated in terms of dollars.

"Consideration" includes the amount of cash and any lien, mortgage, contract, or other encumbrance existing against the property and agreed to be paid or assumed by the purchaser. The monetary value of personal property included in the sale need not be stated, but it must be shown as a part of the consideration.

The grantor has the prime responsibility for making the recital. If he is unable to act, the grantee takes responsibility. No conveyance will be accepted for recording unless it contains such a verifying statement.

The giving of a false statement is punishable by a fine up to $500.

Recordation and Its Effects

The recording system of Oregon, modeled after the system established by the original American Colonies, is strictly an American device for safeguarding the ownership of land.

Under the recording statutes, the first person who records his mortgage has the first lien. Without such a system, there would be an open door to fraud.

The recordation statutes provide a system by which evidence

of title or interest therein can be collected in a convenient and safe public place, to the end that those planning to purchase or otherwise deal with land may be more fully informed as to the ownership and condition of the title.

When an instrument is recorded, under Oregon statutes notice is given to the world of its existence. Real estate practitioners have an obligation to give the grantee in a conveyance the protection of the recording statute at once.

Under the growing popularity of the escrow method of closing, title insurance companies accept all the necessary documents to a transaction, check title records, examine the instrument, and see to the recording.

Normal procedure in Oregon is for the seller to pay the cost of title insurance and recording of any documents to clear title. The buyer pays the recording fee for his deed, and, of course, the fee for any mortgage he himself puts on the property.

The recordation statutes require the county clerk to provide separate books for the recording of deeds and mortgages; to certify the time of receipt of every conveyance; to keep an index; to accept recordings of leasehold interests; to record foreclosed mortgages; to accept notice of lis pendens; and to issue a subpoena to compel a witness to testify to execution of a deed.

Two sections of the Oregon recordation act are of importance to real estate practitioners. They are:

ORS 93.640. (1) Every conveyance affecting the title of real property within this state which is not recorded as provided by law is void as against any subsequent purchaser of the same real property, or any portion thereof, in good faith and for a valuable consideration whose conveyance is first filed for record, and as against the heirs and assigns of such purchaser.

(2) Every assignment of sheriff's certificate of sale of real property on execution or mortgage foreclosure which is not recorded in the records of deeds in the county where the land is situated within five days after its execution is void as against any subsequent purchaser of such certificate of sale, or the real property covered thereby, or any portion thereof, in good faith and for a valuable consideration whose assignment is first recorded.

ORS 93.650. The record of a conveyance duly recorded, or a transcript thereof certified by the county clerk in whose office it is recorded may be read in evidence in any court in the state, with the like effect as the original conveyance. However, the

effect of such evidence may be rebutted by other competent testimony.

ACKNOWLEDGMENT

In order to be protected under the recording act, a purchaser of title to real property must have a properly executed and acknowledged instrument which is entitled to be recorded.

The acknowledgment, usually before a notary public, does not validate the deed but the grantee cannot avail himself of the protection of the recording act unless this formality is followed.

If a grantee is in possession of a deed which has not been acknowledged, Oregon statute makes it possible to record by having the signature of a witness to the document acknowledged. If there are no witnesses it is still possible to prove the handwriting of the grantor in circuit court.

Q. 14 The title interest of the grantor passes to the grantee when a valid deed is:

(A) signed
(B) recorded
(C) delivered and accepted
(D) acknowledged

Q. 15 What is a "bargain and sale deed"?

Q. 16 Which of the following is a requirement in order for a deed to be valid and convey title?

(A) an acknowledgment
(B) execution on a day of the week other than Sunday
(C) a property description
(D) use of the phrase "to have and to hold"

OPERATING THE REAL ESTATE OFFICE

The Law of Agency in a publication dealing with a discussion of law would normally be found in the section on contracts, but in a Manual for real estate practitioners it is properly placed under operation of the real estate office.

"Agency" is defined as the relationship which exists when one person is employed to act for another.

There are three kinds of such contractural relationship: Principal and agent, master and servant, and employer and independent contractor.

Assuming that "principal", "master" and "employer" have generally similar rights and obligations, what of the second parties in each contractural relationship?

An "agent" is employed by his principal to bring the principal into new contractual obligations.

A "servant" represents his master in the performance of ministerial or mechanical acts or services.

As an "independent contractor" the employer has no control over the means or methods by which the work is accomplished.

The relationship between a real estate broker and the owner of property is that of principal and agent. Under certain circumstances in a real estate transaction the position of principal and agent exists between the broker and the buyer.

The real estate broker is a special agent—he has been employed to sell a particular parcel of land. He cannot delegate his authority. In other words, he cannot transfer the legal rights the principal has against him.

RIGHTS OF PRINCIPAL AGAINST AGENT

1. Right to have the agent render reasonable diligent and skillful services. (This is why we have educational programs.)
2. Right to have the agent act in obedience to instructions, and only within the limits of his authority.
3. Right to demand an accounting from the broker in financial dealings of the agent with third persons. (One of the principal reasons for a Closing Statement)
4. Right to expect fidelity and loyalty from the agent. The agent must inform the principal of such facts that come to his knowledge as would be likely to influence the principal's action. (A reason for giving a frank opinion of Market Value) The agent cannot take advantage of information to make a personal profit. (Purchase of the property by the broker without a full disclosure) The agent cannot accept side compensation. He cannot act for both parties. (Both must agree with full knowledge of the facts.)

RIGHTS OF AGENT AGAINST PRINCIPAL

1. Right to compensation agreed upon.
2. Right to reimbursement and indemnity. The principal is bound to pay all bills incurred, as long as the agent is acting rightfully and within his authority.

An agent warrants his authority and subjects himself to suit for damages for breach of his warranty. An agent is not a "partner." Partnership is defined as an association of two or more persons to carry on, as *co-owners,* a business for profit.

The relationship between the real estate broker and the real estate salesman has usually been considered as that of independent contractor, but some tax rules make it that of employer and employee.

A strict interpretation of the Real Estate Law would fix the relationship as employer and employee. The State Tax Commission so holds, requiring the broker to withhold state income taxes from the gross commission of the salesman. The State Compensation Department takes the same position.

The Federal government, on the other hand, accepts the statement of the broker that the arrangement is that of employer and independent contractor. It should be pointed out, however, that this relationship contemplates that the broker has no control of the means or methods used by the salesman in getting the work done.

It cannot be stressed to heavily that the broker is a trusted fiduciary agent of the seller.

The authority and trust placed in a real estate broker is closely akin to that of a lawyer and his client, a physician to his patient, or an accountant to his principal.

We owe the maximum in loyalty, honesty, trustworthiness, and our best efforts. When it is remembered that relations with the buyer are of immense concern to future reputation, it will be apparent that the stability of our progress will be measured by the degree to which we practice the Code of Ethics.

TERMINATION OF AGENCY

Ordinarily, the agency may be terminated by acts of the parties or by operation of law. The parties may agree to terminate it, or the agent may renounce the agency, or the principal may revoke it. An agency is also terminated by the expiration of its term, extinction of its subject, or the death or incapacity of either the principal or the agent.

Broker Owes Fidelity to Principal

Real estate brokers and the salesmen for whom they are responsible should frequently remind themselves of the duty which they owe to their principals of exercising the highest degree of fidelity toward them, and of making a full and complete disclosure of any and all natural facts involved in a transaction.

This principle may be well illustrated by reference to the case of Hanson et al vs. Johnson et ux, 143 Ore. 536. In this case the Plaintiffs, who were real estate brokers, brought an action against the Defendants upon a promissory note of $200.00. This promissory note had been given by the Defendants to the Plaintiffs in payment for the balance due upon a commission arising out of an exchange of property.

The Defendants filed a counter-claim asking for damages against the Plaintiffs based upon alleged fraud. The Defendants, upon the trial, obtained a judgment against the Plaintiffs for $1,500.00 and the Plaintiffs appealed the case to the Supreme Court. The evidence in the case disclosed that the Defendants had been residents of the State of California. They had been in communication with the Plaintiffs with the view of trading a parcel of property which they owned in California for a ranch in Oregon. After some correspondence between the Plaintiffs and the Defendants, the Defendants came to Oregon and called upon the Plaintiffs and made two visits to the Oregon ranch. Ultimately an exchange agreement was signed between the Defendants and the owners of the Oregon ranch, as a result of which the Defendants received the Oregon ranch.

The fraud alleged by the Defendants in their counter-claim had to do with the condition of the soil of the ranch which they obtained and some other details with respect to the ranch. The Plaintiffs contended, upon the appeal in the Supreme Court, that since the Defendants had visited the ranch on two different occasions, they had no right to rely upon anything which the Plaintiffs may have said with regard to the ranch. The Supreme Court, in passing upon this question, called attention to the fact that the Plaintiffs in the transaction were acting as agents for the Defendants as well as agents for the former owners of the Oregon ranch. The Supreme Court in its opinion, in pointing out the duty of the real estate broker to his principal, made the following pertinent statement:

"The Plaintiffs were Johnsons' agents, and it was their duty to make full and truthful disclosure of all material facts known to them. They could not lawfully misrepresent nor conceal."

If You Keep Good Records, Your Records Will Keep You

The Oregon real estate law requires that you keep copies of certain documents pertaining to a real estate transaction. These must be kept for six years.

Taxing authorities require the keeping of other records, and in our highly regulated society it is prudent to think twice before throwing anything away.

Complete records are often an unexpected protection for the broker. Copies of every letter, contract or agreement leaving the office should be properly filed.

The modern real estate office should have a property record file, set up by street names and street numbers. The value of this file showing property transfers, will increase with the years and become your own "valuation laboratory."

There should be a general file for correspondence, and a file for listings. The originals from both files should never leave the office.

A valuable aid in any office is what might be called a "people file." This is a record of everything you learn about individuals in your community and can be a real source of prospects.

In addition to the records required by law, every office should keep adequate and complete office operation records. There is nothing that will educate you faster than seeing where money was spent needlessly. Learn to question every expenditure and ask yourself if it was really necessary.

The really efficient office will require a signed contract between broker and salesman, which in its truest sense will be a procedure manual. Under such an arrangement all parties are fully aware of their rights and obligations toward each other.

A salesman is entitled to know office policy toward "walk-ins" and floor duty. He has a right to expect some system of advising him that "so-and-so" helped a certain individual while he was out of the office.

Salesmen will help in the important task of keeping an office neat and orderly if ground rules are spelled out. The simple little thing of keeping a telephone tied up with personal calls should be spelled out in a taboo list.

With so much discussion in the nation as to the danger or non-danger of smoking it is difficult to recommend on a "smoking rule", but a real safe bet would be a ban on smoking in the customer area by *all* personnel of the office.

Visits by Real Estate Division Examiners

Periodically every licensed broker is visited by a field examiner from the Oregon Real Estate Division. He has been assigned by the Real Estate Commissioner to make a routine office inspection. He is a civil service employee of the State of Oregon, who has passed a general fitness examination and been thoroughly trained on the job he is authorized to perform.

To the real estate broker interested in conducting his business in accordance with the real estate law and accepted business ethics, this visit can be very beneficial.

The broker and his sales people should feel free to ask any questions they desire of the field man, and free to discuss departmental business.

His authority and training is limited to the real estate law and the rules and regulations of the Real Estate Board. He should not be expected, and certainly will not, attempt to give advice on real estate problems outside his authority and training.

The field examiner will expect to examine all pending real estate transactions. He will determine amounts of earnest money received and disbursed, as well as the respective dates of such receipt or disbursement.

In the event of disbursement prior to closing, he will want to examine the authority for such disbursement. He will further, examine transactions closed since his last visit to determine that all documents are in proper order, and to match the closing statement items to the clients' trust account cancelled checks.

He will satisfy himself that pro-rates are prop and paid, and that title costs are also correct and paid. He will check to see that the broker's sign is placed as the law requires, and see that it corresponds with the license issued by the Commissioner.

You may expect him to examine salesman's business cards to satisfy himself that they comply with

the legal requirements, that such advertising must feature and identify the real estate firm rather than an individual salesman. He will contact the bank where the clients' trust account is located to determine the balance on hand, and audit the broker's account to see that the balance equals the liability.

Any violations noted will be called to the attention of the broker, be charged against the broker, and fully explained by the field examiner in his report to the Commissioner. Subsequent office inspections should show elimination of these violations of the real estate law or rule and regulation of the Board.

The field examiner has been carefully selected by the supervisory personnel in the Oregon Real Estate Division. He should be a welcome friend to all licensees, however, as the representative of the Commissioner, who is charged with the administration of the law and the rules and regulations, he will not tolerate any attempt to hide or evade information he believes relevant.

He has been trained to find errors accidental or otherwise, and is conversant with the law sufficiently to use it as the implement with which to do a good job for every licensee and the Commissioner.

Ignorance of the requirements of the real estate law and the rules and regulations of the Oregon Real Estate Board relative to the keeping of certain records is no excuse for the absence of such records.

Lack of complete records will be considered a serious violation by the field examiner, and one that certainly will prompt a more complete investigation by the Commissioner.

ORS 696.280 provides that records of all real estate transactions handled by or through the broker shall be kept. These include listings, earnest money receipts and closing statements showing all receipts, disbursements and adjustments.

The "Shall Nots"

The limited number of disciplinary actions taken by the Real Estate Commissioner each year is ample proof of the recognition of each licensee of the weight of the confidence and trust that accompanies the issuance of a real estate license.

Sufficient cause for the suspension or revocation of a license would be proof of any of the following:

1. Making any substantial misrepresentations.
2. Making false promises.
3. Unauthorized use of the word "Realtor."
4. Representing both parties to a transaction without the knowledge of both.
5. If a salesman, accepting compensation from one not his employer.
6. If a salesman, representing another broker without his employer's consent.
7. Failing to account for another's money or other property within a reasonable time.
8. Issuing an appraisal report on real property in which he has an interest unless the nature and extent of such interest is fully disclosed in the report.
9. Violating any provision of the brokers and salesmen law.
10. Publishing untruthful or misleading advertising.
11. Paying or receiving any rebate, profit or compensation in violation of the law.
12. Inducing, for personal gain, a party to breach a contract for the purpose of substituting a new contract in lieu thereof.
13. Conviction of forgery, embezzlement, obtaining money under false pretenses, larceny, extortion, conspiracy to defraud, moral turpitude, or any like offense.
14. Demonstrated want of integrity.
15. Guarantee of future profits on resale.
16. Placing "for sale" or "for rent" signs on property without the owner's consent.
17. Using "free lot" schemes, lotteries, contests or prizes to induce sales.
18. Any act which demonstrates bad faith, incompetency, untrustworthiness.
19. Failing to pay the registration or annual renewal fee within the time specified in the law.
20. Commingling of money or other property of his principal or client with his own.
21. Failing or refusing upon demand to produce any document, book or record in his possession concerning any real estate business transacted by him for inspection of the real estate Commissioner or his authorized representative.
22. Failing to maintain at all times in his principal place of business a complete record of every transaction which comes within the provisions of the law.
23. Violation of the law administered by the Labor Commissioner respecting discrimination on account of race, color, religion, or national origin.

Some Pertinent Questions

Q. Where a license is issued to a partnership or a corporation, is the person designated to act on behalf of the group authorized by the license to conduct a real estate business in his own name?

A. No. If he desires to conduct a real estate business in his own name, he must make a separate application for a license as an individual, pay a separate fee, and secure a separate license.

Q. May a partnership or a corporation be represented by members or officers other than the one designated in its application?

A. Yes. Should other members, *other than the one designated in the application,* desire to act on behalf of the group each such member is required to take out a separate broker's license and pay the required fees. Such a licensee is not authorized to transact real estate business in his own name.

Q. Can a salesman be a member of a partnership or an officer of a corporation?

A. No. The law provides that every member of a partnership or officer of a corporation who will perform any of the acts constituting the practice of real estate shall be licensed as a broker.

Q. If an application for license is made during the last half or the last quarter of the year, is the

applicant permitted to pay one-half or one-quarter of the annual license fee?

A. No. Irrespective of the date of the application, the full amount of the annual fee must be paid.

Q. How does a broker change the name under which he will operate?

A. Get from the division a form known as "Request for Real Estate Broker's Change of Name"; complete the form and return to the division with his license and pocket card, the licenses and pocket cards of his salesmen; and fees of $5.00 for himself and $1.00 for each salesman.

Q. How is a change made of location of a branch office?

A. Obtain from the division the form "Request for Real Estate Broker's Branch Office"; complete and return to the division with the fee of $5.00. A branch office license is not transferable.

Q. What are the requirements of the employer broker upon the termination of the salesman's employment?

A. The employer-broker shall immediately return the salesman's license to the division for cancellation. The broker shall, at the time of returning the salesman's license notify the salesman at his last known address of the return of his license to the Commissioner. A copy of such communication to the salesman shall accompany the license when mailed or delivered to the Commissioner.

Q. What is the effect of a salesman's failure to notify the Commissioner of a change of employer?

A. Failure to notify the Commissioner within ten days automatically cancels the salesman's license.

Q. How are salesmen affected by a revocation or suspension of the license of their employer broker?

A. Their licenses are immediately and automatically suspended pending a change of employer and a transfer of license. Should any of the salesmen enter the employ of another broker during the same year, a new license will be issued to the salesman without charge upon the surrender of his former license and pocket card.

Q. What is the effect upon the license of a partnership, or a corporation, of a revocation or suspension of the license issued to the member authorized to act on behalf of the partnership or corporation?

A. The license of the partnership or corporation shall be revoked unless, within a time to be fixed by the Commissioner, the offending member is discharged.

Q. Must a broker remove his sign when he moves his office?

A. Yes.

Q. May a real estate broker who is not a Realtor advertise or hold himself out as such?

A. No. The word is in effect a coined term and may only be used under certain conditions. Its unauthorized use may be enjoined by the courts and such a use is ground for revocation of a license.

Q. In case a real estate broker desires to change his place of business, what must he do?

A. He must notify the Commissioner on a form supplied by the division "Request for Real Estate Broker's License Transfer"; send in his license and pocket card and the licenses and pocket cards of all salesmen in his employ; and remit $5.00 for the reissuance of his license and $1 fee for reissuance of each salesman's license.

Q. In case a real estate salesman desires to change his employer, what must be done?

A. He should obtain from the division a form known as "Real Estate Salesman's License Transfer"; request the broker by whom he is employed to send to the Commissioner his license (the broker shall do so without delay) and obtain the signature of the broker on the transfer form; go to the broker whose employment he will enter and obtain his signature; mail the completed Real Estate Salesman's License Transfer, his pocket card and the $5.00 fee for transfer of license to the division.

Q. What are the legal requirements for branch offices?

A. Every additional office or place of business other than the principal place of business of a broker shall be licensed only with the approval of the real estate Commissioner after the broker has given satisfactory proof that this additional place of business will be so located as to receive the broker's personal supervision, or that it will be under the supervision of a duly licensed competent employee of the broker, approved by the Commissioner. Every such office shall be designated a BRANCH OFFICE by an appropriate sign displayed in the manner provided by the law.

Q. Does the law provide the qualification of a manager of a branch office?

A. Yes. Each branch office shall be in charge of an associate broker or a licensed salesman with at least two years experience as a salesman.

Q. Is a real estate broker required to post or erect a sign at his place of business?

A. Yes. Each place of business must be designated by a sign containing the name under which the broker is licensed, together with the words "Real Estate", or if a member of the National Association of Real Estate Boards, the word "Realtor." Each sign shall be written in letters not less than one inch in height and placed so that it can be easily observed and read by anyone entering the place of business.

Q. When a license expires at the end of the license year and an application to renew, together with the fee, is not made until ten days later, is the licensee permitted by law to engage in the real estate business during that ten day period?

A. No. The license is automatically suspended until the fee is paid. In such an instance the licensee was unlawfully engaged in real estate, and could be required to take another examination.

Q. Is it necessary for a real estate broker, associate broker or salesman to have his license on his person at all times?

A. No. All licenses are in the custody and control

of the broker and must be displayed at his principal place of business.

Q. Is the licensee furnished with any evidence showing his authority to transact business as a broker or salesman?

A. Yes. Pocket cards are furnished by the Commissioner for that purpose.

Q. How many places of business may a real estate broker maintain?

A. At least one is required. He may maintain as many branch offices as he desires so long as they comply with the law. Each place of business must be registered with the Real Estate Division and an annual fee of $5.00 is paid to cover each branch office licensed.

Q. Is the broker notified when a salesman in his employ makes application for a broker's license?

A. Yes. The applicant is obliged to have the broker complete the form "Verification of Salesman Experience Claim by Employer Broker."

Q. How may a real estate broker act as a salesman for another broker if he obtains an associate broker's license?

A. An associate broker's license may be obtained by a broker, without examination. He then executes the form "Associate Real Estate Broker Agreement" obtainable from the division. This is an agreement that he will not act as a broker other than as an employee of his employing broker. A copy of the agreement is filed with the Commissioner.

Q. What is the proper procedure to obtain an associate broker's license.

A. Complete form "Application for Associate Broker's License", obtainable from the division, return with present license and pocket card, and the fee of $5.00. The broker's license can be reinstated by the cancellation of the associate license.

Q. In what form will an associate broker's license and pocket card be issued?

A. Similar to those of a salesman, except that the words "associate broker" will replace "Real Estate Salesman."

Q. If a salesman's license has been surrendered as inactive, what is the cost of reactivating it during the current fiscal year?

A. The license will become inactive 10 calendar days after receipt in the Division if a transfer to another broker is not effected within that period. Reactivation of the license during the current fiscal year will require payment of the full license fee of $15. If the license is transferred during the 10-day period, the transfer fee of $5 applies.

Q. Does the same procedure apply to an associate broker?

A. Yes. Reissuance of the license after the 10-day period, either as an associate or a broker, will require the full fee of $25.

Q. Can a broker take advantage of a 10-day waiting period?

A. No. The license of a broker becomes inactive upon its surrender to the division for purposes other than a status change. In effect, a broker placing his license "on ice" one day may conceivably, a day or so later, decide to resume business. He would then be required to pay the full reactivation fee of $25.

Q. The Manual says a broker "cannot delegate his authority". Does he not do this when he appoints a branch office manager?

A. Under the law of agency a broker cannot transfer the legal rights his principal has against him. In appointing a branch office manager he is merely delegating limited responsibilities to the manager. It should also be kept in mind that this delegation does not mean abdication by the broker. A California court decision stated "a salesman is strictly an employee of the broker. He should not collect money from customers or actively take charge of the broker's office".

The Ninety-Day Clause

Most listing agreement forms in use in Oregon contain a clause which provides that the seller will pay the broker a commission if the broker places the owner in touch with a prospective buyer, who purchases the property within a limited period after expiration of the listing.

The period after expiration of the listing is 90 days in most areas of the state, and 60 days in the form used by the Portland Board of Realtors.

A few brokers are critical of this clause because its existence creates a possibility of the owner being liable to two different brokers for full commissions, upon the same transaction. Most brokers are in favor of this clause being in the listing agreements because of the fact that without it the owner and prospective purchaser can get together and agree to wait until the listing expires before making a deal and thus likely defeat the broker's right to recover his commission.

While it is true that this clause performs a useful service in protecting a broker and his efforts against a deliberate waiting out of a listing period by unscrupulous parties, it has frequently been used in a manner not originally intended.

The Commissioner and other members of the Real Estate Board have spoken very strongly against any use of the clause which would place an owner in danger of being liable for two commissions for a single sale.

In this connection every broker should be familiar with Rule 10-015, which reads as follows:

"10-015 Listings. (1) A broker or salesman who obtains a listing shall, at the time of securing such listing, give the person or persons signing such listing a true, legible carbon copy thereof.

"(2) Every listing agreement, exclusive or non-exclusive, shall state a definite expiration date; it shall contain no provision requiring a party signing the listing to notify the broker of his intention to cancel the listing after such definite expiration date; it shall contain no provision which would subject the owner of the property to the payment of two commissions for one sale in the event the owner lists the same property with a second or subsequent broker after the termination of the first or preceding listing.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

"(3) No broker or salesman shall conspire with anyone to deprive an original listing broker of a commission, utilizing the restrictions of sub-paragraph (2) above."

There is a question in the minds of some brokers as to whether or not a broker can recover a commission under this clause without proving that he was the procuring cause of the sale. This question was definitely answered a number of years ago by the Oregon Supreme Court in the case of McGuire vs. Sinnett. A salesman for the plaintiff took the prospective purchaser to the home of the defendant, at which time the salesman introduced the purchaser to the defendant. The salesman, the purchaser and the defendant then went to the house covered by the listing in order to show the house to the prospective purchaser. Upon arriving at the house they were unable to get inside of the house because it was occupied by a tenant and the tenant was not at home. The purchaser inspected the exterior of the house and the defendant promised to make arrangements with the tenant for admission to the house so that the purchaser would have an opportunity to thoroughly inspect it. These arrangements had not been made by the defendant and after a few days the purchaser read an advertisement of another broker which covered the same property. This broker took the purchaser to the property and was able to get into the house so that the purchaser had an opportunity to inspect the interior. About two weeks after the expiration of the original listing, the purchaser made an offer to purchase through this second broker and the deal was closed.

It was the contention of the defendant in the Supreme Court that the plaintiff was not entitled to recover since he was not the procuring cause of the sale because the plaintiff had not shown the purchaser through the property and had not obtained a deal and that the sale, in fact, was made by the second broker. It was the contention of the plaintiff that he was entitled to recover under this so-called ninety (90) day clause contained in the listing agreement even though he was not the procuring cause of the sale. The Supreme Court in upholding the contention of the plaintiff stated as follows, in its opinion:

"In the case before us, the broker is entitled to his commission in one of three following instances: (1) If he found a buyer ready and willing to enter into a contract with the defendant on terms and price agreed to by the defendant; (2) if he placed the defendant in touch with a buyer to whom the defendant sold the property during the life of the contract or within ninety days after the expiration thereof; or (3) if he was the procuring cause of the sale."

Therefore, there is no question but that if a broker is able to prove that he placed a purchaser in touch with the seller during the life of the listing and the purchaser consummated a deal prior to the expiration of ninety (90) days from the termination of the listing, the broker is entitled to a commission regardless of whether or not he was the procuring cause of the sale.

Q. When is a broker the procuring cause of a sale?

A. It frequently happens that an owner of real estate employs two or more brokers to effect a sale. Such employment is optional with the owner and, until he revokes the authority given, each broker has the right to find a purchaser. In such instances there is no implied contract to pay more than one commission, and the broker who first brings about a sale is the one who is to be compensated. When competing brokers approach the same prospect, who eventually buys the property, many nice questions arise as to which has earned the promised commission. In Scott vs. Lloyd, 19 Colo. 401, 35 Pac. 733, it is said that where property is openly put in the hands of more than one broker, each is aware that he is subject to the chance of competition and that if either finds a person who is likely to buy and quits him without having effected a sale, he must know that he runs the risk of such customer falling under the influence of his competitors and that in such case, if they effect a sale, his labor is lost. "This risk," said the court, "is an inevitable part of the business."

From a more recent court action in reference to the subject, we are quoting in part, from a decision of the Oregon Supreme Court, found in the case of Withers vs. Sohoweid, 198 Or 449 as follows:

"Not having found a buyer ready and willing to enter into a contract for the purchase price or such other price that the defendant was willing to accept and not having placed the defendant in touch with a buyer, the defendant sold the property, plaintiff was not entitled to have the case go to the jury and the court should have granted the defendant mentioned a direct verdict."

For brokers to become involved in such litigation further emphasizes the fallacy of not dealing entirely with exclusive listings.

Under the decisions in such cases, the law will award the commission to that one of the brokers who is the procuring cause of the sale. A broker is said to be the procuring cause of a sale when he originates or starts a series of events which without break in their continuity result in the accomplishment of an actual sale.

Cancellation of Non-Exclusive Listing

A serious problem arises where the owner of property has an out-standing non-exclusive listing and gives an exclusive listing to another broker.

Many brokers have the erroneous idea that the mere giving of the exclusive listing to another broker terminates or cancels the existing non-exclusive listing. This is not a fact. The mere giving of an exclusive listing to a second broker has no effect whatsoever upon the rights of the broker who has the non-exclusive listing. Therefore, an owner in this position must attempt to do what he can in order to protect himself. If the owner waits until the expiration date of the non-exclusive listing he can with safety then give to another broker an exclusive listing, except that even after the expiration of the non-exclusive listing there might potentially be some liability if a sale were made to a customer produced by the broker having the non-exclusive listing. The 90-day clause (60 days for the Portland Board of Realtors) gives the first broker certain legal claims under the contract even after its expiration.

The problem is also sometimes complicated by the fact that the non-exclusive listing does not contain a definite expiration date. In this event the listing is in force and effect a reasonable length of time. It is true that one of the rules and regulations of the Oregon Real Estate Board provides that a broker shall not take any listing except that it contain a definite expiration date. Although this rule and regulation may subject the broker to disciplinary procedures for its violation in the event the broker has a listing without an expiration date, this does not and cannot affect the legal rights which the broker has under the listing itself.

Where an owner wishes to give an exclusive listing to a new broker thought should be given to whether it is possible for the broker to cancel the non-exclusive listing. Unless the non-exclusive listing by its terms contains some provision with respect to its cancellation, an owner should proceed with caution in attempting to effect a cancellation. There are, in fact, some listings in use in Oregon that do contain a provision for cancellation.

It cannot be definitely said one way or the other under the law in this state whether or not the owner has the legal right to cancel a non-exclusive listing while it is still in force and effect. If thought is given to cancelling a non-exclusive listing while it is still in force and effect, care should be taken with respect to a sentence which appears in many of the listing agreements, which is to the effect that in the event the owner terminates the listing prior to its expiration date, that he agrees to pay a commission to the broker just as if a sale had been made; so if the non-exclusive listing in question contains this sentence, it is possible that an attempted cancellation of the listing by the owner might subject him to immediate liability under this clause of the listing agreement.

It would be well to mention the position in which an owner will find himself if he gives to another broker an exclusive listing while he has a non-exclusive listing outstanding. If the broker who has the non-exclusive listing finds a buyer ready, able, and willing to buy the property for the price and upon the terms of the listing, the owner becomes liable to that broker for the commission whether the owner sells the property to that buyer or not.

If the owner sells the property through the broker having the non-exclusive listing, or to his prospect, he will become liable to the broker having the non-exclusive listing for the full commission, and, of course, if the sale is consummated while the exclusive listing is still in force and effect, the owner will also be liable to the broker having the exclusive listing for the full amount of the commission.

In this discussion we have assumed that the action by which the owner gave both a non-exclusive and an exclusive listing was initiated by the owner. All ethical brokers frown on a situation where an owner is required to pay a full commission to two different brokers for the sale of one piece of property, and, as pointed out, this might very well happen in the situation being discussed here.

A real estate broker or real estate salesman has no right to inquire of owners concerning the expiration date and making other solicitation of existing listings. Such an action is considered unethical conduct under the national code of ethics.

In fairness to the owner, and in fairness to the above principles of ethical conduct, any broker taking an exclusive listing on property he learns to have already been obligated under a non-exclusive listing, should promptly amend his listing agreement to except the owner from liability as to prospective purchasers produced by the broker having the non-exclusive listing.

Situations of this kind, all too frequent for the welfare of the real estate vocation, could never arise if only exclusive listings are taken.

Questions They Ask

Q. What is the position of the real estate broker with reference to the attorneys of the buyers and seller?

A. In closing sales and leases, the broker should always recommend the employment of competent legal counsel; many misunderstandings arise out of the doubtless sincere but erroneous advice of those not skilled in the complexities of the law; "home-made" contracts frequently result in trouble and litigation, with a consequent loss to the broker of prestige and good will. The proper fees of the attorneys are paid by the buyer and the seller. When the broker fails to recommend legal counsel, he may be injuring not only himself, but those whose interests he is required to protect. A satisfied client is always potentially a "repeat customer" and an asset to any broker.

Q. Is it good policy for a broker to give a copy of the listing agreement to the owner who employs him?

A. The listing form is a contract and each party to the agreement is entitled to a copy. If the broker's employer is furnished with copies of all listings and other agreements, many future misunderstandings will be avoided. Rule 10-015 says the broker or salesman *shall* give the owner a true, legible carbon copy of the listing.

Q. May a real estate salesman be lawfully employed by or accept compensation from any broker other than the broker under whom he is licensed at the time?

A. No. Such employment is prohibited by ORS 696.290, which in its broadest sense would seem to make any other employment unlawful, referring directly to the so-called "part time" salesman.

Q. Where a real estate salesman employed by one broker is assisted in a transaction by a real estate salesman employed by another broker, under an arrangement whereby both salesmen are to have a part of the commission, is it lawful for the first to pay directly to the second salesman the latter's share of the commission?

A. No. Payment to the second salesman must be made through his employer broker.

Q. Assume that after a listing is taken, an earnest money receipt signed, or a contract executed, a slight change is made in the terms or conditions, and the broker, in the presence of the interested parties, alters the writing to conform to the new arrange-

ment; what precaution should the broker take to protect himself against future misunderstandings?

A. Always and without exception, he should have all parties to the contract place their signatures or initials in the margin opposite or nearest the alteration. A better practice is to have the document entirely rewritten.

Q. What may a licensed real estate broker lawfully do that licensed real estate salesman may not do lawfully?

A. Among other things, a salesman may not transact any phase of the real estate brokerage business in his own name, all must be transacted in the name of the broker by whom he is employed. These phases include: Opening and maintaining an office, employing salesmen, listing, advertising, soliciting, negotiating, taking deposits, issuing earnest money receipts, closing transaction, dividing commission, etc.

Q. Where a real estate broker who is employed to sell a particular property, buys it himself, but in the name of a "dummy", will the sale stand if attacked?

A. No. As agent for the seller, it is the broker's duty to get as much for the property as possible; as buyer, it is to the broker's interest to acquire the property as cheaply as possible; in such a situation there is a direct conflict between duty and self interest; therefore, it is well established that if a broker desires to purchase the property himself, he must, before so doing, advise the owner to the effect: if the owner then is willing to proceed, the sale is valid; if the broker does not make a full disclosure, the sale may be set aside. There is nothing inherently wrong in a broker buying his employer's property; the wrong lies in not advising the employer of the broker's true interest in the matter.

Q. A broker is employed by an owner to sell a particular property. He introduces a prospective purchaser to the owner, who, a short time later, cancels the contract of employment. Some time later the owner sells to this prospect. Is the broker entitled to his commission?

A. Yes, in all ordinary cases. The law of agency requires the owner to exercise towards the broker the same good faith as is required of the broker in his dealings with his employer.

Q. Is a real estate broker liable in law for frauds and misrepresentations of a salesman working out of his office, where the broker had no knowledge of the misrepresentations and did not participate in them?

A. Probably yes. If the fraud and misrepresentation were practiced in connection with real estate the broker had for sale.

Q. Is a real estate salesman liable to third persons for the misrepresentation of the broker with whom he is associated?

A. Not unless he participates therein.

Q. Why is it necessary that a contract employing a real estate broker to sell real estate for a commission be in writing?

A. The Statute of Frauds provides that unless such contracts, or some sufficient memo thereof, are in writing, signed by the employer, they are void.

Q. How is the Statute of Frauds usually interpreted by the courts.

A. Strictly against the broker. He has no standing in any court unless his contract of employment is in writing.

Q. What is the position of a broker, who accepts oral employment to sell real estate, and then finds a purchaser who buys the property and pays the owner his full asking price?

A. In view of the Statute of Frauds, the broker is helpless to recover compensation, wholly irrespective of the fact that the owner has derived a substantial benefit; the law regards the broker as a mere "volunteer" offering and giving his services gratuitously. See the next question for the proper procedure in a similar situation.

Q. Assume that a real estate broker is orally employed to sell real estate; he finds a purchaser to whom he gives a receipt for the earnest money; he then secures the owner's written approval of the sale and the latter's written agreement to pay a commission; is the broker then entitled to his commission?

A. Yes, provided that the papers sufficiently describe the property, name the parties, the amount of the commission, and either authorize or employ the broker named therein to sell the property, or ratify his employment.

Q. What is the difference between a contract giving a broker the exclusive right to sell and a contract giving him an exclusive agency listing with reference to real property?

A. In a contract for the exclusive right to sell real property, the owner is bound to pay a commission in case of a sale by any person, including himself; while in a contract providing for an exclusive agency listing, the owner merely agrees to employ no other broker in the sale of his property and the owner may sell the property himself without becoming liable for the commission.

Q. If a husband employs a real estate broker to sell real estate and the broker procures a purchaser ready, able and willing to buy on the husband's exact terms, and the wife then refuses to sign the deed so that the sale is never consummated, is the broker entitled to collect his commission, and if so, from whom?

A. Yes. From the husband.

Q. If one employs a broker to sell real estate in which he has no interest whatsoever and the broker finds a purchaser ready, willing and able to buy the real estate on the exact terms and for the exact price stated in the listing contract and then the employer, having no title, is unable to convey, is the broker entitled to his commission?

A. Yes. The broker has fully performed all that he agreed to do and is entitled to the agreed commission.

Q. What compensation can a broker recover for services in bringing about a sale of real estate where his contract of employment does not specify the amount thereof?

A. The Statute of Frauds provides in effect that a contract employing a broker to sell real estate must be in writing and if not in writing the contract is

void. It occasionally happens that such a contract, though written, fails to specify the amount or rate of compensation to be paid the broker.

It is well established in this state that if a broker would recover a commission, for services rendered in connection with the sale of real estate, he should see to it that the amount and the rate of his commission are clearly specified in writing in his contract with his principal; for, if the contract is silent on this point, he can recover nothing, even though his efforts have resulted in the sale of the property.

Now, it must be remembered that the final paragraph of an Earnest Money Agreement is a contract between broker and seller, and that extreme care should be used to see that the dollars and cents of commission to be paid is correctly entered.

In the employment contract the compensation is shown as a per cent of the selling price. In the earnest money agreement the percentage (actual amount) is shown. Do not get carried away and change the 6% of the employment contract to the decimal .06 in the earnest money—you might get just that—6 cents.

Q. Under what circumstances may a broker receive compensation from both parties to the same transaction? Can a broker represent both the seller and purchaser in a sale or exchange of real estate and collect a commission from both?

A. This question has been discussed by the Oregon Supreme Court upon several occasions and the circumstances outlined under which the broker's double employment is allowable. The rule is that if one employs a broker or accepts his services with knowledge of his employment by another the written agreement to pay commission can be enforced, if the transaction is otherwise fair and honorable.

The reason for the foregoing rule is based upon the fact that one cannot exercise his whole duty to two principals whose interests are conflicting, it being the duty of the agent for the seller to sell for the highest price and the duty of the agent for the buyer to buy for the lowest price.

Q. Where a real estate broker having no written contract for a commission brings about an exchange of properties and the parties to the exchange in their agreement with each other agree to pay a commission, may the broker recover the same?

A. No. This question was decided by our Supreme Court for the first time in the case of Rugh vs. Soleim, 94 Or. 329, 180 Pac. 830. The law governing the collection of real estate broker's commission requires that every commission contract be in writing, and provides that if the same is not in writing the contract is void and the commission is not collectible. In construing the Statute of Frauds, our Supreme Court has repeatedly held that it does not matter how efficient the broker may have been in bringing about a sale or how meritorius the services of the broker may have been, if the agreement to pay a commission is not embodied in writing, signed by the party to be charged, which shows the contracting parties, intelligently identifies the property involved, discloses the terms and conditions of the agreement, and expresses a consideration, the broker is helpless, legally, to collect the promised commission, notwithstanding that he brought about a sale accepted by the owner.

Q. Where an owner of real estate authorizes a broker to sell his property at a certain price, and the broker finds a purchaser who pays to the broker a deposit of earnest money to bind the sale, and the owner then refuses to convey, who is liable to the purchaser for the return of the earnest money, the broker or the owner?

A. In most of the cases where this question is involved, the broker is found trying to retain the earnest money on the theory that it is due him from the owner as a commission. Though recognizing that the broker has a valid claim against the owner, courts everywhere hold that the broker must look directly to the owner for his compensation, and that he cannot retain the deposit, thus, in effect, forcing the purchaser to pay the owner's debts.

Q. What is a sufficient description of real estate in a contract to buy or exchange the same? Must a correct legal description be given, or is it sufficient to refer to the land in general terms?

A. Quoting the Supreme Court: "A writing concerned with the sale of real property must identify the latter. It is common to say that the writing must describe the property, but, as indicated in Wigmore on Evidence, 3d ed., Sec. 2476, the connotation of the word "describe" exacts more than the Statute of Frauds requires. Parol evidence may be used for the purpose of supplying the description to the land, but it is never a valid substitute for missing description. . . . In the present instance, no part of the writing gives any indication whatever of the city, county or state in which the property is located; nor does it mention the place where the agreement was effected or the parties reside. As already indicated, no one with the paper in his hand would have any idea where to go in search of the property. In short, a material part of the description is missing and no part of the writing points to the source of evidence aliunde which will identify the property."

Q. Is it correct practice for a salesman to complete a sale and collect in his own name the commission and then give his broker-employer his share of the commission?

A. No. The salesman has no right to collect the commission; that right belongs exclusively to his employer; should the salesman receive the commission, he should deliver it immediately to his employer.

Q. When earnest money is received by a salesman, is he at liberty to make use of it for his personal account up to the amount of his share of the commission before the deal is closed? If not, what should he do with it?

A. No. Deposits of earnest money should be delivered by the salesman to his employer immediately; there are no exceptions to this rule.

Q. Is it legal for a broker to place a sign on property without the consent of the owner?

A. No.

Q. If a broker is assisted by his grocer in procuring a prospect or in closing a deal, is it lawful for the broker to pay the grocer for his services a fair and reasonable portion of his commission?

A. No.

8068

THE IMPACT OF TAXES

PROPERTY TAXES - GENERAL

All property taxes levied in Oregon are for local government use. They serve a variety of purposes. Some are general, as those for county-wide purposes of general government, support of county libraries, county hospitals, etc.

This type of tax is levied under the authority of the county governing body. Either the county court or the Board of Commissioners, depending upon the organization of the particular county.

Taxes for the various taxing districts, such as county, schools, fire, port, and many others, are based upon budgets approved by the respective governing bodies. In recent years, the levies for schools have constituted the biggest tax bite; some depend upon levies voted by the affected taxpayers.

All voter approved levies are those requiring approval because the levying body does not have the authority to make the particular levy, such as bonds, or a large levy for operating costs or capital improvements.

In addition to the regular ad valorem, or commonly termed "property taxes", many special districts created for limited purposes levy funds upon some basis other than value. Irrigation districts, for instance, may apportion their budget to those they serve at a uniform rate per acre. The resulting levy, in spite of this, will be reported to the county assessor who will enter it upon the assessment roll and certify it to the sheriff for collection, along with the ad valorem taxes imposed upon the same property.

LEVY

All counties, municipalities, districts, such as schools, fire, sanitary, and, at time some quasi-municipal corporations, are authorized to levy taxes which constitute a lien upon all of the taxable property lying within their respective geographical limits. A particular property may lie in several overlapping districts, in which case it will be subject to the levy of each district. In addition, all taxable property in the county is subject to any county-wide levy. The state of Oregon, itself, is presently prohibited from asserting any levy upon property in excess of that needed to satisfy debt service requirements. No state levy for even this limited purpose has been imposed for over 20 years.

All public bodies vested with the power of levying taxes shall make their levy in dollars and cents, and report the levy to the county assessor, who, in turn, computes the rate in dollars per thousand assessed value of levy by dividing the total assessed valuation for all taxable property within the particular taxing district into the amount of money proposed to be raised by taxation. The rate percent shall then be applied to the separate assessed value of each ownership for each taxing body within whose borders it lies. The aggregated taxes for each property will be the amount certified to the sheriff for collection with respect to the particular property. At this time, the assessment roll with the various levies spread upon it becomes the tax roll.

VALUATION

All taxable property is to be valued at TCV (true cash value). True cash value is market value unless the statutes provide otherwise. For exceptions see ORS 321.617 and 308.370. The assessor is charged with the duty of assessing each property in accordance with the best information he can obtain. The assessed values so determined are entered upon the assessment roll in accordance with the provisions of ORS 308.215. The roll consists of a listing of the names of all persons in his county owning real property, or having control, of taxable personal property; a description of each parcel of real estate, including its area, and the assessed value, separately, of the land, improvements, timber and personal property.

The Oregon procedures for obtaining market value (true cash value) for assessment purposes is shown in the Valuation and Appraising section of this Manual.

The 100 percent ratio (market value) was first used for the 1968 tax roll. The stating of the levy in dollars and cents per $1,000 of TCV was first done in respect to the 1967 roll. Both changes were the result of 1967 legislation. The use of terms in dollars and cents, rather than in millage, has found favor with Oregon taxpayers.

The reappraisal of real property was completed in 1966 and the Department of Revenue and county assessors are now engaged in a maintenance program. Assessors are obliged to reappraise each property at least once every 6 years "that equality of taxation according to law shall be secured".

FARM USE LAND

Owners of agricultural lands entitled to the farm use zone special assessment must make application with the county assessor

on or before April 1 of each year. If an owner does not re-apply for this special assessment, the assessor will notify him of his rights not later than April 10. He then has not later than May 1 to apply, but must pay a late filing fee of $10.

"Farm Use" means the current employment of land for the purpose of obtaining a profit in money by raising, harvesting, and selling farm products.

Farm use land shall not be regarded as being used for the purpose of obtaining a profit in money if the whole parcel has not produced a gross income from farm uses of $500 per year for 3 of the 5 calendar years immediately preceding assessment.

In using comparable sales to appraise agricultural land for farm use assessment the legislature stated, "It is the legislative intent that bona fide farm properties shall be assessed at a value that is exclusive of values attributable to urban influences or speculative purchases."

APPEALS

While the assessor is charged with making his assessment on the basis of the best information available to him, his determinations are not necessarily final.

If a taxpayer feels the assessor's true cash value of a particular property is out of line with comparable properties in the neighborhood, he should first request the assessor to review the appraisal. The assessor may make an adjustment as late as May 1.

If the taxpayer is still dissatisfied with the assessor's determination, he may appeal by petition to the County Board of Equalization. Forms for this purpose are available from the county clerk or county assessor.

From the Board, he may appeal directly to the Department of Revenue or, in certain cases, directly to the Oregon Tax Court's Small Claims Division.

The latter's jurisdiction covers real property whose true cash value for either the parcel of land or the total improvements thereon is not over $25,000, and personal property where the true cash value does not exceed $10,000.

If the taxpayer appeals directly to the Small Claims Division, the decision is final and no further review is permitted.

Decisions by the Department of Revenue may be appealed to the

Tax Court, and the Tax Court's decisions (except in the Small Claims Division) to the Oregon Supreme Court.

PERSONAL PROPERTY

All items of tangible personal property held by the owner for delivery or by a vendor to him, for his personal use, benefit or enjoyment are exempt from taxation.

The exeption does not apply to any such property held by the owner, wholly or partially for use or sale in the ordinary course of a trade or business or for the production of income, or solely for investment or to personal property required to be licensed or registered under the laws of the state.

Assessment procedures with respect to personal property are based upon the same TCV standards that are used for real property. They are also entered into the assessment roll in a similar manner, but there are some differences in methods. (1) The assessor may assess and collect the tax upon transient merchandise, upon discovery, at the rates established for the current year (2) the owner or the person having in his control taxable personal property shall make a return to the assessor of the county in which the property is situated before March 3 of each year. The return (which is confidential) shall set forth a complete listing of such property and a statement of its TCV. The same channels of relief from the assessor's findings are available that were previously described under "appeals" with respect to real property.

TIMBER TAXES

At present there is a distinction between the methods provided for the taxation of timber in Western Oregon (ad valorem) and Eastern Oregon (severance for timber and ad valorem for land). The dividing line runs from the northern boundary of Oregon along the western boundaries of Wasco, Jefferson, Deschutes and Klamath counties to the southern boundary of the State of Oregon. Western Oregon ad valorem values are based upon appraisals by the State Tax Commission, and made available to the county assessors and boards of equalization. Special provision is made for classified reforestation land. After approval and classification by the State Forester and the State Tax Commission, such classified lands are subject to an annual forest fee of ten cents per acre in Western Oregon and five cents per acre in Eastern Oregon, which will be charged in lieu of the prescribed ad valorem and severance taxes, respectively, during the period of classification as reforestation lands, plus a yield tax on all forest crops harvested from such lands.

CENTRALLY ASSESSED PROPERTY

Centrally assessed properties in Oregon consist of the properties of the so-called public utility group whose properties usually extend across county lines within the state, and frequently into other states as well. Valuation of such properties presents almost insurmountable difficulties as far as the county assessor is concerned. Because of this the State of Oregon has charged the State Tax Commission with the duty of valuing such properties within the state, and of apportioning those values among the counties, municipalities, and districts within which they operate or own property.

The values are certified by the State Tax Commission to the assessors of the various counties, who then enter the values upon the tax rolls. These properties are then subject to the various appropriate levies in the same manner as for properties which have been assessed by the assessor.

TAX YEAR AND PAYMENT

While property taxes are related to values as of January 1 of each year, the tax year in Oregon is actually the fiscal year ending on June 30. Taxes are due and payable on November 15 of each year, and if paid in full are subject to a discount.

Property taxes may, however, be paid without penalty in quarterly installments due on November 15, February 15, May 15 and August 15.

Prorations of property taxes between seller and buyer of real property are therefore made upon the basis of the twelve month period commencing on July 1 of one year and ending on June 30 of the following year.

The lien date also controls the assessment of taxes upon real property passing into or out of public or exempt ownership. In other words, if the property is subject to tax on July 1, it shall remain taxable for the ensuing fiscal year. If property exempt from taxation is transferred to non-exempt ownership, or use, between January 1 and June 30 of any year, it will be taxable for the fiscal year next ensuing.

Taxes normally attach to and become a lien upon the affected property as of what is commonly known as "tax day" -- the date to which the valuation is related. This is true in Oregon with regard to the tax upon personal property, but a statutory lien date of July 1 is provided with respect to taxes upon real property. This corresponds to the tax year for which the tax is assessed.

8073

TAX DISCOUNTS

Oregon statute provides for a discount for prepayment of real property taxes. If payment of the tax is made on or before November 15 a discount of 3% is allowed. If three-quarters of the tax is paid on or before this date the discount is 2%; if one-half is paid the discount is 1%.

TAX PENALTIES

The term "penalty" for non-payment of taxes on or before the due date is loosely used to describe the "interest" charged and collected on unpaid taxes.

Interest on unpaid taxes accumulates at the rate of two-thirds of 1% per month on each quarterly installment from its due date until paid. A fraction of a month is counted as a full month.

DELINQUENT TAXES

Real property taxes are "delinquent" on August 16 following the expiration of the fiscal year. Taxes for the current tax year beginning July 1, are delinquent if not paid by August 16 of next year.

Tax foreclosure proceedings against a parcel of real estate begin whenever three years have elapsed from the date of the earliest delinquency.

Where the total tax charged on any parcel of property amounts to $10, or more, a partial payment of $2.50, or more, may be made at any time, but this payment is first applied against any accrued interest.

INCOME TAXES

Every real estate transaction affects someone's income tax return. The tax effects of a transaction are inherent. Nothing that occurs later will affect it. Tax planning, therefore, should be an essential part of every transaction. All parties involved, particularly the vendors of real property, should be advised by their broker to seek competent counsel, that they may be advised in advance of what the tax consequences to them will be.

Many, if not most, real property transactions can be consummated in more than one manner. Usually, one will prove to be less costly taxwise than the alternatives. The tax consequences may hinge upon

such questions as whether or not certain liabilities should be assumed by the buyer; whether the FMV (fair market value) of third-party obligations, accepted as partial compensation, will adversely affect the right to installment reporting; and, countless other items which, although they appear harmless, are actually of major importance in determining the tax result.

The importance of tax counseling appears in its true light when we examine a few of the multitude of ways in which a tax return can be affected by everyday transactions in the real estate field.

INSTALLMENT SALES

It may be desirable to defer the tax on the gain attributable to a particular transaction into the years in which that gain is actually realized.

A lack of care in providing for the initial payment, which is not limited to the amounts paid to the seller at the time of the sale, but includes, in addition, all payments on principal received during the year of the sale, monies used to defray the cost of the sale, to pay back taxes, and to defray any obligations of the seller may nullify the intent to defer the tax. Differences between the FMV and the face value of third-party paper received as part of the initial payment may affect the right to report upon the installment basis, and further, may result in that difference being treated as ordinary income when received, thus sacrificing part of the capital gain treatment advantages.

EXCHANGES

Contrary to the popular impression, like-for-like exchanges, involuntary conversions, and similar transactions are not tax-free. Such transactions frequently produce a tax consequence, which is subject to deferral, but must be taken into consideration upon disposition of the replacement property. It should be noted that Oregon places some restrictions upon tax deferrals, which result in some distinctions between application for Oregon and Federal purposes. For example, Oregon law authorizes deferral of tax in the case of like-for-like exchange, in reinvestment of proceeds received under provisions of involuntary conversion section and reinvestment in a personal residence <u>only</u> if the replacement property is located with Oregon.

Mortgage assumption as a part of either a sale or an exchange may at times serve as a catalyst that will materially change the taxable nature of the transaction. Receipt of "boot", which may consist of money, property other than money, or assumption of liabilities,

may result in taxable gain to the extent of the boot in what would otherwise have been, at that time, a deferred tax transaction.

TWO INCOME TAXES

Taxpayers in Oregon are subject to two income taxes -- one imposed by the United States Government and one by the State of Oregon.

"The consequences of the two are generally similar with respect to a given transaction. For tax years beginning on or after January 1, 1969, the State of Oregon has adopted as a tax base the federal definition of taxable income. In general, the State of Oregon determines taxable income with reference to the federal taxable income with certain specific adjustments. Therefore, in most instances the tax consequences of a transaction will be the same for the State as it is for the federal. One notable exception to this is noted above under "exchanges" where the property acquired in an exchange, involuntary conversion, or in acquiring a personal residence is not located in Oregon. In such a case it is likely that all of the "potential" gain will be taxable for Oregon purposes.

We have noted previously that the State of Oregon is precluded from the imposition of a tax upon real property for general state purposes. This tax, used for the support of other political subdivisions of the state, is based on the theory that all property equally enjoys the benefits and protection of government; and, therefore, all property is required to bear its equal share, prorate, of local government expense.

The income tax, in addition to absorbing the cost of state government, is in turn funneled back in large amounts to relieve property taxes at the local level through what is known as the "Basic School Fund Act". This diversion has been in a constantly increasing amount in recent years. First, because of the steadily increasing number of children shown by the School Census, and, secondly, by a constantly accelerating amount per child.

All income tax returns are subject to audit. Determinations of the examining agents are subject to review by a higher authority upon proper protest, or appeal, by the taxpayer. While similar channels of relief are available to the taxpayers, under both Oregon and Federal law, some differences of methods apply under the respective laws. For that reason, a summarized approach is provided here with respect to the separate jurisdictions.

OREGON PRACTICE

(1) The State of Oregon Department of Revenue will transmit a

copy of the auditor's report, together with a notice which advises the taxpayer (a) that he may, if he does not agree with the examiner's findings, discuss the matter with the auditor in charge of the office that originated the notice, who has authority to modify or cancel the proposed assessment on the basis of failure of the examining auditor's determination to be in accord with the facts, or (b) a request for a conference may be filed with the Administrator of the Income Division, State of Oregon Department of Revenue within 30 days of the date of the notice. This may either follow or be without benefit of the discussion referred to in (a) above. The conferee has full authority to revise within the policy structure established by the Department of Revenue.

(2) Assuming that the conferee (Income Division of the Department of Revenue) sustains the auditor in whole or in part, a 30-day notice of assessment will be issued. Following the issuance of this notice, an appeal may be taken to the Director of the Department of Revenue. In the event the proposed tax for no one of the years involved exceeds $250, an appeal may be directed to the Small Claims Division of the Oregon Tax Court instead of to the Commission. This is a matter of choice as far as the taxpayer is concerned. Small claims decisions are not appealable, the determination of the Court being final.

Appeals directed to the Director of the Department of Revenue involve a semi-formal hearing before the Department, followed by the issuance of a Department of Revenue order and opinion. This Order may be appealed to the Regular Division of the Tax Court, and then on to the Supreme Court of the State of Oregon.

FEDERAL PRACTICE

(1) The examining agent will discuss any possible adjustment with the taxpayer, or his representative, and solicit his signature to an acceptance of his findings.

(2) If the taxpayer refuses to accept the agent's findings, he will receive a letter explaining the proposals and inviting him to an informal conference. The letter forms the basis for the conference.

(3) If the taxpayer still does not agree, he will receive a 30-day letter. This includes a copy of the examiner's report and a notice that if the contest is to be continued, that a protest must be filed within 30 days.

(4) The taxpayer has several choices at this point. He may (a) do nothing and await the issuance of a 90-day letter, or (b) he may by letter state that he does not agree, but waives an Appellate

Division hearing; (c) accept the examiner's finding; (d) submit a protest requesting that the case be referred to the Appellate Division for hearing and review.

(5) The last notice is a 90-day letter which is a formal notice of deficiency and may follow (4) (a) (b) or (d) above, and advises the taxpayer that he may petition the Tax Court for a review of the deficiency within the 90-day period. Further appeals may follow the Tax Court determination to the appropriate Circuit Court of Appeals, and, on occasion, to the U. S. Supreme Court.

VETERANS AND THEIR WIDOWS

Oregon has recognized the services of war veterans by providing for direct tax exemptions on real property which is the homestead of such persons.

The exemption amounts to $7,500 of the true cash value of the homestead of the person qualifying. The application must be filed each year between January 1 and April 1 with the county assessor of the county where the property is located. The county assessor furnishes the required application form. Any supporting evidence required by law should also be submitted before the deadline. Those entitled include:

1. Any war veteran with a 40 percent disability or more, as certified by the Veterans Administration or by a branch of the Armed Forces. The veteran receiving a total and permanent, non-service connected pension from the VA is entitled, the same as the veteran with a 40 percent service connected disability. There is no limit on the amount of income a veteran in this category may receive to be entitled. Recipients of the Armed Forces Expeditionary Medal and the Vietnam Service Medal qualify as war veterans under Oregon law.

2. The unremarried widow of a war veteran. She must submit proof of her husband's military service and copies of the marriage and death certificates if she had not done so previously. There is no limit on her income. Pensioned widows of Spanish-American War Veterans get an additional $2,000 exemption on their homesteads only, based on taxable value. Widows of Medal recipients cited above qualify.

3. Any honorably discharged veteran of the Spanish-American War, the Philippine Insurrection or the Boxer Rebellion, regardless of disability. No income limitation.

In a separate category is the veteran with a disability which cannot be certified by the VA or the Armed Forces. If his county

health officer and one other licensed physician in his county certify that he has a disability of 40 percent or more, he may receive the property tax exemption provided he has not received more than $2,500 total gross income during the last calendar year.

Veterans whose disabilities are certified by the VA can and should obtain a statement each year from the VA regional office to submit to the county assessor certifying to the existence of the disability.

Veterans whose disabilities are not on record with the VA, but rather with a branch of the Armed Forces, should obtain one statement -- preferably in triplicate -- every three years from that service branch. The statement should be to the effect that disability is current. One copy of this statement should be filed each year with the claim for tax exemption.

Veterans Over Age 65: Veterans no longer have to file the annual certificates of disability if they had once filed them after reaching age 65. They do have to continue to apply annually for the tax exemption.

Property Acquired After March 20: The veteran who acquires property after March 20, and before July 1, has 10 days following the date of acquisition to apply for the tax exemption. If he acquires the property on or after July 1, he cannot get the exemption for the current year.

Transfer of Exemption: If, after April 1, a person receiving the property tax exemption sells his property and purchases another property on or before June 30, he may transfer the tax exemption to the new property provided he applies for the transfer within 10 days of acquiring the new property.

If he sells his property after June 30 (and before October 15), then he may transfer his tax exemption only to property which he already owned or held under a recorded contract on or before June 30. He must submit proof to the county assessor of the ownership of the alternate property to which he wishes to transfer his exemption. If his property sale occurred after October 15, he loses the tax exemption for the current year.

Life Estate Clause: If a veteran enjoying the property tax exemption deeds his property over to his children by a deed reserving a "life estate" to the veteran -- that is, the deed contains a provision that he may continue to reside on the property so long as he lives -- he may continue to receive the property tax exemption if he actually uses the property as his homestead.

Wife Owner of Homestead: If a war veteran lives with his wife

in a house owned by her, the house is considered their homestead and the veteran can claim the exemption under ORS 307.270 which states: ". . . real property of the wife of any such veteran where they are living together and occupying the same as their homestead shall be deemed the homestead of the veteran."

MOBILE HOME EXEMPTIONS

An annual license fee reduction of up to $100 on the mobile homes in which they reside is provided the Oregon veterans.

The qualifications are the same whether a veteran lives in a mobile home or a house.

The reduction will not be allowed to veterans who in the current calendar year received a property tax exemption or who did not receive a reduction on another mobile home at anytime during the last 12 months.

SENIOR CITIZEN PROPERTY TAX EXEMPTION

Oregon law contains provision for property tax relief to individuals 65 years of age and over.

The relief granted is a percentage of the first $10,000 of the true cash value of the taxpayer's homestead, dependent upon the age of the taxpayer as of March 1 of the year in which claim for exemption is filed, as follows:

65 to 68 years.....	10%
69 to 71 years.....	30%
72 to 74 years.....	50%
75 to 77 years.....	70%
78 to 79 years.....	90%
80 and more years.....	100%

The exemption shall only apply if the household income of the taxpayer does not exceed the sum of $3,000 during the last preceding calendar year. Household income is defined under the statute and includes all incomes of residents of the homestead who are related to the claimant.

In order to gain the exemption the claimant must file with the assessor on or before April 1 of each year. If the property is acquired after March 20 and before July 1, the claim must be filed within 10 days of the date of acquisition.

The exemption is lost if the taxpayer ceases to reside permanently

on the property at any time before the assessment roll becomes the tax roll. If, however, he dies before that time the exemption will extend to his widow.

A war veteran cannot claim both the veteran exemption and the senior citizen exemption.

SENIOR CITIZEN PROPERTY TAX DEFERRAL

Although not an exemption, Oregon law provides a procedure to defer payment of taxes for individuals 65 years or over.

The deferral of the tax is applicable only to the homestead of the applicant, and the property must be non-income producing. The deferred taxes become a lien against the property.

Forms for such deferral must be filed with the county assessor and state treasurer on or before April 1 of each year. Payment of the deferred tax to the political subdivisions is made by the state treasurer from a special fund.

The deferred taxes, including accrued interest at 6 percent per year, becomes due when the claimant dies or the property is sold. A surviving spouse 60 years of age or older can elect to continue the deferral.

ONCE IN LIFETIME FEDERAL TAX BREAK

Under certain conditions an individual 65 years of age or over is given a one time only tax exemption under federal law.

This individual can sell his home at an "adjusted sale price" of $20,000 or less and pay no tax on any capital gain. Adjusted sale price means you deduct real estate commission, sales expense, and fixing up expense from the full sale price.

PERSONAL PROPERTY IN TRANSIT (Free Port)

Persons and firms seeking tax exemption on personal property in transit must file a written statement with the assessor on or before April 1 of each year.

Property eligible for exemption is goods, wares and merchandise destined for sale in the ordinary course of trade or business, manufactured or produced outside the state and brought into the state for transshipment to an out-of-state (other than county of origin), while being shipped or while held in public or private

storage awaiting further shipment.

Such property is not deprived of exemption because while in the warehouse the property is assembled, bound, joined, disassembled, divided, cut, broken in bulk, labeled, packaged, relabeled or repackaged.

COUNTY BOARD OF EQUALIZATION

In order to be of maximum assistance to clients every real estate licensee should be familiar with the functions of Oregon's 36 County Boards of Equalization.

Each Board consists of three members. One member of the Board is a member of the County Court of County Board of Commissioners. One is a member of the Budget Committee or the Tax Supervision and Conservation Commission. The third man is a free holder appointed by the above two. The County Court or Commission is <u>not</u> the appointing authority. See ORS 309.020.

The Board meets first in November to review assessment quality and levels. This meeting provides an opportunity for the board members to guide the assessor in his preparation of the assessment roll.

The Board meets again in April to review the assessor's progress. In May, the Board meets for a three-week period to equalize the assessment roll and to hear taxpayer appeals for reduction in assessed values.

UNIFORM FEDERAL TAX LIEN
REGISTRATION ACT

The Uniform Act, adopted by the 1967 legislature, requires that notices of liens upon real property for taxes payable to the federal government shall be filed in the office of the recorder or clerk of the county in which the real property is situated. The statute provides for a $1 filing fee.

Upon request the filing officer is required to issue his certificate showing whether there is on file in his office a federal tax lien. He will charge $1 for the certificate plus 50 cents for each lien of record.

BANCROFT BONDING ACT

A method permitting property owners to pay assessment costs for

city improvements of streets, sidewalks, street lights, sewer or water mains, or off-street parking facilities by installments.

The assessments are paid in semi-annual installments, bearing interest at the rate of 7 percent, and spread over a period not to exceed 10 years. The assessment is a lien against the real property benefitted by the improvement. This lien has priority over all others.

Immediate costs of the improvement are paid by the city through the issuance of general obligation bonds. The law limits the city to an issuance of such bonds to an amount not to exceed 15 percent of the assessed value of all real property.

TAX CALENDAR

January 1 - Assessment date for all property. Lien date for personal property taxes.

March 3 - Final date for filing personal property returns with county assessor.

On or before April 1 - Deadline for filing proof for exemption of commercial facilities under construction - county assessor.

February 15 - Second quarter property taxes due.

April 1 - Last day to file claims for exemption with county assessor. These include veterans' exemptions, senior citizen exemptions and special assessment of unzoned farm land, as well as institutions and organizations claiming exemption.

April 15 - Final day for filing income tax return.

May 1 - Assessor must notify property owner if valuation has been increased more than $400 or 5%, whichever is greater. The notice must be mailed out not later than the first Monday in May.

2nd Monday in May - County Board of Equalization meets to hear appeals.

Third Monday in May - Last day to file petition for assessment review. Third quarter property taxes due.

July 1 - Lien date for real property taxes.

August 15 - Fourth quarter taxes due.

October 15 - Last day for delivery of the assessment roll to the tax collector (sheriff) by the county assessor.

November 1 - Assessor mails tax statements prior to this date.

November 15 - First quarter taxes due and final date for full discount for full payment.

Q. 17 A property owner is preparing his Federal income tax return. He may be allowed to take a depreciation deduction on all of his following property, except:

(A) an apartment building
(B) a home he rents to a friend
(C) a vacant duplex
(D) land held for investment

Q. 18 An exchange of property of like kind frequently results in the postponement of tax on any gain realized. Which of the following would not qualify for a non-taxable exchange?

(A) an apartment house for a warehouse
(B) timberland for farm equipment
(C) an office building for a hotel
(D) a city lot for a ranch

Q. 19 Interest is charged for failure to pay real property taxes on or before the due date. What is the interest rate on an annual basis?

Q. 20 On what month and day of each year do real property taxes become a lien on the property?

Q. 21 What is the interest rate provided for in the Bancroft Act for the installment payment of local improvement assessments against real property?

8084

Upon proof made to the satisfaction of the State Engineer that an appropriation has been made under the terms of a permit, a certificate of water right is issued as conclusive evidence of the extent of the completed water right.

Neither the permit nor a certificate assures that water will be available at all times. It authorizes the use of water for beneficial purposes to the extent that it may be available in excess of the needs of prior rights.

Authority of the State Engineer does not extend to matters of property rights; therefore, acceptance of an application or the issuance of a permit should not be construed in any sense as granting a right of access to a stream or any right of way for construction or maintenance of works necessary to the use of water.

All rights of access and right of way must be obtained from the owner of the property involved.

ARE THERE WATER RIGHTS FOR THIS PROPERTY?

All legal established water rights, whether they may be incomplete rights under permits, undetermined claims through ground water registration statements, or completed and perfected rights evidenced by certificates of water right, are of record in the office of the State Engineer. Copies of the records pertinent to a watermaster district are also maintained in the offfice of the watermaster for the particular district. *To determine whether there is a legal right* of record for the appropriation of water for use upon a particular tract of real property or to divert water from a source within the property, you may *contact the office of the State Engineer,* 516 Public Service Building, Salem, Oregon 97310, *or the watermaster* for the district within which the property is located. The name and office address of the watermaster or watermasters concerned with your area will be furnished upon request.

It will be necessary for you to furnish a copy of the legal description of the property as it would appear on a deed *or a map* which shows the boundary of the property in relation to section lines and section subdivision lines. If the legal description describes the property as a portion of a platted and recorded subdivision, a copy of the recorded plat should accompany the legal description.

CHANGE OF OWNERSHIP

A *completed and perfected water right* as evidenced by a certificate of water right is appurtenant to the lands on which the right was established and passes with the land through change of ownership, unless specifically reserved in the articles of conveyance. There is no statutory provision for transferring or assigning a completed and perfected water right from one owner to another.

An *incomplete right* under a water right permit or a ground water registration statement can be conveyed to a new owner only through the recording of an assignment in the office of the State Engineer. Forms for this purpose are supplied upon request. If the assignment is not recorded it is not binding on anyone but the parties thereto and may result in cancellation of the water right.

HOW LONG DOES THE RIGHT LAST?

A completed and perfected water right as evidenced by a certificate of water right remains valid and in force so long as it is not lost through intentional abandonment or through non-use for a period of five successive years or more.

Q. 22 Underground water not confined to a known and well defined channel is known as percolating water. This water is:

(A) owned absolutely by the land owner
(B) owned by the county
(C) available for beneficial use by other landowners.
(D) available only to the first user.

Q. 23 What is meant by the words "water table"?

PLATS AND SUBDIVISIONS

Land development quite generally means the creation of a "subdivision." Since the 1963 Legislature, regulation of subdivisions by agencies of government extends into four fields.

Depending upon the progress of the subdivision or its nature, regulatory bodies are the city and county authorities in which it is located, the real estate commissioner, or the corporation commissioner.

The subdividing of land for many years has been regulated by the governing bodies of counties or cities, usually through a planning commission.

Under Chapter 92, Oregon Revised Statutes, county and city governments have sought to accomplish the orderly development of the land within the jurisdiction of such county or city, and to promote the public health, safety and general welfare of the county or city.

The 1963 Legislature passed what is known as the "Oregon Subdivision Control Law", intended to regulate the promotion and sale of subdivided lands.

This Act is intended to protect the public from fraud, deceit and misrepresentation in offerings of tracts of marginal or submarginal lands in this and other states. This Act is administered by the real estate commissioner.

In the absence of another name we will call Chapter 92 the "Plat and Map Act." The intent of both Legislative Acts is spelled out in the law itself, and appear to give the counties and cities prior jurisdiction in the creation of subdivisions, and the real estate commissioner authority over the sale of lots or parcels in such subdivisions.

While there is some slight difference in the definitions contained in each Act, those found in the "Plat and Map Act" are generally applicable to both.

"Plat" includes a final map, diagram, drawing, replat or other writing containing all the descriptions, locations, specifications, dedications, provisions and information concerning a subdivision.

"Subdivide land" means to partition a parcel of land into four or more parcels of less than five acres each for the purpose of transfer of ownership or building development, whether immediate or future, when such parcel exists as a unit or contiguous units under a single ownership as shown on the tax roll for the year preceding the partitioning.

This definition does not apply to the division of agricultural land into tracts of five or more acres if it is to be used for agricultural purposes, provided, such division does not involve any new roads or streets or the widening of any existing thoroughfare.

Note: The Oregon Subdivision Control Act does not include this latter exclusion of agricultural land. Nor does it make reference to the size of the divided parcels.

"Subdivision" means either an act of subdividing land or a tract of land subdivided or partitioned for the purpose of transfer of ownership or building development.

Before starting a land development program the prudent developer will first contact his county surveyor. Real estate practitioners should be familiar with an Oregon statute that reads "the county surveyor shall within 10 days, when called upon, survey any tract of land or town lot lying in his county, at the expense of the person demanding the same, if his legal fees are first tendered."

It may come as a surprise to many real estate practitioners to learn that "subdivision" also includes certain types of multi-family structures. Some types of apartments or adjoining single family dwellings are known in many parts of the nation as "vertical" or "horizontal" subdivisions, and under Oregon law require certain governmental approval. These are discussed following the requirements for approval under the "Plat and Map Act" and the "Oregon Subdivision Control Law."

Plat and Map Act

No person shall sell or offer for sale any lot or parcel of land in any subdivision until final approval has been obtained from the proper authorities.

Before any subdivision of land can be made the owner or his agent must make an application in writing to the nearest planning agency in the county or if there is no such agency to the county court. A tentative map of the proposed subdivision is submitted to the planning commission or to the governing body of the county. The approval of the tentative map, however, does not constitute a final approval of the plat for recording.

If the land being subdivided is within the jurisdiction of any city in Oregon which has a planning commission the plat for the subdivision must be approved by the planning commission. If there is no planning commission, then by the governing body of the city.

Where a county has no planning commission, land within six miles of the corporate limits of a city is under the jurisdiction of the city for the purpose of giving approval to plans or plats.

No sales or offers to sell shall be made until the approved plat has been recorded in the office of the appropriate county recording officer.

REQUIREMENTS OF SURVEY AND PLAT OF SUBDIVISION

The plat of a subdivision cannot be recorded until all the requirements for the survey and final map have been met. The requirements are as follows:

a. The survey for the plat of the subdivision must be of such accuracy that the error of closure does not exceed one foot in 4,000 feet.
b. That the survey and plat of the subdivision be made by a surveyor who is a registered engineer or a licensed land surveyor.
c. The plat of the subdivision must be of such a scale that survey and mathematical information and other details can be easily obtained from it. All of the streets must be named. Each block must be lettered or numbered and all the lots numbered. The length and width of all lots must be clearly shown.

OREGON SUBDIVISION CONTROL LAW

The subdivision control law does not apply to the sale or leasing of apartments, offices, stores or similar space within an apartment building, industrial building or commercial building.

It does not apply to subdivided lands in Oregon containing less than 20 separate lots or parcels, which are not in unit ownership created under ORS 91.505 to 91.675 but which are contained within a recorded subdivision plat which has met the requirements of ORS 92.020 to 92.160, or as an alternative have met the following conditions:

(A) Each lot is situated on a dedicated road or street constructed to the specifications of the county commissioners of the county or the governing body of the municipality which has accepted such road or street for maintenance; and

(B) The subdivision has drainage structures and fill necessary to prevent flooding, which structures and fill have been approved by the county commissioners of the county or the governing body of the municipality; and

(C) Electric power is available at or near each lot; and

(D) Domestic water supply and sanitary sewage disposal are available at or near each lot, meeting the requirements of the State Board of Health, the Sanitary Authority of the State of Oregon and, in the case of septic tanks, the local health department of the county in which the land is situated.

NOTICE OF INTENTION

Before any subdivided lands in another state are offered for sale or lease in Oregon, or before any subdivided lands within the state are offered for sale or lease, the subdivider or his agent must notify the Real Estate Commissioner in writing of his intention. The notice is known as a "Preliminary Notice of Intention".

This notice must contain:

(1) The name and address of the subdivider.
(2) The names and addresses of all members of his sales force.

(3) The legal description and area of the lands, the proposed plat, or a certified copy of the subdivision plat recorded in the city or county records, and a map showing the proposed layout and its relation to existing streets or roads and utilities.

(4) A brief but comprehensive statement describing land and location.

(5) A statement of the condition of the title to the land.

(6) A statement of the provisions that have been made for legal access, sewage disposal and public utilities in the proposed subdivision, including water, electricity, gas and telephone facilities.

(7) A statement of the intended use of the property.

(8) A statement of any restrictions limiting use or occupancy of the parcels.

A preliminary notice of intention shall be accompanied by a filing fee of $10.

REQUEST FOR FURTHER INFORMATION

After an examination of the preliminary notice, the commissioner may require further information. This information will include:

(1) Terms and conditions on which it is intended to transfer ownership, together with copies of any contract, conveyance, lease, assignment or other instrument.

(2) Copies of sales pamphlets and literature to be used in the sales.

(3) Any other information the subdivider cares to present.

In his reply to a request for further information the subdivider shall give proof of his financial ability to complete improvements and facilities which are required by the appropriate state, city and county authorities, and those promised to prospective purchasers.

FEES FOR ADMINISTRATION

The subdivider's reply to the first request for further information requested by the Commissioner under subsection (1) of this section shall

be accompanied by a fee as follows:

(a) For subdivisions containing 10 lots or parcels, or less, $40;

(b) For subdivisions containing over 10 but not more than 25 lots or parcels, $90;

(c) For subdivisions containing over 25 but not more than 50 lots or parcels, $190;

(d) For subdivisions containing over 50 but not more than 100 lots or parcels, $290;

(e) For subdivisions containing over 100 lots or parcels, $490, and $2 for each additional lot or parcel over 100 up to a total maximum of $1,000.

EXAMINATION AND PUBLIC REPORT

For the purpose of obtaining information necessary to compile a public report for the guidance of investors or purchasers, the commissioner may make an examination of the subdivision.

USE OF PUBLIC REPORT

The selling or leasing of any lot or parcel in a subdivision prior to issuance of the public report is prohibited. The public report is intended to be given to each prospective purchaser, and the commissioner may require the subdivider to take and keep a receipt of delivery of such report.

Use of the public report, other than in its entirety and without alteration, for advertising purposes is prohibited.

FEES FOR EXAMINATION

Whenever an examination is made of subdivided lands, no matter where located, the following fees shall be paid in advance by the subdivider:

An amount equivalent to 10 cents a mile for each mile to be traveled in going to and returning from the location; and an amount estimated to be necessary to cover the additional expense not to exceed $100 a day for each day consumed in the inspection.

Under this plan an association is formed of members, each issued a share of stock in the enterprise and given the right to occupy a particular dwelling erected on the tract. After certain conditions are met, the title is distributed to members covering the homes or apartments they individually occupy.

Completion of such projects depends upon the sale of a certain percentage of the stock, which means that a certain number of potential home purchasers must be obtained before such a project can be closed.

Any type of such a corporation must first be approved by the Corporation Commissioner, and it is advisable that any plans for such a co-operative project be first submitted to the Corporation Commissioner for study and advice.

Unit Ownership Act

Continued popularity of the "condominium", or multiple-unit building or buildings in which each unit is owned in fee simple absolute by a person who also holds an undivided interest in the common elements, led to passage of the "Unit Ownership Act" by the 1963 Legislature.

The law requires the owner of any property qualifying under the terms of the Act to file a declaration in the office of the recording officer in the county in which the property is located.

Before a declaration may be recorded it must be approved by the county assessor and the tax collector of the county. No declaration shall be approved if the property bears a name that is the same or similar to the name of another property in the same county, or until all taxes and assessments due and payable have been paid.

EXCLUSIVE OWNERSHIP AND POSSESSION

The law provides that each unit owner shall be entitled to the exclusive ownership and possession of his unit. A unit in the building may be individually conveyed and encumbered and may be the subject of ownership, possession or sale as if it were sole and entirely independent of the other units in the building, and individual titles and interests shall be recordable.

The undivided interest in the common elements shall not be separated from the unit to which it appertains and shall be conveyed or encumbered with the unit even though such interest is not expressly mentioned or described in the conveyance or other

8091

instrument.

At the time of recording the declaration a copy of the by-laws adopted by the unit owners governing the administration of the property must also be recorded.

The by-laws shall provide for the election of a board of directors from among the unit owners; a chairman, secretary and treasurer; provision for maintenance, upkeep and repair of the common elements; and the manner of collecting from the unit owners their share of the common expense.

FEDERAL LAW

Under certain conditions, developers of tracts containing 50 or more lots are subject to the Interstate Land Sales Full Disclosure Act.

This law is administered by the Office of Interstate Land Sales Registration in Washington, D. C.

Q. 24 What is the "police power" of the state?

Q. 25 What is a "plat"?

Q. 26 An owner of land, planning to sell smaller units comes within the jurisdiction of Oregon's subdividion control law when he partitions the tract into how many lots or parcels?

Q. 27 What is "marginal land"?

VALUATION AND APPRAISING

It has been said that a professional appraiser is not a first-class salesman. If true, it only endorses a much older truism that "a servant can not serve two masters."

Inversely, experience has taught that a good salesman is a better salesman if he has a working knowledge of the principles and fundamentals of appraising.

The good appraiser, conscious always that "people make value", is a better appraiser if he has first-hand knowledge of the fundamentals of selling.

The recognition of the amenities offered by a particular property, plus a knowledge of selling techniques, separate the successful from the mediocre in real estate.

An Oregon real estate license gives to the holder the right to make fee appraisals. Without such a real estate license appraising for a fee is unlawful.

Various governmental agencies and lending institutions have staff appraisers, who usually are not licensed to practice real estate. The successful applicants for a civil service job as an appraiser are certified as available for employment, and recently have come to be known as "certified appraisers."

The liberal provision of the real estate license law could, and may sometimes, be abused to the detriment of the public. The necessity of ability, skill, perfection and intellectual honesty in the fee appraiser may soon lead to special licensing requirements for such individuals. A qualified salesman can do fee appraising but only with the knowledge and approval of the employer-broker.

In Oregon state and local government appraisers have their own organization known as the Society of Certified Appraisers. Tax appraisers can also qualify for membership as a Certified Assessment Evaluator (CAE), which is under the jurisdiction of the International Association of Assessing Officers in Chicago. Fee appraisers are eligible for membership in the National Association of Independent Fee Appraisers, headquartered in Arizona.

The real estate licensed appraiser has two professional affiliations open to him if he can meet the rigid requirements of the sponsoring organizations. These are membership in the American Institute of Real Estate Appraisers, an affiliate of the National Association of Real Estate Boards; and the Society of Real Estate Appraisers. Members of these professional groups are permitted to use the letters MAI and/or SRA after their names.

The real estate practitioner every day has occasion to use the practical approach to value in determining the proper market price for property listed for sale. The practical approach is the market place, that rough and tough arena in which his experience and judgment qualify him to arrive at an opinion of what people will pay.

Competence in arriving at an opinion of value is vital to the real estate practitioner. The law of agency fixes an obligation on him to the property owner, by whom he is employed. For the Realtor, there is no alternative. His Realtor's Code of Ethics requires him to inform the owner *honestly* and *intelligently* regarding the fair market value of property listed with him for sale.

All you have to offer the seller is honesty. You may arrive at your estimate of market value through application of appraisal techniques, or through a practical approach based on experience. All you know is that in your honest, well-considered opinion the property will attract a buyer, as is and as of today, at a certain price.

Knowledge and understanding of the "economic principles of valuation" give to the real estate broker and salesman the best available guide-lines in the listing and selling of real property.

Appraising is not an exact science. It is a "judgment science"—an application of checks and balances. The three approaches to an appraisal—Market Data, Cost, and Income are not used to arrive at three different values. The result of each is weighed and studied, *not averaged*, and a final opinion of value determined.

Normally, the goal of an appraisal is "market value." If you do not know market value of a property, rest assured your potential buyer is concerned with it, and usually has a rather accurate opinion of what it is. The loss of a single sale because the merchandise you are showing is overpriced may or may not be too important, but the question in the mind of the prospect as to your intelligence or integrity will do irreparable harm to your future in real estate.

In appraising a property before listing you visualize the tumult of the market place, asking, "who is going to buy it, how much will they pay for it, and how can they pay for it?".

Definitions and Terminology

An appraisal is an opinion. It is an estimate of value of an adequately described property at a specified date, supported by presentation and analysis of factual and relevant data.

Valuation is a procedure applied in estimating value.

Opinion is an exercise of experience and judgment.

Judgment is the faculty of judging wise and well, and based on facts.

The fundamental *purpose* of an appraisal is to estimate value. In preparing to make an appraisal the "why?" is first determined. Is it to learn market value, insurable value, going concern value, liquidation, or assessed value?

The *function* of an appraisal is to provide a guide for taking an action or establishing a policy, so the second step for the appraiser is to ask "what?". Is the final result to be used in connection with the transfer of ownership; for financing and credit; just compensation in condemnation; or as a basis for taxes?

Value is the relationship between a thing desired and a potential purchaser; a measure of the present worth of future rights and benefits to the typical buyer.

Objective value is created in the object itself. It is found in the cost approach where emphasis is placed on the cost of production, plus the land.

Subjective value is created in the minds of men. It is what people will pay, regardless of cost. It is found in the market data and income approaches.

Market value is the highest price estimated in terms of money which a property will bring if exposed for sale in the open market, allowing a reasonable time to find a purchaser, who buys with knowledge of all the uses to which it is adapted and for which it is capable of being used.

Cost is that which is expanded to create or acquire; cost does not necessarily equal value; cost and value are the same if construction is new, there is no depreciation, and the land is developed to its highest and best use.

Price is the amount asked, or the amount paid.

True cash value is the goal of appraisals made for ad valorem tax purposes. It is defined by Oregon statute as "true cash value of all property, real and personal, means market value as of the assessment date. True cash value in all cases shall be determined by methods and procedures in accordance with rules and regulations promulgated by the State Tax Commission. (If the property has no market value, true cash value shall be the amount of money that would justly compensate the owner for the loss of his property)".

The above definition points up the difference between the words "appraise" and "assess". Appraise means to estimate market value; assess means to fix tax value. The figures are usually different.

The real estate practitioner must always remember that PEOPLE MAKE VALUE. Land acquires value only when desired by people; normally, people will pay no more than the going price on the current market.

The mere existence of a parcel of real estate is not the reason it has a particular value. That value is related to someone willing to pay that much for the right of ownership.

Economic Principles of Valuation

The real estate broker or salesman who will make a serious effort to understand, and apply, the economic principles of real property valuation will find new success in the listing and selling of real estate.

PRINCIPLE OF ANTICIPATION

Affirms that value is created by anticipated benefits to be derived in the future. Examples are the anticipation of profit, or the satisfaction of social ambition by a home in a prestige neighborhood.

PRINCIPLE OF BALANCE

Value is created and maintained in proportion to the equilibrium in the amount and location of essential uses of real estate. Balance maintains value; imbalance destroys value. Examples: ratio of land to buildings; use of the right kind of materials; room size and arrangement.

HIGHEST AND BEST USE

That use which at the time of the appraisal is most likely to produce the greatest net return to the land and/or the building over a given period of time.

In considering "highest and best use" it must be remembered that "net return" does not necessarily mean money. The "amenities" offered by the particular property must be considered.

An "amenity" is frequently defined as a condition of agreeable living or a beneficial influence arising from the location. A house has "intrinsic value" in addition to physical features.

PRINCIPLE OF CHANGE

No material thing remains static. It is affected by the past, the present and the future. No one can predict the future, but it is the future to a large degree that establishes value. A change in the income relationship in a neighborhood, change in zoning, or an encroachment can affect values; people moving up.

PRINCIPLE OF COMPETITION

Points out that profit tends to breed competition which can dissipate all or part of the profit. Example: the success of a drug store causes another drug store to locate in the next block.

PRINCIPLE OF CONFORMITY

Holds that maximum value is realized when there is a reasonable degree of uniformity—social as well as economic.

Values tend to be higher and more stable in a neighborhood of like structures with similar uses. A house in a decreasing area gains nothing from aluminum storm windows; and an $8,000 home buyer does not expect a full tiled bath.

PRINCIPLE OF CONTRIBUTION

Affirms that the value of an item in production is measured by its net return to the enterprise. Has he spent too much to modernize? Two full baths in a two bedroom home. An elevator that will not increase income sufficiently to cover its cost. Sometimes an expenditure is made to assure continuation of present income, which otherwise would decrease.

SUPPLY AND DEMAND

Affirms the economic doctrine of scarcity, desire, and ability to purchase. Different income and social groups concentrate on property best suited to their needs and finances. They generally choose the property that fits their needs, satisfies a desire, and within reach of their pocketbook. People buy real property for one of three reasons—use and occupancy, for investment, or for speculation.

PRINCIPLE OF SUBSTITUTION

No reasonable man would pay more for a product than that for which he could buy a reasonable duplicate, allowing for no undue delay. Consider the situation of two similar properties being offered by two different sellers at different prices. One of two things will happen—the higher priced will be reduced to compete with the lower, or it will not be sold.

PRINCIPLE OF UTILITY

The ability to provide usefulness or profit. Appraisers usually consider "utility" and "desire" as one and the same thing.

PRINCIPLE OF INTEGRATION AND DISINTEGRATION

Affirms that all existence is characterized by three stages—integration, equilibrium, and disintegration. This is the life cycle of a neighborhood. Is it on the way up, holding its own, or on the way down?

SURPLUS PRODUCTIVITY

Defined as the net income remaining after the costs of labor, management and capital have been paid. The capitalization of this income tends to fix the value of the land.

INCREASING AND DECREASING RETURNS

Affirms that larger and larger amounts of the agents of production (labor, management and capital) will continue to produce a greater net return to a point.

PRINCIPLE OF REGRESSION

Maintains that the worth of better properties will be adversely affected by the presence of lesser. Evil destroys good, but good rarely lifts evil. A $10,000 home in an area of $25,000 homes will adversely affect the adjoining property. A low income group moving in will lower value.

Forces in Real Property Valuation

In recent years the appraiser has come to recognize that the accuracy of his opinion of market value of a particular property is tied directly to the extent of his knowledge of three great forces in real estate.

These forces are Social, Economic and Political. The movement of these forces can be followed by "trends", which are defined as a series of related events. Recognition of these trends will influence the appraiser in his valuation process.

Trends under the Social force include population growth and decline, shifts in population density, mobility, personal instincts and desires.

Some sets of trends influenced by the Economic force are natural resources, commercial and industrial tracts, availability of money and credit, employment and wage levels, interest rates, tax burden, purchasing power.

Trends directed by the Political force include zoning, building codes, police and fire regulations, rent controls, national defense, allocation and credit controls, government housing, guaranteed loans.

Analyzing the Neighborhood

The final estimate of value of a particular property will attach to the physical property, but because "value is in the minds of men" the final conclusion of value will have been strongly influenced by things outside the physical.

We have already considered the great forces that influence the neighborhood. In studying the neighborhood consider the following:

PHYSICAL—Streets, transportation, schools, stores, parks, churches, climate, utilities.

SOCIAL—Social and economic homogeneity, prestige, attitude toward law, family size and age.

ECONOMIC—Thrift, income, vacancy rate, attitude of lenders, changing use.

GOVERNMENTAL—Tax burden, zoning, assessments.

Site Analysis

In the analysis of the site we generally are not seeking to value the land, but to determine its contribution to the valuation of the entire property.

Facts to consider in analyzing a site are:

Is it employed to its highest and best use?

The title and public record data: Are there public or private restrictions?

Physical data: Topography, frontage, depth, shape, utilities, landscape.

Relation to land pattern: Corner, climatic (light and air), advertising advantage, street width, curbs, traffic load.

Some of the amenities attached to a site are whether it is a name location, its spaciousness, location of schools and parks.

If your chore is the valuation of the land, the very best method is by comparison with similar properties (the Market Data approach).

Land should always be valued to its highest and best use. If a building on the land is no asset the demolition cost should be deducted. The ad valorem tax values land and buildings separately, and the law permits no depreciation of land for tax purposes.

Styles and Functional Utility

In an analysis of the improvements first attention is given to the architecture and functional utility.

Is the architecture related to the site? What is its relative marketability?

Functional utility is defined as the sum of the property's attractiveness and usefulness. How about the planning? No waste space? A large living room, small efficient kitchen, adequate dining area, one large or master bedroom, linen closet, medicine closet, attic storage?

Consider whether the property is a so-called "competition house" or one with gimmicks that add nothing to utility. The "competition house" loses value by thin butt shingles on the roof, non-miter corners on door and window casings, two door hinges where there should be three, no sub-floor, cheap electric fixtures.

The property will be desirable to the degree it will serve its occupants. Fads and personal nicknacks are not enjoyed by all persons to the same degree or at the same time.

It is in your inspection of the property that you will apply many of your economic principles of valuation. Does it conform? Has the principle of balance been adhered to in room size and arrangement?

Construction Survey

An understanding of local conditions of climate, sources of materials, popularity of planning, types

and variations in equipment is necessary in forming an opinion on construction.

A check list for a construction survey should direct your attention to the foundation, frame, termite damage, exterior wall, floors, interior walls, doors, windows, hardware, roof, fireplace, chimneys and flues, gutters and downspouts, mechanical equipment, heating system, plumbing, electric wiring.

Building Costs Estimates

An accurate, but costly and time consuming, method of estimating cost of a building is known as the "quantity survey." The kind and amount of every material used is tabulated and the total cost of each item is added to labor and overhead to arrive at your estimate.

Another method is known as "unit in place" in which the installed prices of units of construction are estimated on a square foot basis.

Best method is the "comparative" in which you compare the subject property on a square foot or cubic foot basis with similar buildings whose cost is known to you.

Because cost and value are so seldom related, the average real estate practitioner will rarely be concerned with costs of a property.

It is well to know, however, that costs are both direct and indirect.

Direct costs are the costs of materials delivered on the job and the cost of labor to assemble the materials into the finished structure.

Indirect costs are the contractor's overhead and profit, and the general overhead, such as architect and legal fees, taxes, insurance, administrative expense, and interest during construction.

Direct costs attributable to land are the price of the land, title examination, recording fees, and legal fees.

Depreciation

The MAI definition of "depreciation" is "depreciation always has been, is now, and probably always will be a loss of value from all causes, but modern thinking says it is the difference between the reproduction cost new and the present value."

There are three types of depreciation:

PHYSICAL: A loss of value from all causes of age and action of the elements.

FUNCTIONAL: A loss of value from all causes within the building. These could include structural or something such as four bedrooms with a single bathroom.

ECONOMIC: A loss of value from all causes outside the property. Anything present that violates the principle of balance, such as an over or under improvement, close to a nuisance, or some government regulation.

Expressing depreciation in dollars is better than percentage. A $10,000 property 50% depreciated has a depreciation of $5,000. A 60% depreciation would be $6,000. The difference between the percent figures is 10%, while the difference in the dollar amounts is 20%, a possible source of confusion.

The depreciation in real property is normally very slow, and an almost unbroken trend of social, economic, and political tensions have tended to wipe out this natural wearing away of value. The almost unbroken phenomena of many years of profit in the resale of real estate has practically eliminated any idea of the "cost of enjoyment" from the minds of owners. But, depreciation is there, regardless of the great external forces, and if you are to be successful you must be able to support your determination of realistic value with facts and logic.

In expressing an opinion of value you are simply carrying out one of the important phases of the daily task of making a living. Under our commission system we could make more money if buyers would buy at the prices asked by eager sellers.

Market Data Approach

Of the three techniques employed in the appraisal process, the Market Data approach is the most common, most easily understood by people, given the greatest weight by courts, is one of the oldest, and is solidly based on the truism that "value is in the minds of men."

It is the technique employed daily by the real estate practitioner. It is well to remember that the mechanics of this technique, the use of comparables, is also basic in both the Cost and Income approaches to value.

Experience comes from working in the hustle-bustle of the market place, while knowledge comes in the quiet of the study.

In testing the market we must think as the average buyer thinks, and look at a property through the eyes of the average buyer. The mere fact that a friend sold a similar property at a pleasing profit is not reason enough to overprice a particular property. The friend may have sold to a father who bought the property for a daughter, thus assuring himself that his grandchildren would be nearby.

Market value is not determined by "similar" properties, but by "comparable" properties. As we have seen, many things outside the structure and outside the lot lines must be considered in selecting comparables. It is well to remember that market data must include the effect of the down payment. The market may give you an opinion of value, but the price will have been influenced by the terms of the sale.

THE PROCESS

The market data approach is a process of making comparisons, and is very accurately described as "the use of the judgment factor."

Before attempting to arrive at a conclusion of value of any parcel of real estate the broker should have supplied his office with check lists and some form of rating grids, similar to those shown in this section.

Comparisons must be made with prices paid for similar properties, prices now asked by owners, offers made by interested purchasers, willing and able to buy, rentals and leases, like utility, comparable location, time required to sell. At the same time an analy-

sis should be made of the social and economic factors affecting the marketability of the subject property.

The comparisons are made under four general headings—price, date sold, location, and physical characteristics. When you offer an estimate of market value of a particular property, a well documented record of sales of comparable properties makes your opinion convincing.

A single sale of a comparable property will rarely give sufficient data for an opinion of value. If possible, a minimum of four sales should be used for comparison. As no two properties are exactly alike an adjustment must be made for differences.

It is well known that the motive that prompts a sale has a bearing on the selling price. Discover, if you can, what stimulated the sale. Perhaps a threat of foreclosure, gift to a relative, need of expansion, a tax advantage. Are the buyer and seller informed people? Are they typical?

A group of brokers and salesmen interested in acquiring a particular property requested an estimate of its market value from a committee of their own members.

The subject property was a residence of English type architecture, built in 1926 on a 50′ x 100′ lot, and containing 1060 square feet of living area.

The FHA had made a conditional commitment of $13,950. An inspection of the property itself seemed to indicate that the commitment was in line with current market value.

The committee then set about its important task of comparing. A similar property directly across the street, sometime before appraised at $12,500, had sold six months ago for $10,500. A residence in the neighborhood, listed for $10,750, had sold on contract for $9,500 with a $700 down payment. Another similar property sold three years ago for $12,500, but recently re-sold for $8,500. Three lots in the area had once been appraised for $12,700, but were now offered for $10,500.

A check at the tax collector's office showed the last tax bill against the subject property to have been $240.30. The tax was based on the assessor's market value of $9,200.

After an analysis of this data and neighborhood data, the committee concluded that social and economic forces, and the life cycle experienced by every neighborhood were sharply changing [illegible]. The committee's estimate of market value of [illegible] subject property was $11,500.

In this actual appraisal of a subject property the appraisers use as comparables listings, offers to sell, and actual sales.

Listings tend to set the ceiling of market price. The number of listings in a particular area is a good indicator of a trend. Offers to purchase tend to set the floor of market price.

Too much emphasis can not be placed on the importance of using a check list and a rating grid in making comparisons of similar properties. A "property record" file, if carefully worked at, can become your own "appraisal laboratory." Into the file should go all the information you can get, see or hear about properties in your area. The information from this file, with the courthouse records and your own field work, will make your job easier and the end result more accurate. The file should list the properties by street number and street name, show sales and listing prices, time to sell, conditions of sale, etc.

If it is necessary to go outside the neighborhood of the subject property for a comparison make adjustments for differences in neighborhood and inhabitants, transportation, schools, parks, playgrounds, traffic hazards, nearby shopping.

Samples of rating grids, adjustment grids, and comparison grids are shown in this section. In each you determine whether the subject property is equal, superior, or inferior to the comparable. Although rating is usually done on a percentage basis, the final adjustment should be expressed in dollars. People understand dollars.

Verification of comparable sales should be made through the title company.

It is not anticipated, nor intended, that this appraisal discussion will, by itself, qualify the reader as a professional appraiser. The material presented here is intended to be of assistance to the real estate practitioner in his day by day routine.

The Market Data approach will be the technique used most frequently by real estate brokers and salesmen to arrive at an honest estimate of market value in the listing and selling of real property.

The Cost and Income approaches will be discussed only briefly. Attendance at classes offered by the American Institute of Real Estate Appraisers and the Society of Real Estate Appraisers for the individual interested in advanced or professional training in appraising is highly recommended.

Cost Approach

Use of the Cost approach to arrive at an opinion of market value requires a higher degree of training and experience than does the Market Data. Because of the ease of error in estimating depreciation this approach is used more frequently in estimating value of a newly constructed property.

THE PROCESS

There are six steps to the Cost approach.
They are:

1. Estimate land value.
2. Estimate reproduction cost new today.
3. Estimate depreciation (physical, functional, economic).
4. Deduct depreciation from building cost.
5. Add value of land to result of No. 4.
6. Result—indicated value of building and land today.

In the above process we used the word "reproduction" cost. Reproduction cost new is generally accepted as meaning the cost that would be incurred if the property was reproduced as an exact replica. To do this might well involve materials and construction practices not practical to apply today. Unless the appraisal is being made to determine insurance value, the second step should be to estimate "replacement" cost, which would be the cost of replacing the building with one of the same utility and amenities.

Since people ordinarily will not pay more for a property than it would cost to replace within a reason-

able time (principle of substitution), the Cost approach tends to set the upper limit of value.

METHOD

The estimated land value is obtained by comparison with similar properties. It is always market value of the land, considered as vacant and available for improvement to its highest and best use. The "cost" of the land is *not* its market value.

The building cost new today is usually obtained by one of three methods:

1. Quantity survey method: the kind and amount of everything in the structure, including both labor and materials is priced.
2. Unit in place method: how much to put in a square foot of floor, wall, roof, etc.
3. Comparison: obtain the square foot or cubic foot building costs from a local contractor for similar structures.

The comparison method is the easiest and fastest. It requires no technical construction knowledge, but it is not as accurate as the other methods.

Treatment of Depreciation

In arriving at an opinion of value via the Cost approach, the appraiser must carefully consider each of the three types of depreciation, namely, physical, functional, and economic. These were defined earlier in this section.

Depreciation can best be estimated by personal inspection and comparisons of the subject property with a hypothetically new or 100% property. This is known as the "observed condition method" and is given the greatest weight by the courts.

The most commonly used method is "straight-line" depreciation. In this method depreciation estimates are tied to a fixed rate applied to the age of the structure, such as 2% per year. While widely used, there is little justification in assuming that improvements depreciate at a rate corresponding to their age.

While the application of the Cost approach is not a simple task, it is essential on complicated, single purpose, and industrial properties.

Before leaving the Cost approach, attention of licensees interested in appraising should be called to the book, Cost Factors for Residential Buildings, which is available at reasonable cost from the State Tax Commission.

The book is designed to aid rapid application of the Cost approach to estimate current market value in mass appraisal projects. It can be of help to the licensee in general brokerage.

Income Approach

The Income approach is concerned with the definition "Value of a property is the present worth of the net income it will produce during the remainder of its productive life."

The Income approach teaches that rent measures value because it measures the intensity of the desire of the prospective user of the property; and that there is always a fixed relationship between rents paid in a neighborhood and the prices at which properties are selling.

The Income approach is particularly important in the valuation of income-producing property, but almost invariably the careful appraiser will use the other two approaches to value as a check on this single technique.

This approach is usually based on the use of the "net" income because the properties thus appraised are purchased for money income or for investment. In the appraisal of one or two family residential properties an appraisal tool, the "gross rent multiplier" is frequently used.

GROSS RENT MULTIPLIER

The "gross rent multiplier" expresses a relationship between the gross monthly rent and the estimated market value of a property.

This must not be confused with another well-known rule of thumb, which proclaims that the monthly rent multiplied by 100 equals value.

To get the gross rent multiplier the appraiser selects properties that are comparable to the subject property. He then divides the known sales price of the comparable property by its gross monthly rent to get the monthly gross rent multiplier. The gross rent multiplier can then be multiplied by the gross rent of similar or comparable properties to arrive at an estimate of market value. In many areas assessors are making use of the gross rent multiplier for taxation purposes.

AN EXAMPLE:

The appraiser finds a comparable property now rented for $150 a month, and which recently sold for $24,000. He divides $24,000 by $150 and arrives at a gross rent multiplier of 160. The subject property has a monthly rental income of $175 a month. He then multiplies $175 by 160 and estimates the value of the subject property to be $28,000.

In the above example we could have capitalized the gross annual rent to arrive at an indication of value, but this is seldom done.

If our potential buyer expected a return of 5½% on the gross rent we could select a rate to recapture his investment over a period of 50 years. This rate would be 2%. Adding the two together we have a capitalization rate of 7½%.

The income of $175 per month amounts to $2,100 a year. Dividing $2,100 by the capitalization rate of .075 we would get an estimated value of $28,000.

A "gross income multiplier" can be used with annual income in a similar manner. The comparable property sold for $24,000 and had an annual income of $1,800. Dividing $24,000 by $1,800 we get a gross income multiplier of 13.3. Multiplying the $2,100 annual income of the subject property gives us an estimated value of $27,930, which would be rounded to $28,000.

CAPITALIZATION PROCESS

As already stated, in the normal Income approach the appraiser works with "net" income. Actually, he begins with "effective gross income." This figure is obtained by deducting from the "gross" income of the

property an estimate of vacancy and credit losses. In arriving at the "gross income" he used the "economic rent", which is what the facility would bring on the open market today if 100% occupied.

From effective gross income he deducts fixed expenses, such as taxes and insurance; actual operating expenses and repairs; a reserve for replacements, such as short-lived items of equipment; and other expenses, such as mortgage interest, income tax, or depreciation reserves. He now has "net income."

His next step is the most difficult and requires a high degree of training and experience. This is the selection of the "capitalization rate." This rate is the sum of an interest rate and rate to recapture capital. The investor wants a return "on" his investment and a return "of" his investment.

The appraiser must go to the market place to find the interest rate that will attract an investor. What interest do investors demand from a "safe" investment, such as government or utility bonds? What penalty do they demand for the "risk" in real property? The sum of the two will be the interest rate.

The next step is to find the recapture rate, which is the rate that will return the investment, including depreciation over a period of years. The sum of the interest rate and recapture rate becomes the Capitalization Rate.

When the net income and the capitalization rate have been determined the final step is to capitalize the income.

This can be a simple mathematical calculation as shown below if the income is considered to be a perpetuity, or a more involved use of formulaes and annuity tables.

In the advanced use of the Income approach there are three techniques of capitalization. They are "land residual", "building residual" and "property residual." Four methods of capitalization are "straight line", "annuity", "sinking fund" and "increasing and declining annuity."

As an example of a simple mathematical calculation of value via the Income approach consider the same property we discussed in the use of a gross rent multiplier.

In this case the appraiser determined the "net" income to be $125 a month, or $1,500 a year. He learned that investors would demand a capitalization rate of 8% on such an investment. He then divides .08 into $1,500 and arrives at an estimate of value of $18,750 for the property valued at $28,000 via the use of a gross rent multiplier.

The valuation arrived at in the above example was reached by charging $600 in expense items against the gross income, reducing net income to $1,500. This demonstrates the importance of arriving at accurate gross income and expense estimates.

It is well to point out that if he had determined the proper capitalization rate to have been 8½% his final estimate of value via this approach would have been approximately $17,645. Thus, the more risk the less an income stream is worth and the higher the interest rate.

Careful selection of the capitalization rate is the secret of the Income approach. As already stated, gross income is used as the starting point in residential properties, and net income is used for strictly income or investment properties.

As the property used in the above examples was a residential property the appraiser would have used the gross income, and had he arrived at a capitalization rate of 7½% he would have reported an indicated value of $28,000, the same as that via the gross rent multiplier. Although other methods are used to arrive at the safe and risk components of the capitalization rate, the most reliable source is the market place.

The capitalization rate then depends upon the return investors will demand for an investment in such a risk. This rate must take into consideration the return *of* the invested capital and a return *on* the investment.

When thinking of capitalization rates, remember the equation:

Income divided by rate equals value:

$I \div R = V$; or $I \div V = R$; or $V \times R = I$. It may be easier to keep a picture in your mind, such as

Both are expressions of an algebraic equation, if any two of the parts are known the third can be determined.

From the formula, it is evident that "capitalization" is the process of arriving at the value of a property through the use of a rate. The rate is believed to represent the proper relationship between the real property and the net income it produces.

The rate is obtained from the market. What does the typical investor expect from such an investment compared to that from other sources seeking capital?

SUMMARY

What, briefly, are the good and bad features of each approach?

Market Data—Good: One of the oldest, its mechanics are used in all approaches, best on residential property, easiest to understand, accepted by people, accepted by courts. Bad: No two properties are identical, adequate data not always available, retrospective in character.

Cost—Good: The oldest, popular with buyers, ascertains location, time and reason for depreciation, accepted by most courts, can be an accurate indication of value. Bad: Costs never estimated exactly, chance of error in depreciation, some buyers do not depend upon it, requires time and considerable skill.

Income—Good: Excellent check on conclusions of other approaches, one of best on land with no improvements, desired by large investors, may be only guide available. Bad: Everything is an estimate, accurate data difficult to collect, not understood by small investors, courts and juries.

FINANCING

Research into the field of finance and the implement of barter indicates that had it not been for man's discovery of metal we might today buy or lease real property by exchanging an indeterminate number of cows for the right to possession and enjoyment of the real estate.

According to historians, coins were first used about 700 B.C., and paper money came into being during the 14th century. Whether we barter in butter, coins or paper money, real property transfers today are seldom for cash.

A very high percentage of all real estate transactions require financing, extending over a period of years. Real estate brokers and salesmen can gauge their hopes of success by the extent of their knowledge of the sources of financing and the requirements of the individual lenders.

Prior to the 1934 National Housing Act, mortgage loans were quite generally short term, non-amortizing, and bearing high interest rates.

Low ratios of loan-to-value led to a considerable volume of junior financing, while the lack of a system for checking tax records resulted in many tax delinquencies. Lending practices were characterized by an inadequate credit analysis and inadequate construction requirements.

The National Housing Act and the Servicemen's Readjustment Act of 1944 contributed much to better lending policies and practices.

Real estate loans are generally classified as residential, residential income, commercial, shopping center, industrial, office buildings, lease and leasehold, tract and subdivision, and special purpose.

The rank in volume of non-farm mortgages of non-government lenders is probably in the following order: Savings and loan associations, life insurance companies, commercial banks, mutual banks, mortgage bankers, individuals, pension funds, colleges and universities, credit unions, cemetery endowment funds, trusts, etc.

TYPICAL TYPES OF LENDING

Each of the various types of lending institutions follows a lending policy quite general to its class. These are:

Savings and Loan Associations—Single family residences, substantial amounts of construction lending, relatively high loan-to-value ratios, slightly higher rates than other institutions, medium maturities, properties located relatively close to association.

Life Insurance Companies—Long-term lending, large size loans or packets of loans, considerable amount of commercial and industrial lending, few construction loans, loans on property leased by large concerns, many loans through correspondents.

Commercial Banks—Short-term lending, considerable number of small size loans, large number of highly liquid loans, properties located relatively close to bank, loans associated with relationships with customers, considerable amount of interim lending.

Mutual Savings Banks—Predominantly residential lending, properties near bank if conventional loan, if property is distant from bank loan is FHA or VA, or handled through correspondent, small size loans.

MORTGAGE BANKERS

The mortgage banker is playing a constantly increasing role of importance in real property financing.

As a correspondent for the large institutional lender, the mortgage banker is constantly on the alert for suitable outlets for the funds of his principal. It is his task to do the preliminary processing of the loan applications, submit them to his principal, and service the completed mortgage.

Most mortgage bankers perform a general real estate brokerage business in addition to their lending activities. Most also represent themselves or other individuals in providing real estate financing. In such cases they close the loan and then sell the instrument to the permanent lender.

Mortgage bankers are a major source of construction loans.

BROKER'S PLACE IN FINANCING

Good business practice places a duty upon the real estate practitioner to render assistance to a client in arranging for his financing.

To minimize the time of processing, to avoid embarrassment and the disappointment of a prospective applicant for a loan the real estate practitioner must keep his knowledge of local lending policies up-to-date.

He must remember that the lender of today will look both to the property as collateral and to the repayment potential of the borrower. The three "C's" of credit pretty generally govern a lender's decision: "Capital, capacity, and character."

The broker should be familiar with the sources, and mechanics of each source in approving a loan.

He should be familiar with the basic contents of each form of application. He can help by a preliminary screening of the applicant, by advising the applicant as to justifiable amounts and terms to request, by clarifying for the applicant the technical aspects of the application, by advising his client as to the desirable amounts of supplemental information to include, by checking the application for accuracy and adequacy, and by aiding in the presentation of the application to the lender.

It was recently pointed out that while FHA will insure a loan made to a person whose liabilities were removed by bankruptcy, few lending institutions will make the loan.

A knowledge of lending policies and practices plays a major role in the success of the real estate brokerage business because of the importance of credit in making transfer of title possible.

The commodity sold by the broker is actually the equity of the seller, or to explain it another way, selling real estate is usually selling down payment and terms of credit.

Brokers and salesmen must know the source of credit and be able to expedite loan placement. In the money market they must be flexible—seek and have many sources and arrangements.

RULES OF THUMB

While "rules of thumb" are nothing more than uncertain guide lines, some reliance can be placed on them in estimating the credit capacity of an individual. A couple of these are "a new home should cost no more than 2 to 3 times the annual income", or "housing costs should not be greater than 20 to 25 per cent of 'effective income' ", which is explained in the FHA section of this Manual.

QUALITIES OF A GOOD INVESTMENT

1. Safety
2. Certainty of yield
3. Liquidity (saleable in the market)
4. Acceptable denominations (of a size typical investor can handle)
5. Value as collateral (can it be used as security for a loan)
6. Acceptable duration (some want long term, other short)
7. Freedom of care (people do not want to manage their investments)
8. Potential appreciation (will it be a hedge against a change in purchasing power)

JUNIOR MORTGAGE

A junior mortgage is one subordinate to the claims of the first mortgage. The first mortgage has first lien on the property revenues, and once foreclosed wipes out the claims of the junior mortgage holder against the property. Foreclosure of the second mortgage does not disturb the position of the prior mortgage holder.

When used the second mortgage commands a higher interest rate because of the greater risk. If it can be sold the second mortgage has a high discount rate. Use of the second mortgage has largely been replaced by the land contract, which permits a low down payment when a buyer is unable to qualify for other financing.

If a second mortgage is used it is usually taken back by the seller, because neither party is in a position to add the amount to a new first mortgage. Second mortgage funds come from private sources, and are usually drawn for a five year period.

Bank Real Estate Loans

National banks and state banks are permitted to make real estate loans on improved property, such as residential, farm, commercial, and industrial.

Laws governing national bank real estate loans are regulated by the congress of the United States, while real estate loans made by the state banks are regulated by our state legislature. Usually these laws are identical.

National banks and state banks are permitted to make what they term conventional real estate loans as follows:

Type	*Term*	*Payments*	*% to Appraised Value*
Conventional			
Residential	Up to 25 years.	In amount sufficient to amortize loan over the loan period.	80% of bank appraisal.
Farm	Up to 25 years.	In amount sufficient to amortize loan over the loan period.	80% of bank appraisal.
Commercial	Up to 25 years.	In amount sufficient to amortize loan over the loan period.	80% of bank appraisal.
Industrial	Up to 25 years.	In amount sufficient to amortize loan over the loan period.	80% of bank appraisal.
Improved public parking lots	Up to 25 years.	In amount sufficient to amortize loan over the loan period.	80% of bank appraisal.

The Federal Housing Administration value and maximum mortgage amounts for one and two family residences are as follows:

Type	*Term*	*Payments*	*% to Appraised Value*
FHA (Federal Housing Administration)	Up to 40 years.	In amounts sufficient to amortize loan over the loan period.	In accordance with FHA regulations.

The down payment on Federal Housing Administration loans depends on the size of the loan, and the age of the house that is being purchased.

At the time the Primer went to press, Congress was moving favorably on legislation to permit national banks to make fully amortized conventional mortgage loans with a loan to value ratio of 90% for terms of 30 years.

8101

Savings and Loan Associations

1. Savings and loan associations are the largest single source of residential mortgage financing. Nationally, the savings and loan associations account for approximately 45 percent of all non-farm mortgage recordings.
2. These associations are specifically chartered under the laws of the State of Oregon or the laws of the United States. Those chartered under the laws of Oregon are supervised by the State Savings and Loan Supervisor and in conjunction with supervision under the direction of the Federal Home Loan Bank Board. The associations chartered under the laws of the United States are supervised by the Federal Home Loan Bank Board of Washington, D. C.
3. The charter of the associations under state supervision provide that "they are to encourage thrift, industry, frugality and home building", and those chartered under the federal law are organized to "promote thrift and home ownership". Each association is a separate entity and is locally operated. Branch offices are under the jurisdiction of the home office of the parent organization.
4. On the side of thrift, savings and loan associations accept savings accounts and savings certificates from individuals, partnerships and corporations and pay interest earnings either semi-annually or quarterly on such accounts. Most state

chartered associations are members of the Federal Home Loan Bank System and of the Federal Savings and Loan Insurance Corporation. All Federally chartered associations are members of the two organizations. The Federal Savings and Loan Insurance Corporation insures the saver in all institutions under its system against loss of savings up to $20,000. Historically, savings and loan associations have paid a somewhat higher return to the investor or saver than do other financial institutions.

5. Most of the investments of savings and loan associations have to be confined to first mortgage loans upon improved real property, although they do have additional authority to invest in state and municipal bonds.

6. Both State and Federal savings and loan associations must live within the same framework and abide by the same regulations if they are to qualify as a "Domestic Savings and Loan Association". These regulations require that most loans must be made on 1 to 4 family dwellings, with loans also permitted on commercial property and apartments. Commercial and apartment loans cannot exceed 36% of total loans for any association. Further, not more than 18% can be represented by commercial loans. In practice most associations carry from 70% to 85% of all loans in residential properties. These provisions make savings and loan associations the only supervised lender whose operations are concentrated in the residential field.

7. There are 32 Oregon savings and loan associations, and two

out-of-state associations have branches in the state. There are 18 Federally chartered and 14 State chartered associations. Total Oregon savings and loan associations' mortgage loans outstanding December 31, 1969, exceeded $1 billion 400 million. The 32 associations, either by home office or by branches, now have offices in most of the cities of Oregon and can provide residential financing for most of the outlying areas.

LOAN RATIO

8. The rules and regulations under which Federal associations operate provide ability to grant conventional loans to 80 percent of association's appraised value, (under certain circumstances 90 percent), and any loan approved by the Federal Housing Administration or the Federal Veterans' Administration.

Rules covering the making of 90 percent loans were liberalized in 1967, permitting 90 percent conventional mortgage loans up to $31,500. This means a top purchase price for a home (or a combination of home and business property) of $35,000. This applies to both new and existing homes.

9. State chartered associations have the authority to grant up to 80 percent of appraised value on an installment mortgage loan or a 66 2/3 percent straight loan. In making loans in excess of 80 percent, but not to exceed 90 percent, state associations must establish either an excess reserve account amounting to 10 percent of the balance due on all excess reserve loans or

the 10 percent excess must be guaranteed by mortgage guaranty insurance.

10. The rules for Federal associations will also permit an association to lend a relatively small percentage of their total loans outstanding on apartments and commercial property.

11. In general, most of the loans made by the savings and loan associations are "conventional loans", that is, loans made without any government insurance or guarantee, such as Federal Housing Administration insurance, or the guaranteed Veterans' Administration loans.

12. While savings and loan associations are permitted to make the insured or guaranteed loan, only about 8 percent of Oregon Associations; outstanding loans are in this field. Actually, throughout the nation, less than 30 percent of all mortgages recorded are either FHA insured or VA guaranteed.

13. While lending rates and lending percentages may vary from association to association, and from time to time as the money market fluctuates, the savings and loan associations, as local lenders on residential real property, are always able to make a mortgage commitment to a good purchaser on a good residence.

14. Briefly speaking, the business of savings and loan associations is confined to two avenues: one, receiving of savings of people in order to, two, loan out money to deserving people who desire to build, purchase or remodel a home.

FEDERAL HOUSING ADMINISTRATION

The Federal Housing Administration has been in business since 1934. It was established under the provisions of the National Housing Act approved June 27, 1934, and now functions as a part of the Department of Housing and Urban Development.

The preamble to the National Housing Act states that the purpose of the Act is "to encourage improvement in housing standards and conditions, to provide a system of mutual mortgage insurance, and for other purposes". The FHA operates under authority of Titles I, II, VII, VIII, IX, X, and XI of the Act. These titles provide for FHA insurance against loss on loans for alterations, repairs, and improvements to homes and other real property; insurance of mortgages on homes; insurance of mortgages on multifamily rental projects; insurance of loans for land development and new communities; and insurance of group practice facilities.

The FHA works in cooperation with private industry to make better housing available to the American people. About 40 million families have benefited through FHA-insured loans.

Through the insurance programs of the FHA, the average family is enabled to finance homes on reasonable terms.

Owners of homes and other properties can borrow money needed for repairs and improvements. Cooperative and condominium groups can take advantage of the economies and other benefits of housing acquired through joint effort. Families in urban renewal areas can improve their housing conditions, and those providing facilities for housing of senior citizens, for mobile courts, and for nursing homes may qualify for desirable financing with FHA mortgage insurance. The supply of other multifamily housing at reasonable rents is increased, and essential housing for the Armed Forces is provided. The construction of group practice facilities is also encouraged. These facilities can be used for the practice of medicine, optometry, or dentistry.

The FHA operates without cost to taxpayers except for the rent supplement and payment subsidy programs. Its income from fees, premiums, and interest on investments has been sufficient to pay its operating costs, insurance losses, and related expenses, and to build up substantial reserves.

The mutual mortgage insurance system, with provision for minimum property standards, low down payments, and amortization of the debt by monthly payments suited to the borrower's income grew out of recognition of the need for a sound method of home financing. It has brought home ownership within the reach of many families who could not otherwise afford it, and at the same time has helped industry to maintain a high level of home construction.

Besides playing an influential part in the revision of mortgage lending practices, the mutual mortgage insurance system has other accomplishments to its credit. By providing a standardized mortgage instrument, it has made possible the purchase and sa[redacted]ured mortgages on a [redacted]ional scale. It has

also contributed materially to improvement in housing standards through the establishment of minimum property standards, careful architectural analysis, construction inspection, and the establishment of methods of planning and developing subdivisions. Moreover, FHA analysis of local housing markets has helped to avert overbuilding in specific areas and price ranges.

Another activity that is extremely important to the success of the FHA's mortgage insurance business is the study and evaluation of new materials, new combinations of old materials, and new or improved methods of construction and land development. FHA cannot sanction experimentation with the homeowner's money by accepting unproved materials or methods. On the other hand, it does not want to block progress by rejecting products or ideas only because they are too new to reflect long experience. The technical studies program, set up by FHA, provides a procedure for identifying, analyzing, and studying construction and materials problems without duplicating research work performed by others, and involves the assistance of industry, Government agencies, educational institutions, and various research organizations in solving these problems.

FHA insures lenders against loss in connection with more than 25 different segments of the various titles. Title I of the Act authorizes the FHA to insure lending institutions against loss on loans made to finance alterations, repairs, and improvements to existing structures and the building of new structures for non-residential use. About 20 billion dollars have been advanced to property owners under the Title I program. FHA liability is limited to 90 percent of the loss on an individual loan and to 10 percent of the total amount of Title I loans made by the institution. The loans are made, without FHA processing, by approved lending institutions to borrowers with satisfactory incomes and credit records. The borrower must have a fee title or life estate interest in the property, or a lease expiring not less than six months beyond the maturity of the loan, or be purchasing the property on contract.

A loan to improve a single-family home, or to build a new non-residential, non-agricultural structure may be in any amount up to $5,000. It may be repaid in equal monthly installments over a period from six months up to seven years. A loan to repair or convert a multifamily structure which is not owned by a corporation may be as much as $15,000, or an average of $2,500 per family unit, whichever is less, and may have a maturity up to seven years. A loan to build a new structure for agricultural use may be as much as $5,000 and may be repaid over a period of seven years or up to 15 years if the loan is secured by a first lien. A loan of $5,000, repayable in seven years, may be had to build a new commercial structure. FHA may insure loans, up to the maximum amount of $10,000, to be repaid in 12 years and 32 days, financing the retail sale of mobile home units.

Under the Title I program, loans are usually personal type rather than loans where collateral is pledged. FHA specifies the broad lending policies used by lenders in processing and making improvement loans.

Pursuant to the requirements of prudent business practice and the legal requirements of the National Housing Act, and in the interests of impartiality, uniformity, and consistency, the Federal Housing Administration has formulated a system of mortgage risk rating. A mortgage risk rating is the act of analyzing the elements which produce mortgage risk and ascribing a rating, based on the risk characteristics of individual mortgages. The purpose of the system is to determine whether or not a particular mortgage transaction has a reasonable promise of success. The rating thus derived, in the FHA risk-rating system, is called Rating of Mortgagor.

One of the requirements dealing with the insurance of mortgages under Section 203(b), which is the principal activity of FHA, is that "no mortgage shall be accepted for insurance under this section unless the Commissioner finds that the project with respect to which the mortgage is executed is economically sound". Economic soundness is lacking if the mortgagor is not an acceptable credit risk, even though the property is adequate security for the mortgage and, contrawise, it is lacking if the mortgagor is an acceptable credit risk but the property is not adequate security for the loan. Loss to the mortgagee can occur only in the event the mortgagor is unable or unwilling to meet his obligations to the mortgagee and the mortgaged property cannot be sold in a reasonable time for an amount sufficient to discharge the mortgagor's total obligation under the mortgage, including the expenses and carrying charges incurred by the mortgagee up to the date of the sale. Obviously, then, the aim of mortgage lending policy and practice should be to avoid, if possible, recourse to forcing a sale of the mortgaged property in order to satisfy the debt of a defaulted mortgagor. Since this contingency can occur only upon default by the mortgagor, good practice and economic soundness demand not only that the mortgagor be an acceptable credit risk but also that the mortgaged property be adequate security for the loan. Therefore, the degree if risk characterizing any mortgage loan depends upon relationships between the present and prospective characteristics of the borrower and property and the amount and term of the loan.

The FHA risk-rating system provides a method by which the economic soundness of any particular mortgage transaction can be rated by analyzing its relative degree of risk. Analysis in mortgage credit leads to a conclusion as to the borrower's past, present, and probable future willingness and ability to meet his obligations. Analysis of the real estate elements, which relate to the property and its location, leads to conclusions as to the value of the property at the time of the mortgage transaction and as to the probable future marketability of the property should its sale become necessary to discharge the outstanding obligation of the borrower to the mortgagee. The third group of elements analyzed are the amount, repayment plan, and term of the loan.

8108

The FHA risk-rating system is not a formula. It is a guide to judgment which is intended to bring about a maximum possible degree of accuracy and consistency in evaluating risk in mortgage transactions.

The architectural analysis relates to the building improvements of a property submitted for mortgage insurance. This analysis is made to determine the eligibility and acceptability of the physical security for insurance. It also provides conclusions essential to the determination of the value of the real estate through analysis of the physical elements of the property from the viewpoint of its quality as mortgage security. Inspections of construction are made by FHA in its own interest in order to determine whether construction of the physical security for the mortgage to be insured is in acceptable compliance with the terms of the insurance commitment and sound construction practices.

In the FHA system valuation estimates are required to assist in making decisions with respect to the eligibility of loans for mortgage insurance. A percentage of the estimate of value establishes:

(a) The maximum amount beyond which the National Housing Act does not permit a loan to be insured.

(b) The minimum amount of cash investment required of the mortgagor; and

(c) The ratio of loan to value used in risk rating.

Valuation estimates are used in FHA's mortgage insurance operations to disclose the capability of the property to secure the loan. There are two ways in which real properties constitute security for a mortgage. The first is the borrower's desire to retain ownership of a property because of the future usefulness and benefits to be derived. The second is the amount obtainable at a sale if the mortgage is foreclosed and the property sold.

The word "value" is defined as: "The price which typical buyers would be warranted in paying for the property for long-term use or investment, if they were well informed, acted intelligently, voluntarily, and without necessity." The National Housing Act requires that the value FHA ascribes to a property be made known to any purchaser who will use FHA mortgage insurance to finance the purchase. Where FHA value was not furnished the purchaser prior to the signing of an agreement to purchase, such agreements must be amended to place the purchaser in the same position he was in prior to entering into the agreement.

Analysis of value includes not only the physical improvements but also the manner in which value is affected by reason of its location. Further steps in the valuation analysis include an estimate of replacement cost of the property, estimate of available market price, estimate of capitalized income

Original 8108

and finally an estimate of value. The benefits, or returns, derived from ownership of a dwelling property may be in the form of amenities or satisfactions, or in the form of money. The valuation analysis gives consideration to these returns by a prescribed method of capitalization of income. A capitalization of rental-income method is used when the anticipated returns are primarily monetary.

The mortgage credit risk in a mortgage loan transaction is the probability of the failure of the mortgagor to fulfill his promise of future payments in accordance with the terms of the mortgage transaction. The purpose of mortgage credit analysis is to determine the degree of mortgage credit risk in mortgage transactions to be insured and to limit the probabilities of foreclosure or collection difficulties through the application of predetermined standards with respect to acceptable risks. Mortgage credit analysis does not contemplate forced sale of the mortgage security to accomplish liquidation or to avoid loss. In some transactions there may be sufficient assurance that loss to the mortgagee or to FHA can be avoided through forced sale of the mortgage security, but to predicate the making of mortgage loans on this basis would not be in the best interests of mortgagors. A mortgage lending policy, to be sound from all points of view, must be based upon the probability that the mortgagors will be able and willing to protect their ownership of mortgaged properties.

Giving proper weight to the prospective homeowner's ability to meet the terms of his mortgage is a highly important part of the FHA insured mortgage system. It is a vital factor in the economic soundness of the transaction from the point of view of the government's insurance risk. It is an important aspect of the homeowner's enjoyment and satisfaction with his purchase. It is a stabilizing influence on the whole home building and allied industries.

To gauge the risk introduced into a mortgage transaction by the borrower's ability to meet monthly payments, three estimates must be made. The first is an estimate of the prospective mortgagor's dependable, continuing income, termed "effective income" by FHA. The second is an estimate of the cost of occupancy of the property which FHA calls "prospective monthly housing expense". Third, all debts, living costs and other financial demands are considered. All these factors are then related to judge the feasibility of the loan.

It is seldom possible to make a really reliable estimate of an individual's anticipated income over a period of 15 to 30 years. However, the first years of a mortgage loan are the period of greatest risk, and a forecast of a prospective borrower's income during this early period can be made with some degree of certainty. For practical purposes, this early period of risk may be assumed to be approximately one-third the term of the mortgage.

0018 8110

In making a realistic estimate of dependable income, FHA screens out all except that of a continuing nature. Dependable, stable, continuing income after deducting federal income tax is called "net effective income" by FHA. It represents the amount of money with which the borrower can confidently expect to meet his household and other expenses. A person's income from overtime work, employment of members of the family other than a steadily employed wife if the family pattern has been established as including her employment, return of a capital investment, the renting of a room or the rendering of occasional personal services cannot be viewed realistically as dependable continuing income.

In estimating the prospective monthly housing expense, the following are taken into consideration: mortgage principal and interest, mortgage insurance premium, hazard insurance premium, taxes, special assessments, maintenance, repairs, heat, and utilities. The estimate of prospective housing expense is then compared with the housing expense the borrower is accustomed to paying. If the prospective expense is greater than that previously paid, and if the applicant has been unable to build up a financial reserve while paying the lesser amount, the greater degree of risk must be recognized. When the housing expense is increased without a corresponding increase in income, downward adjustments in other living standards are difficult to make. Charts portraying the relationship between prospective housing expense and net effective income are available at FHA insuring offices.

Other analyses are made to determine that past credit experience with the applicant has been acceptable, that the prospective mortgagor's income is stable and that he has the funds necessary to make the down payment and the deposits to reserves without resorting to unacceptable secondary financing. In connection with the latter, prior to mortgage insurance endorsement, mortgagors must certify that they will not have outstanding any other unpaid obligations contracted in connection with the mortgage transaction or purchase of the property except obligations which are secured by property or collateral owned by the mortgagors independently of the mortgaged property. FHA does not feel that furniture, trade tools, or automobiles which an applicant uses in his employment or business would be acceptable security for loans to supplement the insured mortgage.

An FHA insured mortgage can be paid in full, without an adjusted premium becoming due, under the following circumstances: (a) no more than 15 percent of the original amount is prepaid on the principal in any calendar year; (b) the loan is refinanced with another FHA loan; (c) the loan is retired by payments as originally scheduled; or (d) prepayment takes place on or after the 120th scheduled payment. The adjusted premium charge is a maximum of one percent of the original amount of the mortgage or the amount of mortgage insurance premiums which would be paid through the 120th scheduled payment.

$118 8112

The chart following contains information on those home mortgage segments of the National Housing Act in which there is most activity. Similar information for project mortgages is not included here but may be obtained at your local FHA insuring office.

All of the above are as of February 1, 1970, and are subject to change. It is not meant to be a complete resume of all requirements, but merely sets forth certain pertinent points. The maximum interest rate is 8-1/2 percent. The Mortgage Insurance Premium is one-half of one percent, except for Title X. The term of the mortgages, for the most part, may not exceed three-fourths of FHA estimate of remaining economic life, or 30 years (35 years where proposed construction is involved and the purchaser cannot qualify with a 30-year term) except that certain mortgages under Section 221 may be for 40 years. The FHA examination fee is $45 for proposed construction cases and $35 for existing or under construction properties.

ORS 86.610 specifically permits Oregon financial institutions and lenders to make loans secured by real property or leasehold for which the Federal Housing Administration insures or makes a commitment to insure, and may obtain such insurance.

Other lesser known sources of real property financing programs are the Federal Home Loan Bank Board, the Department of Agriculture, and the Small Business Administration.

Federally insured mortgages may be purchased by the Federal National Mortgage Association or the Government National Mortgage Association.

8118 8112

Section	Purpose	Number of Units	Amount Insurable	Loan-Value Ratio
203b	Finance proposed or existing dwellings.	Owner-occupant borrower 1 2 3 4	 $33,000 $35,750 $35,750 $41,250	Owner-occupant (a) Properties approved for insurance prior to beginning of construction or completed one year or more: 97% of the first $15,000 of FHA valuation; plus 90% of next $10,000 of FHA valuation; plus 80% of all valuation over $25,000. (b) Properties not approved for insurance prior to beginning of construction and construction completed less than one year: 90% of the first $20,000 of FHA value; plus 80% of all value over $20,000. Non-owner occupant 85% of the amount computed for an owner-occupant.
		Non-owner-occupant borrower 1 2 3 4	 $28,050 $30,350 $30,350 $35,050	
		If escrow commitment procedure (trade-in) is used: Same as for occupant mortgagor, subject to 15% escrow pending sale to an acceptable owner-occupant within 18 months.		
203b	Finance proposed or existing dwellings for Veterans who have not used their Federal GI home loan benefits and who obtain VA Form No. 26-8261 executed by Veterans Administration.	1	$33,000	100% of first $15,000 of FHA value or the sum of (1) value not in excess of $15,000 and (2) items of prepaid expense, less $200, whichever lesser, plus 90% of value between $15,000 and $25,000, plus 85% of value in excess of $25,000.

Section	Purpose	Number of Units	Amount Insurable	Loan-Value Ratio
221	Finance low-cost homes.	Owner-occupant borrower Displaced family 1 ..... 2 ..... 3 ..... 4 ..... Non-displaced family 1 ..... Operative-builder 1	 $18,000 $24,000 $32,400 $39,600 $18,000 $15,300	Owner-occupant 100% of FHA valuation if proposed construction or if completed more than one year. 90% of FHA valuation if under construction or not completed one year. Rehabilitation: (1) estimated cost of repair and rehabilitation; (2) estimated cost of repair and rehabilitation plus amount required to refinance outstanding debt against property. Operative-builder 85% of appraised valuation.
222	Finance proposed or existing dwellings for mortgagors certified as servicemen.	Owner-occupant borrower 1	 $33,000	Same as Section 203b.
Title X	Finance purchase and development of raw land.	Maximum loan of $10,000,000. Maximum term of 7 years except term may be longer where case includes privately owned water or sewerage systems. (Mortgage premium for term of 7 years or less is 2% for first 3 years and 1/12 of 1% for each additional month. Other percentages apply where term more than 7 years.		The lesser of (a) 75% of FHA value or (b) 50% of FHA value before development, plus 90% of FHA estimate of cost of development.

8114

Section	Purpose	Number of Units	Amount Insurable	Loan-Value Ratio
203h	Disaster housing. Finance dwellings for owner-occupant borrowers.	1.....	$14,400	100% of FHA valuation.
203i	Finance proposed on existing dwellings. Non-farm or farm of 5 or more acres adjacent to highway.	Owner-occupant borrower 1..... Operative-builder 1.....	 $16,200 $14,300	Owner-occupant 97% of the first $15,000 of FHA valuation; plus 90% of next $5,000 of FHA valuation; plus 80% of all valuation over $20,000. Operative-builder Proposed construction only: 85% of FHA valuation.
203k	Alteration, repair and improvement of existing structures outside urban renewal areas.	$16,000 per family unit. (May not exceed $41,250 on a 4-family structure)		Amount of loan plus any outstanding debt related to the property cannot exceed amount and ratio insurable under Section 203b.
220h	Alteration, repair and improvement of existing structures in urban renewal areas	$12,000 per family unit. (May not exceed $41,250 on a 4-family structure)		Amount of loan plus any outstanding debt related to the property cannot exceed the amount and ratio insurable under Section 203b.

Section	Purpose	Number of Units	Amount Insurable	Loan-Value Ratio
234	Condomium Housing. Finance the purchase of individual units in multifamily housing projects on an ownerships, rather than on a rental basis.	1	$33,000	Owner-occupant. Same as 203(b) Non-owner-occupant Same as 203(b)
235	Interest subsidy on Home Mortgages. Finance the purchase of a home or a membership in a cooperative housing project by low-income families. Assistance is in the form of monthly payments by HUD to the mortgagee to reduce interest costs on a market rate home mortgage insured by FHA to as low as 1 percent if the homeowner cannot afford the mortgage payment with 20 percent of income.	1 ..... 1 (5 or more and for home containing 4 or more bedrooms) 2	$18,000 $21,000 $24,000	100% of FHA valuation with a minimum of $200 down which can apply to reserves.
237	Mortgage Credit Assistance for Homeownership. Provide mortgage insurance to finance homeownership for low-and moderate-income families whose credit history does not qualify them for insurance under normal standards. (This program is not operative as of February 1, 1970).	1	$18,000	Same as the section of the Act pursuant to 237.
Title I	(Mobile Home Loan Insurance) Finance the retail sale of mobile home units to owner-occupants.	1	$10,000	Maximum term up to 12 years and 32 days at interest rates determined according to Title I discount rates.

State of Oregon

Veterans' Farm and Home Loans

PURPOSE OF THE LOAN

The State of Oregon provides loans to eligible war veterans, upon security consisting of real property located in Oregon, for the acquisition of homes and farms. The program is administered by the State Department of Veterans' Affairs.

It must be the applicant's intent to occupy the property as his own home. The term "acquisition" for purposes of the loan means:

1. The purchase of real property and its improvement.

2. To pay off a purchase contract, a purchase-money mortgage, or a mortgage in the nature thereof, and the improvement of property so acquired.

3. For the construction of a home.

ELIGIBILITY

To be entitled to the loan, the applicant must be either:

1. A veteran of World War II who served on active duty in the armed forces of the United States for not less than 90 days, any part between September 15, 1940 and July 25, 1947, who was honorably discharged and who was a resident of Oregon at time of entry to active duty or a resident of Oregon at least two years between the date of discharge and December 31, 1950; or

2. A veteran of the Korean emergency who served on active duty for not less than 90 days, any part between June 25, 1950 and January 31, 1955, was honorably discharged and was a resident of Oregon at time of entry to active duty or a resident of Oregon for at least two years between the date of discharge and December 31, 1960; or

3. A veteran of the post-Korean period who has served on active duty in the United States armed forces not less than 210 days, any part after January 31, 1955, unless he was discharged for service-connected injury or illness before

completing such period of service. He must have been honorably discharged, and have been a resident of Oregon at time of entry to active duty.

DEADLINES

The deadline for World War II veterans to apply for loans is January 31, 1980. The deadline for Korean veterans to apply is January 31, 1988. The deadline for post-Korean veterans to apply is 20 years following discharge.

LOAN TERMS

The veteran may borrow up to $21,500 for the acquisition of a home or up to $80,000 to acquire a farm. In no event, however, may the loan exceed 85 percent of the mortgage loan value of the property.

The interest rate on a home loan is 4 percent up to $18,500. On the amount borrowed over $18,500 the rate goes to ½ percent above the price of the latest bond sale, but to not less than 4½ percent.

The interest rate on a farm loan is 4 percent up to $50,000. On the amount borrowed over $50,000 the rate goes to ½ percent above the price of the latest bond sale, but to not less than 5 percent.

The maximum term for repayment under the law is 25 years for homes and 30 years for farms, but it may be less, depending on the age, quality and location of the property, and other factors.

Repayment of the loan will be on a monthly basis when the security consists of city or suburban property, acreage, or a complete farm unit having a monthly income. In other cases involving complete farm units, payments may be arranged on a quarterly, semiannual or annual basis.

There is no penalty for paying off the loan in advance.

Included in the borrower's monthly or other periodic payments to the department will be an amount sufficient to meet the annual property tax requirements. The borrower is required to keep the property insured against fire loss.

DOWN PAYMENT

The applicant is required to have an equity in the property.

Generally, the amount of equity required will be in excess of 10 percent of the amount of the loan granted, and in some cases might be for the full amount of the difference between the state loan and purchase price. The department will approve secondary financing in those instances where the minimum equity requirement is met and the veteran's ability to repay is satisfactory.

MORTGAGE CANCELLATION LIFE INSURANCE

The Department of Veterans' Affairs has provided a low-cost mortgage cancellation life insurance plan whereby any qualified borrower may obtain life insurance in the amount of the unpaid balance of his loan. In the event of the veteran's death, the insurance will pay the balance on the loan and the state's mortgage will be released. The insurance plan does not increase the borrower's monthly payments because the cost of the insurance is taken care of by extending the customary loan repayment period. The premium rate, effective March 1, 1970, was 37 cents per month per $1,000 of insurance. The rate is subject to change annually.

TO APPLY FOR A LOAN

The loan applicant fills out and submits an eligibility form (DVA-1) to the Department of Veterans' Affairs, along with a full-size photostatic or certified copy of his honorable discharge and his notice of separation. He should do this in advance of his actual need for the loan, where possible.

He then completes the loan application form and submits it to the department, along with a copy of the earnest money receipt or agreement to purchase. Applications may be filed in any of the three department offices. The addresses are:

Department of Veterans' Affairs
General Services Building
1225 Ferry Street SE
Salem, Oregon 97310
Phone: 378-4624

Department of Veterans' Affairs
State Office Building
1400 SW Fifth Avenue
Portland, Oregon 97201
Phone:

Department of Veterans' Affairs
338 W. 11th Street
Eugene, Oregon 97401
Phone:

8119

Veterans living in counties employing county service officers may obtain assistance in such offices.

After the veteran's eligibility has been established and his loan application submitted, the department will appraise the property and will check such things as the veteran's employment record and credit standing. The veteran will then be advised as to whether the security and his standing are sufficient for the required loan.

LOAN COSTS

When a veteran's loan is completed he will pay a service charge, which will be used by the department to pay the costs of appraisal and loan closing. The service charge is based on the type and location of the property and the amount of the loan. The service charge for homes will range from $56 to $87, and for farm loans from $56 to $280. The charge may exceed these limits if more than one parcel of real estate is offered as security.

SOURCE OF LOAN FUNDS

The Department of Veterans' Affairs is the lender under the Oregon veterans' farm and home loan program; the loan funds come from the department, and go direct to the veteran borrower.

The department obtains its loan funds primarily from the sale of self-liquidating bonds, and it also makes loans from the funds derived from veterans' loan repayments.

The Oregon veterans' loan program is a self-sustaining operation, and has built up a net operating revenue of more than $26 million since the program started in 1945, of which nearly $14 million has been turned over to the State General Fund.

TIPS FOR BROKERS

1. A veteran who has not used his full entitlement to a loan may receive the difference to purchase another home or to make improvements to his present home. In certain cases involving the loss of his home through no fault of his own, he may have his entire loan entitlement restored.

2. A state veterans' loan may be assumed by another person. The interest rate goes to 1½ percent above the price of the last bond sale unless the new purchaser is the spouse, former

spouse, parent, child or stepchild of the veteran giving up the property.

3. The interest rate may change each time the property is transferred. Therefore, agents assisting a person in acquiring a state-mortgaged property should contact the Department of Veterans' Affairs to determine what the interest rate will be at that time. On transferred loans, the new interest rate will take effect on the date of the instrument of transfer.

4. When a person assumes a state veterans' loan, he should send the Department of Veterans' Affairs a copy of the instrument conveying the property and give the new owner's name and address. The deed or contract must contain a clause stating that the purchaser assumes and agrees to pay the balance on the state's mortgage, or the instrument will be invalid by law. If the buyer is entitled to the interest rate being paid on the original loan, he should request the department's approval.

5. When a portion of a property under a state veterans' loan is sold, the department should be contacted prior to the completion of the transaction to arrange for a partial release of mortgage.

VETERANS ADMINISTRATION

1. Eligibility for Veterans Administration home and farm loans.

   a. A World War II veteran who served at any time between September 16, 1940, and July 25, 1947, and was discharged under conditions other than dishonorable after at least 90 days active service (or for service incurred disability in less than 90 days).

   b. A Korean Conflict veteran who served at any time between June 27, 1950, and January 31, 1955, inclusive, and was discharged under conditions other than dishonorable after at least 90 days active service (or for service incurred disability in less than 90 days).

   c. Post-Korean veteran who served on active duty for 181 days or more, any part of which occurred after January 31, 1955, and who was discharged or released from active duty after such date for a service-connected disability. Servicemen who served at least 2 years in active duty status, even though not discharged, while their service continues without a break.

d. Unremarried widows of the above-described eligible persons who died as the result of service.

e. Women members of the Armed Forces in qualifying services.

2. The terminal date for loan guaranty benefits for each World War II, Korean conflict and post-Korean veteran is computed by the use of a special formula which provides that each veteran has 10 years of basic eligibility from date of discharge or release from his last period of active duty, any part of which occurred during wartime or the post-Korean period plus 1 year of eligibility for each 3 months of active wartime or post-Korean military duty plus 4 days for each additional day of active duty, but not to exceed the maximum terminal date for each class of veteran. The eligibility of servicemen is available so long as they remain on active duty. If they are discharged or released from active duty before using their entitlement, a new determination of their eligibility must be made, based on the discharge received. The dates used in computing active wartime military service for World War II veterans are from September 16, 1940 through July 25, 1947; and, for veterans of the Korean conflict are from June 27, 1950, through January 31, 1955. The beginning date for post-Korean veterans is February 1, 1955. The law does not specify an ending date for post-Korean veterans. The minimum and maximum terminal dates for loan benefits for each class of veterans are:

a. World War II veterans -- from July 25, 1962, through July 25, 1970.

b. Korean conflict veterans -- from January 31, 1965, through January 31, 1975.

c. Post-Korean veterans -- March 3, 1976, is the minimum terminal date. The maximum terminal date is 20 years from the date of discharge or release from the last period of active duty. If eligibility is based on 2 years' active duty, entitlement is available so long as the serviceman remains on active duty without a break.

3. If the veteran does not have a current Certificate of Eligibility he may request a VA Form 4-1880, "Request for Determination of Eligibility and Available Loan Guaranty Entitlement: from the Portland VA Regional Office or from a lender, such as a bank, savings and loan association, mortgage broker, etc., or County Service Officer. The completed form should be sent to the VA Office together with all service and separation papers which will be returned to the veteran after the eligibility determination is made.

4. It is important that the veteran obtain a Certificate of

Eligibility so that if he is applying to a lender for a guaranteed loan, the lender will know he is eligible and also make sure that the loan application will be submitted timely to the VA. In cases involving direct loans made by the VA, it is required that the application be received by the VA and a commitment issued to the veteran for a loan before the terminal date of his eligibility for loan benefits.

5. If the veteran sells his house for a compelling reason and the loan has been paid in full, his eligibility may be restored.

GUARANTEED HOME LOANS

1. With respect to GUARANTEED LOANS, there is no limitation on the amount of a loan eligible for guaranty. The limitation is upon the amount of guaranty that can be issued upon the loan. The maximum guaranty is $12,500 and the VA will guaranty 60% of the loan or $12,500 whichever is less. The VA does not require a down payment by the borrower.

2. Loan is made by a lending institution such as a bank, savings and loan association, insurance company, mortgage company, public and private lending agencies or individuals who are in a position to look after the loan properly. If the veteran qualifies, the VA guarantees the loan up to a certain amount, so the lender will probably not suffer any loss in case of failure to repay the loan.

   a. Obtain earnest money receipt or land sales contract if existing property; have three sets of plans and specifications on proposed new construction, also firm bid on construction cost and earnest money receipt if land is purchased separately.

   b. Locate lender who will make GI loan at a rate of interest not in excess of the maximum rate which is now 8½%.

   c. Ask lender to send in VA Form 4-1805, Request for Determination of Reasonable Value.

   d. The lender and VA will process the case from here on.

DIRECT HOME LOANS

1. The VA Portland Regional Office makes direct loans to veterans for housing in housing credit shortage areas in the State of Oregon designated by the Administrator. These areas are generally rural areas and small cities and towns not near the metropolitan

area of large cities. The currently eligible direct loan designated areas can be obtained from the VA Regional Office.

a. Obtain earnest money receipt or three sets of plans and specifications as in guaranteed loans.

b. Have veteran write to VA Regional Office, 426 SW Stark Street, Portland, Oregon 97204, requesting direct loan, giving brief description of property, its selling price and amount of loan desired to finance the purchase or construction, including land, if any, to be purchased.

c. Send Certificate of Eligibility with request for direct loan application. If certificate not available, complete VA Form 4-1880 and forward same to the Regional Office along with discharge or separation papers which show dates of entry into and discharge from active service. Direct loan application will be sent if veteran is eligible.

d. Veteran should be alerted to be ready to send in $50.00 with his loan application as instructed when he receives blank application form from VA and to be ready to pay certain closing costs assessed to him, plus tax and insurance reserves at the time of loan closing. The VA charges on origination fee of $50.00 or 1 percent of the loan whichever is greater (2 percent if the direct loan is used to finance the construction of the home and if stage payments are necessary - 1 percent if stage payments are not required). The credit report, appraisal fee, and the loan closers fee are paid out of this origination fee.

e. VA will process from here on. If the veteran and realtor express written desire, all letters and forms may be mailed to the veteran in care of his realtor.

2. The maximum direct loan which the VA can make the veteran if he has not used any of his entitlement, is $21,000, including funding fee, if any.

GENERAL

1. In both types of loans, guaranteed and direct, the parties should draw up earnest money receipt in such manner as to expressly provide for return of deposit and cancellation of earnest money receipt if for any reason the type of loan desired cannot be advanced.

2. To qualify for a loan, the law requires that the contemplated

8125

terms of payment of the loan bear a proper relation to the veteran's present and anticipated income and expenses and that he be a satisfactory credit risk. He must have sufficient income to repay the loan, all other obligations and have enough remaining for his family support.

3. The present interest rate on guaranteed and direct loans is 8½%.

4. A fee of one-half of 1 percent of the loan amount must be paid to VA in the case of loans for post-Korean veterans and servicemen. This is a one-time payment fee. The fee will not be required if the veteran, at the time of loan application was also eligible for loan based on World War II or Korean conflict service. The loan fee may be added to the loan amount.

5. The law requires that the amount of the GI guaranteed or direct loan may not exceed the reasonable value of the property, as determined by the VA. If the price the veteran agrees to pay for the home is more than such reasonable value, the veteran must pay the difference in cash from his own resources. The loan may exceed the reasonable value by the amount of the one-half of 1 percent payment made by post-Korean veterans if it was included in the loan.

6. The veteran must certify in his loan application that he now occupies or will occupy the property as his home within a reasonable period of time after completion of the loan.

7. When a veteran is selling his home, he should be counseled that he remains liable on his VA loan but can make application to the VA for release of personal liability. This release will be granted by the VA i the purchaser assumes all of the veteran's liability and it is determined that he qualifies as a good credit risk.

8. Farm loans to purchase a farm and farm residence which is to be occupied by the veteran personally as his home are eligible for guaranty when made by a lender. These loans which are not limited in amount not exceeding the established reasonable value of the property, may be guaranteed up to a maximum of $12,500. Real estate loans for farm purposes only, and not for residential occupancy by the veteran, although not limited in amount may be guaranteed up to a maximum of $4,000.

9. Direct loans are available only for housing and includes purchase of a farm on which there is a farm residence to be owned and occupied by the veteran as his home. Direct loans are also available to build on land owned by the veteran a farm residence to be occupied by him as his home.

10. A guaranteed or direct loan may be partially or fully prepaid at any time without penalty premium or fee.

11. The VA Regional Office in Portland, Oregon, will answer any questions regarding the Veterans Administration program. The office address is:

Veterans Administration
Regional Office
426 SW Stark Street
Portland, Oregon 97204

Q. 28 Briefly define "amortization".

Q. 29 Which of the following statements relating to real estate loans is not true?

(A) conventional loans include straight loans
(B) conventional loans include amortizing loans
(C) conventional loans are two-party transactions
(D) conventional loans are three-party transactions

Q. 30 Which of the following does not belong in a list of sources of home purchase financing?

(A) land contracts
(B) conventional bank mortgages
(C) G. I. guaranteed loans
(D) F.H.A. title I loans

Q. 31 Most commercial transactions involving computation of interest are based on:

(A) the banker's year
(B) government year
(C) individual selection
(D) some other method

Q. 32 What is "usury"?

Q. 33 What is the maximum "contract rate" of interest in Oregon in the purchase of a home?

SUGGESTED WAYS TO FINANCE

1. Cash.
2. Conventional loans (savings and loan associations, insurance companies - 75%, 80%, 90%; 25 and 30 years).
3. Insured 90% loans, (maximum loan is $31,500.00).
4. First Mortgage (held by seller).
5. Land Contract (try to make a marketable contract).
6. Second Mortgage (monthly payments or short term due date).
7. F. H. A.
8. Federal V. A.
9. Combination F. H. A. and V. A.
10. Collateral Savings Accounts as additional security for a loan (they draw interest).
11. Assumption of loan (be sure to check for a change in interest rate).
12. Rent with Option to Buy (try for high monthly payments).
13. Blanket Loan-check equity. (Putting more than one property under one loan.)
14. Personal Loan (finance company, bank or credit union).
15. Short term loan on life insurance.
16. Pledge (stocks or bonds).
17. Broker-Purchase, re-sell on land contract, or first and second mortgage, Trust Deed.
18. Trade-either as principal or as agent. Also, guarantee or direct exchange.
19. Owner (re-finance, then sell on terms). Seller best source of financing.
20. State V. A.

Reminder:

The money market changes every month and current interest rates are constantly changing. It is necessary to keep up on this at ALL times. Be certain to find out just how much down payment a buyer has and how much he can pay per month and whether or not monthly amount is to include taxes and insurance. It is absolutely necessary to have this information and refer to it often.

Remember to try a "delayed closing" - anything is better than a contingency.

Q. 34 What is a conventional loan?

Q. 35 What is a "discount" as applied to mortgage loan financing?

Q. 36 What is the current FHA mortgage insurance charge?

Q. 37 What is the prepayment penalty rate for an FHA insured mortgage?

Q. 38 What is the maximum dollar loan available under FHA insurance coverage for a single residential unit?

Q. 39 The minimum down payment on a VA loan for residential property is:

(A) 2½%
(B) 10%
(C) depends on age of dwelling
(D) none of the above

Q. 40 The VA in guaranteeing the loan of an eligible veteran requires that any escrow fee be paid by the:

(A) seller
(B) buyer
(C) seller and buyer equally
(D) mortgagee

Assumption vs. Refinancing

Many factors make assumption of an existing mortgage generally more favorable than a refinancing of the loan.

A new loan fee usually runs from 1% to 2% of the loan. There is quite probably a prepayment penalty clause in the old mortgage. Prepayment penalties on FHA insured loans are 1% of the original amount. Many mortgages contain clauses establishing penalties of up to six months interest on the existing balance. Such penalties can run from $150 to $500.

An assumption can avoid expenditure of a few dollars in reconveyance fees. Frequently the interest rate on an old mortgage is lower than the current rate. This, of course, could be upset with the exercising of an acceleration clause which could force refinancing at a higher rate.

On the other side of the coin, some institutions charge as much for an assumption fee as a new loan —this makes assumption not so attractive.

Assumption fees on FHA and VA mortgages range from $25 to $40, and interest rates cannot be raised regardless of the market.

Assumption is most favorable on FHA, VA, and conventional bank loans.

Prepayment Penalty Shown

As part of a "truth in lending" package, Chapter 336, Laws of 1967, requires a full disclosure of prepayment penalties attaching to a real estate loan.

The law requires that any person making a loan having a loan period of more than three years secured by a mortgage or trust deed shall expressly and clearly state on the loan agreement and promissory note any maximum prepayment privilege penalty during the first year of the loan period and for each year thereafter.

A violation makes any prepayment privilege penalty in the loan agreement or promissory note void. (See "loan agreement" in Words and Phrases section)

Why a Contract Sale?

Sale of real property on contract frequently offers a number of advantages. Some of these are:

1. Saves the mortgage discount. Assuming the discount to be 4% a seller saves $400 on a $10,000 mortgage.
2. A higher price. Experience has demonstrated that the lower the down payment the higher the price.
3. An excellent investment for the owner. The seller gets a fair return on his actual investment in the property plus the same return on the normal equity appreciation due to inflation. In many cases he receives the difference between a lower existing mortgage interest rate and his contract rate.
4. Tax savings. For higher income tax bracket sellers the contract is very meaningful.
5. Use contract as collateral. The contract can be pledged as security for a loan, or can be used to acquire other property.
6. A fast, completed transaction.

Sales Price Disclosure

Primarily as an assist to county assessors in the establishment of comparable sales data, Chapter 462, Laws of 1967, prohibits the recording of any instrument conveying real estate or an interest therein unless the actual consideration is shown.

The law requires that the actual consideration paid for such a transfer be stated in terms of dollars on the face of the instrument.

"Consideration" includes the amount of cash and any lien, mortgage, contract, indebtedness or other encumbrance existing against the property and agreed to be paid or assumed by the purchaser.

Primary responsibility for attaching the information is that of the grantor, but if he cannot act then the recital shall be made by the grantee. There must be a signed verification of the recital.

The giving of a false statement as to true and actual consideration is punishable by a fine of up to $500. The law was made effective January 1, 1968, the effective date of repeal of the federal documentary tax on real estate transactions.

Usury

Usury simply means charging more than the lawful rate for the use of money. Each of the 50 states has a usury law. The law in each of the states differs.

In each state there are two lawful rates—a legal rate and a contract rate.

The *legal rate* is that sought to be charged when two individuals—a lender and a borrower—engage in a loan with no contract or understanding as to rate. This is rare.

The *contract rate* is that agreed upon either verbally or by written document. This is the kind of credit we grant or accept every day.

In Oregon the *legal rate* is 6 percent. The *contract rate* is 10 percent.

There are some exceptions. The law itself provides that a commercial corporation may agree to pay not to exceed 12 percent interest. Pressures on the legislature have given us a Motor Vehicle Loan Law, an Industrial Loan Law, and a Small Loan Law—all of which permits interest rates beyond the usury statute.

TITLE, LAND ABSTRACTS, TITLE INSURANCE AND ESCROW AGENTS

What Is "Title"?

The word "title" represents to the real estate broker and salesman, as well as the title insurance man, the commodity with which he deals.

It is idiomatic for the average person to state that he has bought or sold "real estate." Newspapers advertise "real estate" for sale, yet it is only the "title" to real estate which can be bought.

WORD HAS MANY DEFINITIONS

It is interesting to explore the meaning of the word "title" as applied to real property law. Some dictionaries define the word as meaning the right to or ownership of property; others that it be the evidence of right which a person has to the possession of property.

Still another definition as applied to real property is the investigation of titles as one of the principal branches of conveyancing, and in that sense the word "title" has acquired the sense of "history." Therefore, we refer to searching the title, investigating the title, opinion of title, and title insurance.

Regardless of the numerous definitions of the word "title", it should be remembered that the word is synonymous with the words "right", "interest" and "estate." Such words are used to denote the degree, quantity, nature and extent of the interest a person may have in real estate.

There are many and varied interests in real estate which the words "title" and "estate" define when coupled with other words, such as "fee simple estate."

Such a designation of ownership means that the owner has the largest estate in land known to the law. His title when so designated means that he has the greatest use and enjoyment of the land.

Other designations of ownership may disclose limitations of ownership. It is well to remember that a person may have "title" to real property and not be entitled to the possession thereof, and conversely, a person may have possession of real property without benefit of "title."

POSSESSION NOT "TITLE"

As an example: A lessee, a tenant from month to month, or a life tenant may, within the provisions of the tenancy, enjoy the possession of real property and never have "title." Also one may purchase or inherit "title" but may be precluded from gaining possession thereof because of the existence of a lease or a life tenancy. In order to ascertain the extent of the "Title" it is necessary to search the title.

Land Abstracts and Title Insurance

The record of the ownership of land is as old as the written history of man. In the clay tablets of the Assyrians and Babylonians are records of land transactions and mortgages. However, our form of title records and of title evidence may be considered as beginning with the year 1066, when King William the Conqueror and his Norman Nobles conquered the Anglo-Saxons and began the long line of Norman Kings of England. This marks the beginning of the feudal system in England which, in the common law of England, became the foundation of our law of land titles and real property.

Many of our present concepts of the law of real property originated with the feudal system, from which we take the word "fee." When an owner of property dies without leaving heirs and without having made a will the property escheats to the State in the same manner as property returned to the King. All our real estate titles originate by patent or grant from the sovereign government. Similarly, in the same manner as the English kings controlled the descent of property under the feudal system the State regulates the manner in which property descends upon the death of the owner.

However, our present forms of deeds and mortgages are much more recent than the beginning of the feudal system. In feudal times a transfer of title was effected by a symbolic ceremony known as livery of seisin, in which the parties with their witnesses went upon the land and the seller gave the buyer a stick or twig or some other object as a token of delivery. Until the passage of the Statute of Frauds in England in 1677 the use of a written instrument in real estate transactions was optional. Even today in England many titles are evidenced by possession of the property and by exhibition of the original title deeds, and one of the principal activities of many English solicitors is the safeguarding of the original deeds which they keep in their possession. In the Thirteen Colonies, probably because it was newly settled land and there was much travel between settlements, a system of recording land transactions was adopted, and after the Revolution the new country took over the recording system then in effect. Originally the recorded documents were copied into record books in longhand by pen and ink. Later typewritten records were substituted for hand copying, and today much of the recording is done by photography.

Originally attorneys examined the county records of land transactions and issued their opinions of title based upon their own examination of the title records. In the course of time it became ncessary for the attorneys to prepare abstracts of the records containing copies of the various instruments and court proceedings which they examined to write their opinions. In some parts of the United States the attorneys still make their own abstracts. However, today abstracts are usually prepared by qualified companies which specialize in this work. The preparation of abstracts by abstract companies and the examination of them by attorneys is still the pattern in some parts of the United States.

LAND ABSTRACTS

The title to any parcel of real estate is contained in and controlled by the recorded and filed documents in the public records of the county in which the land is situated.

Under provisions of the recording acts, the public has constructive notice of all property recorded and of all filed papers. That is, one is presumed to know the existence and legal effect of every paper affecting title to land which has been properly recorded or filed in the county.

In order that one may examine the title to a parcel of land, to determine ownership and condition of the title, it is necessary that a search be made of these public records. Further, to know the contents of all the instruments disclosed by such search. This implies the reading of all of these records in their entirety.

Abstracting is the "briefing" or "digesting" of the particular records affecting a given parcel of land. An Abstract of Title contains a digest of every instrument or event brought out by the search, arranged in chronological order, to enable an examiner to determine the ownership and condition of title. Every fact and element in the records bearing in any way on the title to such parcel of land must be included in an Abstract of Title.

An Abstract of Title is often referred to as a "History of Title." It must necessarily show each transfer of ownership, whether by deed, descent, devise, or foreclosure; also any mortgage, lien, encumbrance, or other matter in any way affecting the title. Consequently, most Abstracts of Title are voluminous. This "book" or "history" called an Abstract of Title must be carefully preserved by the owner, presenting a difficult storage problem in many cases.

It must be stressed that an Abstract of Title is merely the history of happenings to a particular parcel of land, as shown by the records. Thus, one may have a perfectly good abstract and a very poor title. The Abstractor's certificate covers only the completeness of his work in showing a digest of the records. An Abstract of Title must be thoroughly examined by a competent attorney familiar with real estate law, in order that the persons interested in the land may know the ownership and condition of the record title. Of course, no Abstract of Title can cover unseen hazards such as missing heirs, forged deeds, transactions by a minor or incompetent, etc.

The voluminous procedure necessary in the use of Abstracts of Title in the closing of real estate transactions has practically eliminated their acceptance by money lenders and most buyers of real estate. Other inadequacies of an Abstract of Title, such as limitation of liability, additional examination costs, with consequent delay in closing of a transaction, and the duplication when land is divided, have resulted in the Abstract of Title becoming obsolete in most areas of this State.

DEVELOPMENT OF THE TITLE INSURANCE COMPANY

In order that the title to property might be transferred more freely, the idea of a title insurance policy was conceived. The first policy was issued in Philadelphia in 1875. The growth of the title insurance business has been very rapid. In most parts of the United States it is the only method by which title is evidenced. It is a well-known fact that in no country in the world today is the transfer of real property so free of delay, red tape and hazard as in the United States.

The first title insurance policies in Oregon were issued in 1911. Today, almost all real property transactions in Oregon involve the use of a title insurance policy.

Generally speaking, title insurance is a statement of who owns, and what other interests there are in, and what charges exist against, a parcel of land; with certain agreements written into a policy for the protection of those insured. The policy is an insured statement of the condition of the title.

The title insurance company keeps a complete and up-to-date history of every parcel of land in the county, in order to tell an owner about his title. In Oregon these records go back to the original settler's patent—in many cases these records cover a period of over 100 years. Daily the thousands of entries on the public records of the courthouses of Oregon are noted by the searchers of the title insurance companies and entered in their records. Accurate ownership maps are kept up to date. Title examiners constantly review court decisions and new statutes which affect ownership in land. When an order for title insurance is received, a searcher makes a list of all the documents, legal action, judgments, tax liens, taxes, deaths, divorces, and other items that affect the particular tract of land, and a title examiner examines this, and a title report is made listing the owner of the property, how the title is held, the correct legal description, and any exceptions, any outstanding rights owned or claimed by others. When the transaction is closed, a title insurance policy is issued.

POLICY COVERAGE, EXCEPTIONS AND STIPULATIONS

The title insurance policy insures against losses which might be suffered:

—if any document in the series of record by which ownership was acquired was improperly drawn, signed or delivered;

—if any of the deeds and other documents were signed by minors, incompetent or insane persons, or other persons suffering from disabilities which might invalidate their acts;

—if any of the documents in the series of records are forged, in which case they are void;

—if any past legal proceedings essential to establish title are defective;

—if unknown or undiscovered heirs of any deceased owner whose estate had been distributed, attempt to set aside the distribution and claim an interest in the property;

—if someone who has executed a document essential to the title has acted in excess of his authority;

—if a husband or wife claims curtesy or dower in a parcel of land by reason of their failure to join in deeds conveying the tract;

—if there are any unpaid county or city taxes or liens on record which are not shown in the policy;

—if certain records, disclose any easements, conditions, covenants, restrictions, reservations, exception, mechanic's liens, mortgages, leases, attachments, judgments, executions, contracts of sale, or any other city liens or encumbrances which are not shown in the title insurance policy.

In general, the things not insured in a policy are called "exception." The printed exceptions are stated in the policy and are, in the main, things which do not appear on public records in the county, and which can be ascertained by inquiry or examination of the

premises by the insured. If these exceptions were eliminated from the policy, a substantially higher premium would be charged; for the title insurance company would have to make a search of these off-the-record items.

The title insurance policy does not insure against the following items:

—defects, liens, claims, encumbrances, or other matters existing at the date of the policy and known to the insured, unless disclosed to the title insurance company;

—easements, liens, or encumbrances, including material or labor liens, which are not shown by the public records—such as—an unrecorded easement for public utility purposes; liens for labor or materials used in constructing or repairing a building, which, in Oregon, can in some cases be filed up to 60 days after the work is completed;

—mining claims, reservations in patents, water rights, claims of title to water—patent reservations are contained in the original patent and cannot be eliminated. Mining claims and water rights cannot be ascertained by searching the county records—water right records are kept by the State Engineer in the State Capital;

—rights or claims of persons in possession, or claiming to be in possession—such as—tenants in possession under an unrecorded lease, a squatter claiming title by adverse possession, or an owner occupying a tract of land who has not recorded his deed—all items that cannot be ascertained by an inspection of the land;

—any state of facts which an accurate survey and inspection of said land would show—such as—shortages or excesses in boundaries; or buildings of others improperly placed on the tract insured, or buildings on the tract insured being partially on adjoining land;

—assessments which are not shown as existing liens by the public records; taxes not yet payable; pending proceedings for vacating, opening or changing of streets or highways preceding entry of the ordinance or order therefor—again items that cannot be ascertained by an inspection of the county records and items that the owner can readily discover by inquiry;

—zoning ordinances and similar regulations on the use of land.

TITLE INSURANCE RATES

Just as the issuance of title insurance has been the outgrowth of earlier searching and abstract methods so, too, have the fees now charged for title insurance evolved out of the charges that were made under the earlier methods of furnishing title evidence. As a matter of fact, the initial title insurance policies were issued only after the title records had been searched, an abstract of such records been prepared, an examination of such abstract made by an attorney, and an opinion rendered to the company issuing the title insurance based upon which the title insurance policy was issued. A separate charge for each phase of the process was made by the one performing the service. In some small communities where real estate activity is not great enough to support a title office this method is still employed.

As title insurance became more and more popular as the medium for evidencing title and as the real estate transactions became more numerous and complicated, this method proved impractical and inefficient and as a result the present practice of doing all the work in the title company developed.

With the institution of the practice of title insurance being issued by the insuring company based upon its own searching and examinations the method of charging for the service changed and a single premium charge covering the cost of the various operations required in preparing title insurance developed.

The present rates are based upon several considerations among which are the cost of maintaining a title plant adequate to afford safe, expedient title information; the employment of competent title examiners; the establishment of adequate reserves and deposits to protect the policyholders; the competitive nature of the business; and a fair return on investment to the owners or stockholders. As will be mentioned in the section having to do with Deposits with the State Treasurer and Regulation of Title Industry by State Insurance Commissioner, these rates must be filed with the Commissioner.

Almost everyone who deals with real estate is familiar with the printed rate tables which have been issued by the respective title companies and which set out the basic rates applicable for title insurance. These tables are only intended as a general guide and are not to be taken as a definite quotation of the fees chargeable for all title insurance for a certain amount. There are numerous other factors which may affect the title insurance premium in any specific area. For example, the issuance of a policy may involve the examination of several tracts of land which are being consolidated. In such a situation it may be that the ownership of the individual tracts being consolidated are derived under unrelated chains of title so that a separate search and examination of each tract is required in the same manner as though a separate policy had been issued to each tract. Again, the title to the property under consideration may have been involved in a great deal of litigation or other court proceedings, the examination of which requires a great amount of the examiner's time; a special form of policy may be required or special endorsements included in the policy. Any one of these situations and many others which might arise, would involve an adjustment in the fee charged for that particular policy.

For these reasons it is not a wise policy for the broker or salesman to make any definite commitment as to the charge in a specific case, but, rather it is good practice to consult the title company, which will issue the policy, for a quotation of the fee chargeable.

In addition to the basic fees shown in the printed schedules, there are many special fee arrangements which may be applicable in a given situation, such as in cases where combination policies, equity policies, or mortgage reissue policies, may be involved. In these cases the policies may be issued at rates less than the basic rates in the printed table, but the issuance of policies under these circumstances is subject to certain conditions and it would be well that all parties involved be made fully aware of these condi-

8136

tions. Again, discuss the matter with the title company.

It is most difficult to establish rates which are equitable in all cases, but the rate schedules do result in an equitable fee for the service rendered in by far the most cases. To attempt to meet the unusual case with special rates would result in both confusion and misunderstanding, and consequently is not desirable.

DEPOSITS WITH STATE TREASURER AND REGULATION OF TITLE INDUSTRY BY STATE INSURANCE COMMISSIONER

The first Oregon title insurance law was enacted in 1909. This act provided that each title insurance company must have a paid up capital stock of at least $100,000, of which $50,000 should be deposited with the State Treasurer as a guarantee fund. Thereafter every title insurance company was required to deposit each year 10 per cent of its premiums received until the guarantee fund amounted to $100,000.

In 1919 the act was amended to permit companies doing business in counties of 50,000 or less to deposit $10,000—with a guarantee fund of double that amount. Larger deposits were required for companies whose place of business was in the more populous counties.

In 1955, under the sponsorship of the State Insurance Commissioner, a new title insurance law was enacted, which substantially amended and expanded the former law. The former deposit requirements were not increased, but the act provided that deposit and guarantee fund requirements be met for all the counties in which a company does business. A company may be a statewide business if it has a guarantee fund of $100,000.

In addition to the guarantee fund, each title insurance company must maintain a Title Insurance Unearned Premium Reserve Fund, into which must be paid each year 3 per cent of the gross premium received during the year. Fifteen years of such reserves must be maintained at all times. At the end of 15 years the reserves so required to be set aside constitute a very sizable amount of money in the case of the larger companies.

The act provides that title insurance companies shall be subject to and comply with all the laws applicable to insurance companies generally and to the rules and regulations of the State Insurance Commissioner.

Title insurance companies are thus subject to audit by the department and their reserves and investments are subject to the same type of supervision and regulations as are those of other insurance companies.

The act requires that title insurance companies file with the Insurance Commissioner their rate schedules and their policy forms. It specifically provides that no deviation from the filed rates or forms of policy is permitted. Rebates and discounts to customers are prohibited.

In addition to the foregoing safeguards, the act requires that each title insurance company own and maintain a title plant with a general index, adequate maps and tract indexes for the lands of the county.

All of the foregoing requirements of the law for deposits with the State Treasurer, statutory reserves, filing of rates, supervision and control by the State Insurance Commissioner are provided for the protection of holders of title insurance policies. The industry cooperates wholeheartedly with the Insurance Department and the legislature in the enactment of the far reaching legislation contained in the 1955 act. The industry feels that such legislation and the control and supervision it provides for the industry will benefit not only the public, but also the Title Insurance business it regulates and controls.

QUESTIONS ON TITLE INSURANCE

What is Title Insurance?

Basically, title insurance is the opinion of the ownership and marketability of title to a particular parcel of real property; this opinion is backed by the promise of the title company to indemnify an insured in the event of a loss by reason of a defect or a flaw in title prior to the date of the policy.

What is a "title plant"?

A title plant is a private collection of public records meeting the minimum rules of the title insurance laws of Oregon. It is the stock in trade of a title company.

Escrow Agents

In its original concept, the escrow agent was little more than a stakeholder, accepting money or property from one party for delivery to another upon the payment of the consideration or delivery of the property which was to be accepted in return. The duties and responsibilities of the escrow agent in modern real estate practice are much broader.

The escrow agent's duties arise in the first instance from the written agreement between the parties stating the terms of the transaction, and are more fully defined and described in such written instructions as he may be given by the parties; and by the terms of such documents relating to the transaction as may be deposited. The primary source of the escrow agent's duties and responsibilities is the written instructions of the parties. These instructions are usually incorporated in printed forms supplied by the escrow agent and completed to express the details of the particular transaction. Apart from securing the necessary legal documents required to complete the transaction in accordance with the written instructions and the agreement of the parties, one of the essential functions of the escrow agent is to assemble the necessary data from which the required financial adjustments between the parties can be made. This extremely important part of the escrow closing is essentially a matter of accounting detail and includes such matters as obtaining all pertinent information on mortgage balances, interest accruals, commissions and other charges payable by the various parties; tax and insurance information, rental data and a host of allied details. As this information is assembled it is incorporated in a work sheet with adjustments made to the agreed or probable closing date. This information is then transferred to a settlement sheet for presentation to the parties in order that they may better visualize the financial results of the transaction.

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

When all necessary funds and documents have been deposited with the escrow agent and the transaction is ready to close, the escrow agent will set in motion the process of recording all documents which are to be recorded, secure the necessary assignments of fire insurance, transfer mortgages and loan reserves, and cause the necessary final title search to be made. Instructions will have authorized the escrow agent to disburse the funds at the proper time to the persons entitled thereto. After recording has been completed and the funds disbursed a simple statement must be prepared which will disclose to each party in detail the exact result of the transaction. This statement should be as simple as the details of the transaction will permit and should briefly identify each item entered therein. After closing it is the duty of the escrow agent to see that all documents described in the instructions are delivered to the party properly entitled thereto.

In a real estate transaction the function of the escrow agent will necessarily be very closely related to the title insurance company. The purchaser will usually be furnished with a preliminary report showing the condition of the title to the lands in question prior to the time the funds are deposited and the purchaser's instructions will usually enumerate the exceptions or encumbrances which will be permitted to remain on closing. In order to insure compliance with the purchaser's instructions the escrow agent will find it necessary to cause the records to be reexamined at the time of closing and after closing to deliver the necessary title insurance policies provided for in the instructions.

LICENSE REQUIRED

The 1963 Legislature created a new provision in the real estate law to require the licensing of escrow agents.

The license provisions do not apply to the following:

1. Any person doing business under the laws of this state or the United States relating to banks, mutual savings banks, trust companies, savings and loan associations, common and consumer finance companies, industrial loan companies, or insurance companies.
2. An attorney at law rendering services in the performance of his duties as attorney at law.
3. Any person whose principal business is that of preparing abstracts or making searches of title which are used as a basis for the insurance of titles by a company doing business under ORS 748.010 to 748.090.
4. Any firm or corporation lending money on real or personal property and which firm or corporation is subject to licensing, supervision or auditing by a federal or state agency.
5. Any person doing any of the acts specified in the definition of "escrow" under order of any court.

At the time of filing an application with the Commissioner for an escrow agent's license, the applicant must deposit a corporate surety bond in the amount of $25,000.

Fees for an original license and each annual renewal are set at $100 for the principal office and $35 for each branch office. At the time of making application for a renewal of license, the applicant must submit a satisfactory independent audit by a certified public accountant.

The Commissioner is given broad authority upon which to base a denial of license, or a suspension.

Q. 41 When a title company issues an ALTA policy, it customarily extends the risks normally insured against under the standard policy to include all but which one of the following:

(A) rights of parties in possession
(B) unrecorded physical easements
(C) the effect of zoning regulations
(D) unrecorded mechanics' liens

Q. 42 A lender of money on real property should know that his mortgage is an enforceable lien. He can best accomplish this by:

(A) recordation
(B) a mortgagee's title insurance policy
(C) providing for an acceleration clause
(D) a physical inspection of the property

THE USE OF REAL ESTATE DOCUMENTS

To comply with the Statute of Frauds, the completion of a real estate transaction depends upon the proper preparation of the listing agreement and the earnest money receipt. The listing agreement is your employment contract in writing, employing you to sell and, in turn, obligates your employer to pay compensation for your services.

The earnest money receipt is first an offer to purchase. When accepted and signed by your employer it becomes a contract binding all parties to the transaction. A well prepared listing agreement and earnest money receipt is your best insurance for a satisfactory closing. When carelessly prepared and not complete these documents become the source of most of your difficulties and complaints.

A thorough knowledge of the three documents in general use in all real estate transactions marks the competent and successful real estate practitioner. An error or uncertainty on the part of the broker or salesman may cause the transaction to collapse.

No matter how the title closing is conducted—by the broker, or in escrow by a title insurance company, or by an attorney—knowledge of the mechanics of the Closing Statement can often avoid losing a hard-earned commission.

A frequent review of the material in this Section is highly recommended.

Listing Contracts

A listing contract is a contract between a real estate broker and the owner or seller of a parcel of real estate. This contract, in order to be valid, is signed by the seller and by the real estate broker. This contract, therefore, is binding only upon the seller and the real estate broker. In some instances, a real estate broker authorizes his salesmen to accept or sign a listing contract as the agent of said broker. This act by the salesman, however, is a permissive act specifically authorized by the real estate broker. It does not change the meaning or force and effect of this contract. In a normal listing contract, a real estate broker obligates himself to use his best efforts to find a purchaser for the property involved. In consideration for this promise, the seller agrees to pay the broker a specified commission and in some instances may also grant to the broker the exclusive right to sell said real estate. In other words, in an exclusive contract the seller is permitting this broker to work on the sale of this property alone and bars all other brokers from working on the sale of this property. The seller can, however, make provisions in his listing contract to provide that a commission shall not be paid if the property is sold to certain specific individuals or, in some cases, if the property is sold by the seller himself.

In addition, the listing contract places certain other responsibilities and duties upon the real estate broker, such as retaining monies in a trust account and places certain duties upon the seller, such as furnishing abstract of title or title insurance and marketable title. Since this contract consists of mutual consideration between the broker and seller, this contract is a personal contract between these two parties and does not become the property of a third person. In other words, a salesman who solicits and receives a listing contract does so as an agent of the broker and the listing contract in no way becomes the property of the salesman but is strictly the property of the broker. Under the contract the real estate salesman does not incur any obligations to perform the advertising or selling of this property and does not sign this contract except as the agent of the broker. The broker, on the other hand, is obligated to use his best efforts to advertise and attempt to sell the real estate involved. His failure to perform under this contract could result in his being sued for damages, if damages were incurred by the seller by reason of the broker's failure to perform under the contract. Consequently, the practice of securing numerous listing contracts to tie up real estate and a failure to use the best efforts available to find a purchaser might constitute a dangerous practice for the broker to follow. It has always been advocated that a broker carefully select the listings that he signs and review these listings paying particular attention to the listing price to determine that it is in line with the current market price for that particular type of real estate.

A salesman, when he secures a listing contract, is securing this contract for his broker. Listing contracts constitute the stock and trade of a real estate broker and, therefore, are a valuable asset. When a salesman leaves the employ of a broker, the listing contract remains with the broker and is the property of the broker. If the broker dies or is in some other way unable to perform under his listing contract, the contract either becomes null and void in the case of death or the seller may rescind the contract on the basis that the broker is unable to perform his mutual promise and obligation under the contract. It is generally advocated that brokers establish very definite written rules with respect to the payment of any fees to salesmen in connection with listing contracts or commissions payable on the sale of real estate.

It is also strongly suggested that these written rules be printed and a copy furnished to each salesman employed by a broker.

Employment Contract or Listing Agreement

As a licensed real estate broker or salesman, your listings represent your stock in trade. The value of this contract to the broker depends upon its accuracy and completeness.

Good listings, properly prepared, represent salable stock. If the asking price is too high, or the property is not in a salable condition, you are wasting your time and the time of the owner by taking the listing. If the listing is not properly prepared you are creating a source of complaint and risking loss of good will, the broker's most valued possession.

The listing agreement is not a contract for sale of real estate. It is a contract for services.

Never take a listing over the telephone. You are aware that this contract must be signed, and that the seller has a right to the benefit of the broker's knowledge, which might influence the owner's action.

Make clear what fixtures or improvements the seller wishes included in the sale, and those he intends to withhold. A prospective buyer will rely upon your statement in this matter and an error here can lose the sale and result in loss of confidence.

Too much care can not be shown in arriving at a complete understanding of price and terms of payment. The experienced broker or salesman is aware that there is a difference between the cash price for a property and the price of the same property with a low down payment. The typical buyer is less apt to argue about purchase price if he has the down payment. Recheck your figures. How much down? How much a month?

In arriving at the selling price of a property the owner has a right to the benefit of your opinion of "market value", and frankness in a sales plan.

An example of such a discussion might sound like this: After arriving at his opinion of market value, the broker said, "I think your home will sell for a figure between $16,500 and $17,000 to someone who has about $5,000 for a down payment. We should get a first mortgage for $8,500 which means that you will be required to take back a second mortgage for approximately $3,000. If you insist on all cash, it will take longer to sell and you might have to reduce your price to $15,500. If you like, you can sell the second mortgage, but the current rate is 50% of face value."

THINGS TO LOOK FOR

Sometimes the cost of repair or renovation to place a property in condition to place it on the market can become a tax deductible expense item. The lister should be familiar with this rule.

In accepting the property as saleable merchandise, the successful lister will make a record of little things that might cause later embarrassment when showing the property.

Is the furnace working? Is the hot water heater sound? Is the electric stove, the garbage disposal, and all electric outlets in usable condition? Should some minor painting or cleaning up be suggested?

Some very successful listers are keenly aware that an empty house accentuates defects. They seriously look into the possibility of putting in some furnishings which will be included in the sale price.

HELP FROM TRADE-IN PROGRAM

Offices using a guaranteed trade-in program have a valuable tool in obtaining listings.

The trade-in program guarantees the seller he will not be paying the expenses of two properties at the same time, and that he can have his equity in cash when he needs it. It can also be used to get listings by showing to the seller that a potential buyer with another home to sell can be sure of having cash for the new purchase.

One beneficial side effect of the trade-in program is the fact that the lister or his office is risking his own money, and cannot afford the luxury of unrealistic listings. The result is an important ingredient to a successful sale—a merchantable listing.

Careful use of the program results in lower sales costs, greater profits, many referrals and repeats, and captive buyers.

If you are knowledgeable of the facts of the real estate market, it is entirely possible that a property owner who answers "no" to a question as to whether he would consider selling is really saying "tell me more".

FORM OF CONTRACTS

In Oregon there are four working arrangements in general use by the brokers. Standard printed forms are available for "Exclusive Right-to-Sell" and "Non-Exclusive" employment contracts. The infrequent use of "Exclusive Agency" and "Net Listings" contracts does not justify the issuance of printed employment contracts.

All Broker's Employment Contracts have three things in common.

(1) The agreement must be in writing.
(2) All contracts of employment must contain a definite termination date.
(3) A legible copy of the signed listing must be supplied to the seller.

"EXCLUSIVE RIGHT-TO-SELL" EMPLOYMENT CONTRACT

Grants to the listing broker an absolute, sole and exclusive right to sell or exchange the described property, and some contracts provide that in the event of any sale made by the seller or any other person, exchange or conveyance of the property, or any part thereof, during the term of the broker's employment, or in case the broker's authority is withdrawn prior to the expiration date, the seller agrees to pay a commission to the broker just the same as if the broker had actually consummated a sale. (See comment under Excerpt 14, this section.)

This type of employment is the most desirable as it enables the broker to freely advertise and show the property. Upon procuring such a listing the broker is duty bound to exert his every effort through advertising, posting and showing, in an endeavor to consummate a sale for his principal.

"EXCLUSIVE AGENCY" EMPLOYMENT CONTRACT

The seller grants to listing broker the right to sell the property for a specified period of time, to the exclusion of any one other than the seller. If the seller consummates a direct sale without the assistance of the listing broker—no commission is payable.

"NON-EXCLUSIVE" EMPLOYMENT CONTRACT

The seller reserves the right to sell or list the property with any other broker. Also known as an "open listing."

"NET LISTING"

Not in general use, resorted to only when the seller insists he wants a stipulated net amount. The contract specifies the net price the seller is to receive, and any amount obtained over and above the seller's net price is the broker's commission. "Net listings" are prohibited by law in several states and where used frequently are the cause of disputes and law suits.

OPTIONS

Option agreements with right of assignment, or irrevocable options, are sometimes used by brokers in lieu of "net listings." It is required that the broker in taking such options, disclose to the seller that he is taking the option as a broker, with the intent of subsequently selling and assigning the option to a third person for profit. There are many dangers in this type of listing or option arrangement and the use of same is not recommended by the Board.

USE OF ESPECIALLY DESIGNED FORMS OF LISTINGS

Oregon brokers and salesmen are fortunate in having available standard printed forms for almost all types of listings.

The Oregon Real Estate Board does not recommend the forms of any particular publisher, however, it does recommend to you the use of good standard printed forms which have been especially designed for the listing of various types of property. The selection and use of the proper type of listing will assist in calling to your attention important financial and physical features of the property which might otherwise be overlooked.

STUDY OF THE DOCUMENTS

The following text breaks down each real estate document by paragraph and term, with an explanation as to how and why they apply. Stevens-Ness forms are used because of their wide use throughout the state and are the forms used in the Real Estate Examinations.

A problem is presented regarding a real estate transaction similar to those used in the examination. The problem is carried forward to the illustrated forms as they apply. On the left hand side in the text is an "excerpt number." You will also find this excerpt number in the same position in the problem and on the illustrated documents. If you will follow each excerpt number from the problem to the text to the illustrated form there appears to be no reason why you should not be able, in an actual real estate transaction, to complete these forms in a satisfactory manner.

For study purposes the sample form of "Real Estate Broker's Employment Contract" appearing in this section has been divided into 19 parts by marginal numbers which will indicate where the excerpt under discussion is located.

DESCRIPTION

EXCERPT 1.

"REAL ESTATE BROKER'S
EMPLOYMENT CONTRACT"
Residential Property

"Description: Lot 6, Block 10, Yew Park Addition, Marion County, 280 Yew Park Drive, City of Salem, State of Oregon; for better description see owner's title deed on record, now made a part hereof. For personal property, if any to be included in property offered for sale for price next mentioned, see below or see signed inventory, to be attached."

If possible, insert the legal description of the property. Such description can be procured from an inspection of the owner's deed, deed records at the County Court House or from your local Title Insurance Company.

On city property the designation by street address and the size or approximate size of the lot will, under most circumstances, prove sufficient provided of course that the names of the City and State wherein the property is located are properly shown.

One of the problems oft times encountered is where the seller is disposing of his home together with an adjacent lot. In such cases the broker or salesman can describe the property by giving the street address of the house and then adding a description of the vacant property adjacent thereto. The Oregon Supreme Court in an early decision laid down the rule that a sufficient description was one whereby:

> A surveyor, with a deed or other written instrument before him, can locate the property and establish the boundaries (6 Oregon 175).

The words "for better description see owner's title deed on record, now made a part hereof", incorporate into the listing the deed records in the County Court House. Were the test, as laid down by our Supreme Court, to be applied to an incomplete or faulty description—such a reference would enable the surveyor to consider the description shown on the deed records. The clause will not cure all incomplete or faulty descriptions—it may assist in curing some.

SELLING PRICE AND TERMS

EXCERPT 2. "Selling price, free of encumbrances: **$15,500.00;**

Terms: **Mortgage may be assumed by purchaser and credited on purchase price.**

(a) The words "free of encumbrances: **$15,500.00**" does not necessarily indicate that the property is unencumbered by mortgage, contract balance or lien. It does mean that the broker's ultimate commission is to be based not upon the interest that the seller **may have** in the property, but upon the full sale price **just as if** the property were "free of encumbrances" at the time of listing.

(b) The "terms" should be explicit. If the seller is wanting cash for his equity with the buyer assuming encumbrances, it should be so stated. It might be weeks or months before a buyer is secured and the equity might be changing from month to month. If the seller will sell for $500 or $1,000 cash and definite terms on the balance, it should be clearly stated.

INVENTORY OF CHATTELS

EXCERPT 3. "Is signed inventory attached as part hereof? Yes .....; No .....; to be attached as part hereof? Yes .....; No ....."

If chattels are too numerous to list in Item 9 below, complete in duplicate an inventory of the chattels to be included. Attach one copy of the inventory (signed by the seller) to the broker's and seller's copies of the Employment Contract. Indicate at this point that

such an inventory has been supplied and by reference becomes a part of the contract. If items of personal property to be included in the sale are of material value that value should be stated on account of U. S. Revenue Stamps to be attached to the deed, fire insurance and perhaps other reasons.

NAME OF BROKER

EXCERPT 4. "To .....,
Real Estate Broker

....., ..., ..., 19 ....."
City State Date

The name to be filled in above the words "Real Estate Broker" does not necessarily mean the name of the broker. It should be the name under which the broker has his Real Estate License. This is to be followed by city, state and date of contract.

COMMISSION AND PERCENTAGE

EXCERPT 5. "FOR VALUE RECEIVED, you hereby are employed to sell or exchange the property described hereon at the selling price and on the terms noted. You hereby are authorized to accept a deposit on the purchase price. You may, if desired, secure the cooperation of any other broker, or group of brokers, in procuring a sale of said property. In the event that you, or any other brokers cooperating with you, shall find a buyer ready and willing to enter into a deal for said price and terms, or such other terms and price as I may accept, or that during your employment you place me in contact with a buyer to or through whom at any time within 90 days after the termination of said employment I may sell or convey said property, I hereby agree to pay you in cash for your services a commission equal in amount to .....% of said selling price."

In the foregoing excerpt we find several phases of contract law—as well as a recitation of certain conditions which will entitle the listing broker to his commission:

(a) Recites "valuable consideration" necessary in all contracts

(b) Specifies purpose for which broker is employed

(c) Authorizes broker to accept a deposit on the purchase price

(d) Authorizes listing broker to cooperate with any other broker

(e) Seller agrees to pay a "cash" commission in the event that the listing broker:

(1) Procures a buyer at the **exact price and terms** specified by the seller

(2) Procures a buyer at any other price and on terms acceptable to the seller, and

(3) Places prospective purchaser "in contact" with the seller, during the lifetime of the employment contract, to whom the seller may sell or convey at any time within the 90-day period following the termination of the listing.

In this connection all licensees should review Rule 10-015.

The matter of "placing in touch", or similar wording, indicates more than a mere showing of the property prior to the expiration date.

The general trend of Court decisions on the 90-day protection clause has been aptly expressed as follows:

"If a broker, after introducing a prospective customer to his employer to no purpose, abandons his employment entirely or if, after procuring a person who proves to be unwilling to accept the terms of his principal, he merely ceases to make further endeavors to negotiate a deal with that particular individual and all negotiations in that direction are completely broken off and terminated, he will not be entitled to his commission if his employer subsequently renews negotiations with the same person, either directly or through the medium of another agent and thus effects a sale without further effort on the part of the broker first employed. The question as to when the broker will be deemed to have abandoned his efforts to sell depends upon the facts in the individual case. The mere fact that some time elapses after the broker has discontinued his efforts to make a sale, before the sale is made in fact by the owner, is not evidence of itself that there has been a complete abandonment of the negotiations." BROKERS SECTION 144 AMERICAN JURISPRUDENCE.

(f) The percentage figure to be inserted in ".....% of said selling price" is a matter to be determined by agreement between the seller and broker.

DEEDS, EVIDENCE OF TITLE, PRO RATING

EXCERPT 6. "I agree to convey said real estate to the purchaser by a good and sufficient deed, to transfer and deliver said personal property, if any, by good and sufficient bill of sale and to furnish either title insurance insuring or a complete abstract showing marketable title to said real estate and good right to convey. I hereby warrant that the information shown hereon below is true, that I am the owner of said property, that my title thereto is a good and marketable title, that the same is free of encumbrances, except as shown hereafter under "Financial Details" and except taxes levied on said property for the current tax year which are to be pro rated between the seller and buyer."

(a) Seller agrees to convey real property "by good and sufficient deed", meaning that he may at his option supply:

(1) Warranty Deed,

(2) Special Warranty Deed, or

(3) Bargain and Sale Deed.

The increased use of "title insurance" has materially reduced the importance of the buyer procuring a "Warranty Deed" to the exclusion of other types of conveyance, for the reason that title insurance protects the purchaser against loss (in an amount equal to the purchase price) regardless of what type of deed is supplied by the seller.

(b) Seller agrees to convey title to the personal property, if any included, by "Bill of Sale."

(c) Seller agrees to furnish, in the event of sale, evidence of marketable title by supplying:
(1) Title insurance, or
(2) Abstract of record.
If Title Insurance is to be furnished, the word "either" and the words "or a complete abstract showing" should be stricken.
At the time of taking the listing, ascertain what type of evidence of title the seller will supply. Such information will be needed when preparing the Earnest Money Receipt.

(d) Seller asserts that:
(1) He has good title and right to convey.
(2) That the information which he has supplied regarding the property is true (See Items 7 and 8).
(3) That the property is free of encumbrances except as shown under Financial Details (See Item 17).

(e) Seller agrees to pro rate current year's taxes.

EXCHANGE AUTHORIZATION

EXCERPT 7. "In case of an exchange, I have no objection to your representing and accepting compensation from the other party to the exchange as well as myself."

The sale price and terms as stipulated by the seller will not ordinarily permit the broker to attempt negotiations for sale of the property for any consideration other than cash. With the inclusion in the contract of the "exchange clause" the broker may also attempt negotiations for the sale of the property on an exchange basis—and if successful—he is authorized by the seller to divide his allegiance between the seller and the other party to the exchange.

The negotiation of exchange transactions is one of the few sets of circumstances wherein, provided his employment contract so provides, the broker may render simultantous allegiance to any one other than the seller who first employed him.

SHOWING PREMISES—INFORMATIVE DATA

EXCERPT 8. "I hereby authorize you and your customers to enter any part of said property at any reasonable time to show same. Also, I authorize you, at any time, to fill in and complete all or any part of the 'Informative Data' below, except financial details."

(a) On occasions the property listed for sale will be occupied by renters who are reluctant to permit the broker and his prospects to visit and inspect the property. In such instances the seller, under the foregoing "show" clause, assumes the responsibility of settling such difficulties with the tenants.

(b) In the majority of instances, complete information relating to both physical and financial features of the property are entered on the broker's employment contract **prior** to the procurement of seller's signature. Occasionally, however, the seller's signature will be procured when only the property description, price, terms and financial data have been noted. This leaves the broker in the position of making a subsequent inspection of the property and entering on his copy of the contract the property's physical features.

The latter part of the foregoing excerpt is designed to avert the possibility of the seller subsequently alleging that the broker, through the insertion of such information, after the affixing of seller's signature, has rendered the contract "void."

It will be noted that the broker's authority has been limited to the subsequent filling in of "Information Data." See Item 18, which relates, for the most part, to the property's physical features—available from an inspection of the premises. No authorization is given to the broker to subsequently fill in—on his own initiative—"financial information." (See Item 17.)

CHATTELS

EXCERPT 9. "The following items are to be left upon the premises as part of the property purchased: All irrigation fixtures and equipment, plumbing and heating fixtures and equipment (including stoker and oil tanks but excluding fireplace fixtures and equipment), water heaters, electric light fixtures, light bulbs and fluorescent lamps, bathroom fixtures, venetian blinds, window and door screens, storm doors and windows, attached linoleum, all shrubs and trees and all fixtures except **three patented rose bushes.** The following personal property is also included as a part of the property to be offered for sale for said price: **one G. E. automatic washer** (or see signed inventory, if any, attached)."

It is a wise broker indeed who definitely settles with the seller at the time of the taking of the listing, what chattels are or are not to be included with the sale. Particular notice should be given to chattels such as curtain rods, traverse rods and drapes, ranges, refrigerators, washing machines, deep freeze units, etc., which have not been included in the foregoing printed list. This identical clause appears in the Earnest Money Receipt Item 9, and any exceptions or additions shown in the Employment Contract must be also noted when making out the Earnest Money Receipt.

EXPIRATION DATE AND TIME TO CLOSE

EXCERPT 10. "This agreement expires at midnight on **April 6, 1968,** but I further allow you a reasonable time thereafter to close any deal on which earnest money is then deposited."

(a) As previously stated, Regulations require that every listing must contain a definite termination date. The broker's employment expires at midnight on whatever date is inserted here —however, the period of employment may be subsequently extended by the seller to a new date by using the "extension clause" (See Items 13 and 16).

(b) Occasionally sellers who have listed their property for sale will change their minds about selling, and even after a broker has

advertised and procured a buyer at seller's exact price and terms, the seller may attempt to evade the deal as well as avoid the payment of broker's commission.

In an Oregon case involving a "cash net listing" the broker's employment contract provided a definite termination date but made no provision for a reasonable time, after the termination of the broker's employment, in which to close any transaction that might be consummated prior to the termination date.

On the last effective day of the employment contract the broker was successful in procuring a buyer at the seller's exact price and terms. Broker tendered seller an earnest money receipt and deposit. The seller refused to accept the deposit and specified that he was ready and willing to tender to the buyer both a deed and abstract of title—provided the full amount of the cash purchase price ($47,500.00) was paid immediately, and he would not allow the purchaser an extension of time, following the termination date of the broker's employment contract, in which to ascertain the marketability of the title.

The purchaser rightfully refused to pay the full purchase price without an opportunity to examine the title. The broker's claim for damages was refused by the Court for the reason that he had procured a buyer "ready", "able", but not "willing" to purchase under the conditions imposed by the seller.

EXCLUSIVE RIGHT-TO-SELL OR NON-EXCLUSIVE CONTRACT

EXCERPT 11. "Any sale, exchange or conveyance of the property or any part thereof by me prior to the said expiration date or through another broker or third person without your assistance shall be construed as a withdrawal of your authority to sell the above described property."

The Broker's Employment Contract, from which these excerpts have been taken, is designed to serve as an "exclusive Right-to-Sell" employment contract. By deletion of Item 14, the broker's employment can be amended to a "non-exclusive" listing.

(a) The excerpt quoted above, when read as a part of an "exclusive right-to-sell" listing, provides certain acts that "shall be construed as a withdrawal of your (broker's) authority to sell" and must be read in conjunction with excerpt 14 below wherein it provides that if seller, prior to the contract's termination date, **withdraws the broker's authority** the seller will be liable for payment of broker's commission.

(b) If the contract is to be used as a "non-exclusive" listing and excerpt 14 is stricken, this paragraph must stand by itself and provide the conditions which shall be construed as terminating broker's "non-exclusive" listing.

EXCERPT 14. "THIS LISTING IS AN EXCLUSIVE LISTING and you hereby are granted the absolute, sole and exclusive right to sell or exchange the said described property. In the event of any sale, by me or any other person, exchange or conveyance of said property, or any part thereof, during the term of your employment, or in case I withdraw the authority hereby given prior to said expiration date, I agree to pay you the said commission just the same as if a sale had actually been consummated by you."

To eliminate possible misinterpretation, the acts of selling, exchanging, etc., recited in Excerpt 11 have been again restated.

Appendix

The weight of authority of Courts Decisions is to the effect that the seller theoretically reserves the right to cancel a broker's exclusive right-to-sell privilege at any time prior to the expiration date. Such cancellation may be either by owner's notice to broker or by sale of the property by the owner to a purchaser not procured by the listing broker.

The question then arises as to the liability of the seller and the amount of damages, if any, to which the broker is entitled where the broker has not, prior to cancellation, expended any monies, exerted any effort or procured a buyer ready, willing and able to purchase.

A survey of Supreme Court Cases discloses that in the majority of instances that the broker's employment contracts were silent regarding the broker's rights and the seller's liability in the event of cancellation. In these cases the courts were rather consistent in holding that all the broker was entitled to recover was the amount which he had expended in the seller's behalf prior to the cancellation.

By contrast however the Courts held that broker's using employment contracts which provided that the broker would be entitled to his full commission "in the event of any sale prior to the expiration date" were able to recover their full commissions, rather than sum equal to their expenditures. (See American Law Reports vol. 64, page 416.)

The contract shown in Excerpt 14, goes further and provides: "or in case I withdraw the authority hereby given prior to said expiration date, I agree to pay, etc."

This is new verbiage and as yet there have been few, if any cases, carried to the Supreme Courts. The trend thus far seems to indicate that where the wording is clear in its intent that notice of cancellation will entitle the broker to his full commission "just the same as if a sale had actually been consummated."

One of the primary and determining factors running through all cases was the question as to whether the broker had in fact exerted time, effort and expended monies in the seller's behalf.

EXCERPT 12. "In case of suit or action on this contract, I agree to pay such additional sum as the Court may adjudge reasonable as Plaintiff's attorney fees."

This is a common clause found in most contracts. No attorneys fees are collectible except where actions are adjudicated in Courts of Law and fee is approved by trial Judge.

The mere filing of an action for breach of contract will not be sufficient to make this clause enforceable.

EXTENSION OF EMPLOYMENT DATE

EXCERPT 13. "It is further agreed that my signature affixed to the renewal clause below shall have the effect of renewing and extending your employment to a new date to be fixed by me on the same terms and all with the same effect as if the said new date had been fixed above as the expiration date of your employment."

Excerpt 10 provided that every listing must contain a definite termination date but could be subsequently extended to a new date by procuring seller's signed approval (See Excerpt 16).

EXCERPT 16.

Accepted: **January 6, 1968**
A. Broker

JOHN SELLER (SEAL)
MARY SELLER (SEAL)
owner

Owner's Address **280 Yew Park Drive** City **Salem** State **Oregon** Phone **363-8442.**

The date of acceptance in most cases is the same as the listing and should be signed by the broker or a salesman may sign the acceptance thus: A. Broker by Roy Hart.

FOR VALUE RECEIVED, the above broker's employment hereby is renewed and extended to and including ....., 19.....

Accepted: ....., 19.....

.....
Broker

.....(SEAL)
.....(SEAL)
Owner

DELIVERY OF COPY OF LISTING TO SELLER

EXCERPT 15. "I HEREBY CERTIFY THAT I HAVE RECEIVED A CARBON COPY OF THIS CONTRACT."

Board Rules and Regulations provide:

"A broker or salesman who obtains a listing, at the time of securing such listing, shall give the person or persons signing such listing a true copy thereof."

FINANCIAL DATA

EXCERPT 17. This should be as complete as possible. Price and terms as stated above. Space is provided to indicate if the payment includes principal, interest, taxes, insurance and the interest on deferred payments. The next item is the amount of fire insurance and the fire insurance premium. If the premium is for 3 years, cross out the word "annual" and write "3 years."

The next item is "Taxes last year." This is misleading. Taxes are on a fiscal year basis. Cross out the word "last" and show the fiscal year, viz. 1967-68, and the amount.

The next space is for Federal Housing Administration Commitment if there is one.

The next spaces are for encumbrances, or indebtedness which the owner owes or which must be paid if the owner was to give a clear title to the property. This can be in the form of mortgages, trust deed, taxes, municipal liens such as paving, etc., or it might be the owner is buying on a Contract of Sale. Under the item "delinquent taxes", you should remember that taxes owing for the fiscal year in which you take the listing may be past due, but do not become delinquent until August 16 following the fiscal year.

INFORMATIVE DATA

EXCERPT 18. That portion of the form used for Informative Data has not been completed in the sample form illustrated, but an accurate and complete filling in of this part is what makes a good listing. "B" means basement, "1F" first floor, "2F" second floor, "A" attic. These spaces should be as complete as possible. Use numerals and the words "yes" and "no", rather than an "X" or a check mark. For example: Bedrooms: first floor 1, second floor 3; comment large closets; Basement full—yes.

Space is provided for important information which includes street number of the house situated on the lot in the block described in the listing.

If all spaces are filled in you have a valuable listing.

If you secure additional information for which no space is provided, place it under the heading "Remarks."

Notation should be made if you are permitted to put up a sign. The name of the party who inspected the property should be shown.

EXCLUSIVE RIGHT-TO-SELL OR NON-EXCLUSIVE

EXCERPT 19. "*TO MAKE NON-EXCLUSIVE—Strike complete Paragraph following (*) in Employment Contract and have owner initial the deletion." For discussion see Excerpt 11.

Listing Agreement Problem

Compare this information with the text and the illustrated form.

4 A. Broker, 1020 A Street, Salem, Oregon, ob-
14 tains a three-months exclusive right to sell the hereafter described property.

16 **Owners:** John Seller and Mary Seller, husband and wife, 280 Yew Park Drive, Salem, Oregon, Phone 364-8442.

Date of Listing: January 6, 1968.

Terms of Listing: Expires April 6, 1968.

Listing Accepted: January 6, 1968.

6 **Commission:** 6%

1 **Legal Description:** Lot 6, Block 10, Yew Park Addition to the City of Salem, Marion County, Oregon.

Property Address: 280 Yew Park Drive, Salem, Oregon.

2 **Listing Price:** $15,500.00.

2 **Terms:** Cash for equity, buyer to assume mortgage.

17 **Taxes:** The taxes for 1967-68 on the property were $192.00. Paid in full.

RESIDENCE PROPERTY

FORM No. 674 COPYRIGHT BY STEVENS-NESS LAW PUB. CO., PORTLAND, OREGON

REAL ESTATE BROKER'S EMPLOYMENT CONTRACT

1 DESCRIPTION: Lot 6, Block 10, Yew Park Addition, 280 Yew Park Drive

City of Salem, County of Marion, State of Oregon; for better description see owner's title deed on record, now made a part hereof. For personal property, if any to be included in property offered for sale for price next mentioned, see below or see signed inventory, to be attached.

2 Selling price, free of encumbrances: $ 15,500.00; Terms Cash for equity, buyer to assume and agree to pay mortgage of record payable $85 per month including interest at 6%

3 Is signed inventory attached as part hereof? Yes ____; No X; to be attached as part hereof? Yes ____; No ____

4 To A. Broker, 1020 A Street (Real Estate Broker), Salem (City), Oregon (State), January 6, 19 68

5 FOR VALUE RECEIVED, you hereby are employed to sell or exchange the property described hereon at the selling price and on the terms noted. You hereby are authorized to accept a deposit on the purchase price. You may, if desired, secure the cooperation of any other broker, or group of brokers, in procuring a sale of said property. In the event that you, or any other brokers cooperating with you, shall find a buyer ready and willing to enter into a deal for said price and terms, or such other terms and price as I may accept, or that during your employment you place me in contact

6 with a buyer to or through whom at any time within 90 days after the termination of said employment I may sell or convey said property, I hereby agree to pay you in cash for your services a commission equal in amount to 6 % of said selling price. I agree to convey said real estate to the purchaser by a good and sufficient deed, to transfer and deliver said personal property,

7 if any, by good and sufficient bill of sale and to furnish [redacted] title insurance insuring [redacted] marketable title to said real estate and good right to convey. I hereby warrant that the information shown hereon below is true, that I am the owner of said property, that my title thereto is a good and marketable title, that the same is free of encumbrances except as shown

8 hereafter under "Financial Details" and except taxes levied on said property for the current tax year which are to be pro rated between the seller and buyer. In case of an exchange, I have no objection to your representing and accepting compensation from the other party to the exchange as well as myself. I hereby authorize you and your customers to enter any part of said property

9 at any reasonable time to show same. Also, I authorize you, at any time, to fill in and complete all or any part of the "Informative Data" below, except financial details. The following items are to be left upon the premises as part of the property purchased: All irrigation fixtures and equipment, plumbing and heating fixtures and equipment (including stoker and oil tanks but excluding fire place fixtures and equipment), water heaters, electric light fixtures, light bulbs and fluorescent lamps, bathroom fixtures, venetian blinds, window and door screens, storm doors and windows,

attached linoleum, attached television antenna, all shrubs and trees and all fixtures except 3 patented rose bushes. The following personal property is also included as a part of the property to be offered for sale for said price: 1 G.E. automatic washer

10 ____ (or see signed inventory, if any, attached). This agreement expires at midnight on April 6, 19 68, but I further

11 allow you a reasonable time thereafter to close any deal on which earnest money is then deposited. Any sale, exchange or conveyance of the property or any part thereof by me prior to the said

12 expiration date or through another broker or third person without your assistance shall be construed as a withdrawal of your authority to sell the above described property. In case of suit or action on this contract, I agree to pay such additional sum as the court may adjudge reasonable as plaintiff's attorneys fees. It is further agreed that my signature affixed to the renewal clause below shall

13 have the effect of renewing and extending your employment to a new date to be fixed by me on the same terms and all with the same effect as if the said new date had been fixed above as the expiration date of your employment.

14 *THIS LISTING IS AN EXCLUSIVE LISTING and you hereby are granted the absolute, sole and exclusive right to sell or exchange the said described property. In the event of any sale, by me or any other person, exchange or conveyance of said property, or any part thereof, during the term of your employment, or in case I withdraw the authority hereby given prior to said expiration date, I agree to pay you the said commission just the same as if a sale had actually been consummated by you.

15 I HEREBY CERTIFY THAT I HAVE RECEIVED A CARBON COPY OF THIS CONTRACT.

Notice to Brokers and Salesmen

The most important document that will be prepared in your office is the Earnest Money Receipt. A large percentage of all complaints filed with this division, and many lost sales, are the results of these forms being improperly prepared. Every licensed employee in a broker's office should have the ability to prepare one properly before he is permitted to sell. Lack of this ability may result in disciplinary action by this division, loss of commission on the transaction, and last but not least, loss of public acceptance of the real estate practitioner.

The Earnest Money Contract is the foundation on which a sale of real estate is constructed. (You may look upon the listing contract as such, but that is only the employment contract wherein you were employed to secure a purchaser. *It is not an agreement to sell.*)

The entire transaction will be firm or shaky depending on the foundation you lay in the Earnest Money Contract.

The seller or buyer have the right to expect that a transaction will be completed exactly on the terms and conditions to which they have agreed—NO MORE and NO LESS. They also have the right to expect that, if necessary, they can maintain a legal action to enforce the contract.

The professional real estate practitioner makes certain that the Earnest Money Contract is legally correct as to contents; that all things to which each party has AGREED AND IS COMMITTED are contained in the contract, that it is properly signed by all parties with any changes, modifications, or alterations, being properly initialled, and promptly delivers executed copies to all parties. He leaves no little "surprises" to be brought up for the first time at the closing, such as fuel oil adjustment, prepayment penalties, mortgage discounts, appraisal fees, taxes, or pending assessments.

Nothing reflects more adversely on the real estate practitioner than the misspelling of commonly used words, or an excessive use of abbreviation.

Are *you* a professional or a non-professional? You don't really need to answer—your Earnest Money Contract will speak for you.

If you will carefully review the text in this section and observe the following suggestions, the licensee should not have further difficulty in this most important part of his business.

(a) Your relation with your principal always demands absolute fidelity.
(b) You should always endeavor to collect earnest money substantially in excess of your commission.
(c) The earnest money receipt must be prepared in quadruplicate. A copy of the earnest money receipt signed by all parties must be delivered to both the purchaser and the seller at once if the offer is accepted. One of the copies provides a receipt for the purchaser at the time he makes his offer and earnest money deposit. The original copy is to be retained in the broker's file.
(d) A salesman must promptly turn over to his broker all client's funds entrusted to his care.
(e) A broker, as provided by law, must establish a trust account as a depository for all client's funds in his possession.
(f) Check carefully your description of the property involved.
(g) Ascertain that all signatures, including your own, are affixed in the space provided.
(h) Have no oral understandings. Make sure that every understanding on the part of either party is a part of the written agreement.
(i) Any change of the earnest money receipt after the signatures have been affixed, which is agreed to by the parties, must be added as a part of the agreement and be initialed by all parties. It is well to include the date and hour such a change was made.

An earnest money receipt becomes a contract and as such must contain certain essentials. Here is a check list:

Be in writing.
Competent parties.
Identify the parties.
Obligation to sell and to buy.
Description of the land.
Price and terms of payment.
Nature of the title (good and marketable).
Instrument of conveyance (type of deed).
Time for performance (closing).
Prorating interest, taxes, insurance, rents.
Your commission in dollars and cents.

Status of Earnest Money

What is the status of earnest money held by a real estate broker?

When the purchaser pays the earnest money, the broker becomes a trustee for the purchaser, as it is the duty of the broker to account to the purchaser for the earnest money up to the time that the broker has secured from the seller a binding acceptance of the transaction. When the broker does secure a binding acceptance from the seller, he then becomes a trustee for both the buyer and seller. It may become his duty to account to the buyer in the event the seller is unable to make good title to his property or defaults on the contract, and it will be necessary for the broker to account to the seller in the event of a forfeiture of

the earnest money or in the event the parties consummate the transaction.

Brokers must keep in mind the fact that they are holding this earnest money as trustees and as such are obligated to all of the parties concerned to keep the earnest money intact, so that the broker will be in a position to account for the same. In other words, a broker should not pay any of this earnest money to the seller or to any one else, until and unless the transaction is closed or the earnest money forfeited. Also, by all means, the broker should not pay himself his commission out of this earnest money until the transaction is consummated or the earnest money forfeited.

DESCRIPTION OF PROPERTY IN EARNEST MONEY RECEIPTS

There is a tendency of real estate brokers to be careless in the describing of property in earnest money receipts and listing agreements. Unless the property being sold is so described in the instrument that the requirements of the law are fully met, it is not an enforceable agreement.

We find a good illustration of this in the decision of the Supreme Court of the State of Oregon in the case of Hertel v. Woodard, 183 Or. 99. The earnest money receipt in question read substantially as follows:

"May 10, 1947

Received from Lucky Hertel $80.00 Eighty Dollars earnest money on lot & house number 960 Union Street. Price $5,000.00 Five Thousand and—balance of $4,920.00 to be paid when papers and title insurance are completed. It is understood this deal would be closed and house vacated on or before June the 10th. All furniture except personal belongings included in this transaction."

An examination of this earnest money receipt discloses that there is no mention made of the city, county or state in which the property is located. It appeared from the pleadings and in the trial of the case that the earnest money receipt was signed while all of the parties thereto were in the house which was covered by the earnest money receipt, and it was contended that because of this that there could be no room for misunderstanding between the parties as to the location of the property.

The Supreme Court held that because of the failure of the earnest money receipt to state the location of the property in that there was not contained therein the name of the town or state in which the property was located, that the earnest money receipt was void and unenforceable.

A good test to be applied to determine the sufficiency of the description of property is whether a stranger to the instrument, having no knowledge whatsoever with respect to the location of the property, could take the instrument and from the information given therein locate the property. It must be kept in mind in determining the sufficiency of the description that it makes no difference that the parties themselves were fully agreed as to the property which the scrivener of the instrument intended to describe. The instrument must stand on its own feet and if the description contained therein is insufficient to enable a stranger to the intsrument, who has no knowledge of the transaction, to locate the exact property, this description will be held insufficient to comply with the requirements of the Statute of Frauds.

Earnest Money Receipt

The term "earnest money" refers to the money paid by the prospective purchaser at the time of making his offer to purchase. This actual deposit will hereafter be referred to as "hand money" for the purpose of distinguishing the actual deposit from the "Earnest Money Receipt", which is sometimes referred to as "Earnest Money Receipt and Argeement to Purchase" or "Earnest Money Contract", and much more frequently as "Earnest Money Agreement."

The actual "hand money" placed on deposit with the broker or salesman, is promptly deposited by the broker in his trust account where he holds it subject to the owner's acceptance of the purchaser's offer.

The factors that make the "Earnest Money Receipt" form so important are that it is: (1) a receipt for the "hand money" deposited; (2) it must contain a written understanding of all of the basic factors which are to be included in the subsequent contract of sale or purchase money mortgage arrangement; (3) it serves as a contract of sale on cash transactions up to and until the date of closing; (4) it must contain a complete understanding as between the purchaser, owner and broker as to return of the hand money deposit in the event of the refusal of the seller to accept the offer; and (5) forfeiture of the hand money in the event that the purchaser fails or neglects to go forward with the transaction following the seller's acceptance.

LAWYER COOPERATION

Frequently a real estate transaction is closed by an attorney. If he is a competent lawyer he will probably use a check list in drawing up the final contract. Respect for your ability will be furthered if the probable items on this check list are included in the earnest money receipt or supplied as an addenda. His check list will probably include these items: consideration and manner of payment, payment of balance of purchase price, interest provisions, prepayment privileges, taxes, insurance, possession, improvements, alteration and repairs, title insurance, covenants of title, escrow, delivery of deed, risk of loss, default provisions, representations (purchaser certifies he has examined property), waivers, assignments, successor interests, closing.

STUDY OF THE EARNEST MONEY AGREEMENT

The sample form of the earnest money receipt shown in this section is a one-time carbon manufactured in quadruplicate (original and three copies); one copy is delivered to the purchaser at the time he signs the "Agreement to Purchase" portion of the Earnest Money form and tenders his hand money deposit; another copy is delivered to the seller at the time he accepts the offer; the third copy showing "Seller's Acceptance" is delivered forthwith back to the purchaser (this delivery can be made either manually or by registered mail with request for postal

return receipt to broker); and the original copy, as shown, is retained by the broker and contains all the terms, conditions, signatures of the buyer and seller, as well as a showing of the manner in which the broker elected to use in returning the "acceptance" copy to the buyer. The delivery of this "acceptance" copy places the buyer upon actual notice that his offer to purchase has been accepted.

For study purposes the sample form, as shown, has been divided by marginal numbers into 16 component parts. These numbers compare with those assigned to the following discussion:

(1) Entry of correct place and date(s) is of utmost importance, for it is from these controlling dates that time limits will be determined for the happening of the successive chain of events requisite in every real estate transaction.

(2) Enter name(s) of only the person(s) who will sign the "Agreement to Purchase." If the husband is the one who inspects the property and pays you the earnest money and his wife is not present to confirm the offer, only the husband's name should be used.

(3) The amount of earnest money should be filled out both in spelling and numbers, (One Thousand & no/100 Dollars and $1,000.00) just as you would write a check, and state if said sum is in the form of cash, check or draft, or note.

(4) After filling in the name of the City, County and State you should enter the complete legal description of the property to be sold. If space is insufficient on the form to include a metes and bounds description, it is advisable to write on the face of the Earnest Money form the words "see legal description attached hereto marked 'Exhibit A' and by reference made a part hereof" and then affix a rider containing a complete property description marked "Exhibit A" to all four copies of the form. The complete property description may be written on the reverse or blank side of the form and the cross reference words written on the face "for complete property description see reverse hereof." It is recommended that all four copies of the attached rider or description appearing on the back of the forms be initialed or signed by both buyer and seller.

Another method of handling a long legal description is to identify the property "as described on Page ....., Volume ....., Deed Records, ... County, Oregon"; or "as recorded ..... day ..... year, Reel ....., Clerk's Filing No. ....., ... County, Oregon, Deed Records."

Correct legal descriptions are available from the Deed Records in the County Court House or from your local title insurance company. Some brokers who have failed or neglected to procure in advance the correct legal description and insert the words "legal description to be added later" are inviting disaster.

(5) The purchase price and terms of sale must be complete in all details. The line "(on ....., * (on owner's acceptance) 19..... as additional earnest money, the sum of $....." is used only in instances where the broker accepts a partial hand money payment at the time of procuring the buyer's offer and then arranges for additional hand money to be paid on a certain date, or upon the owner's acceptance. Later on in this discussion we will find provision is made for the forfeiture of the "earnest money" in the event that the purchaser fails or neglects to go forward with the transaction. The only money required to be forfeited is the money designated as "earnest money" and any money paid down and not so designated may be construed as a down payment made on the purchase price, which under the terms of the contract, is not forfeitable.

In this same part of the form we show how the balance of the purchase price is to be paid. If an existent contract or mortgage is to be assumed as a part of the purchase price we show the balance payable, terms of payment and whether the interest, taxes and insurance are included as a part of the monthly payment, which is also shown.

It is quite possible there may have been several other conditions in the offer and no space on the Earnest Money Receipt for them. When this occurs, they should be written in full on the back of the form and initialed by the buyer and seller or listed separately and made a part of the agreement.

(6) If title insurance is to be furnished, the entire sentence regarding abstract of title should be deleted. Delivery of evidence of title by the owner to the broker does not constitute delivery to the purchaser. It is therefore necessary that the broker promptly, upon receipt of the seller's evidence of title, deliver it "forthwith" to the purchaser for his examination.

(7) Here we find a most important clause of the Earnest Money form, for it provides that the purchaser shall have a reasonable time in which to examine the seller's evidence of title and the seller shall have 30 days in which to clear any "clouds" upon the title in order to make the title marketable. The paragraph also contains provisions as to return or forfeiture of the earnest money deposit.

(8) Provides that the seller is to convey the property by good and sufficient deed free and clear of all encumbrances, except for certain enumerated items that shall not be considered as encumbrances on the title. Space is then provided for the insertion of any balances on liens, mortgages or taxes which are due and owing and which are to be assumed and paid by the purchaser.

In this blank space should be filled in those items of indebtedness which are a lien on the property at the time of the sale and are not being removed by the sale, but are to be paid by the buyer in the future and are to be listed on the Deed which the buyer will receive as an indebtedness against the property. It should clearly state whether the buyer is taking title "Subject" to the indebtedness, or if the buyer is "Assuming" the indebtedness.

(9) The first space is for the chattels that are excepted from the sale, and the following space for inclusions. Particular care should be taken in inserting into the Earnest Money receipt any exceptions or additions shown in the original signed listing.

(10) Seller and Purchaser agree to the pro-rating of taxes, rents and existing insurance and provide that any encumbrances now existent upon the property and payable by the seller on or before closing may be paid out of the purchase money at the date of closing.

(11) Insert the date when the purchaser may

take actual possession of the premises. The accuracy of the date is usually determined by checking the Broker's Employment Contract and ascertaining how much time the seller specified at the time of listing would be required to vacate the premises in event of subsequent sale. The accuracy of the date which you place in the Earnest Money form will, to a large measure, determine what commitments the purchaser will make regarding the premises which he is leaving or as to how soon he will have to give his landlord notice—or promise occupancy to a third party buyer of his present home. The form then goes on to provide that time is of the essence of the contract and that the purchaser's rights are not assignable.

(12) Enter name of broker on top line in the same manner in which it is shown on the Real Estate License Division records. This eliminates the possibility of subsequent contention that the Earnest Money form failed to show the proper party having a real estate broker's license. On the next line following the word "By" enter the name of the broker or salesman who prepared the Earnest Money form.

(1–13) Enter date on which purchaser's signature is procured, also the full purchase price and number of days which the purchaser agrees to grant the broker for the procuring of the seller's acceptance, during which time he (the purchaser) agrees not to withdraw or revoke his offer. Under the General Law of Contracts and our trend of decisions by the Supreme Courts, it has been held that the purchaser may withdraw his offer at any time prior to the seller's acceptance and procure back his deposit. The number of days entered here also refers back to Item 7 in the Earnest Money form wherein it states "within the period allowed broker below in which to secure seller's acceptance."

The broker should by all means exert every effort to procure the seller's acceptance at the earliest possible date and not dilatorily wait out the time limit or hold the original offer pending in the hope of procuring a subsequent offer from a third party at a higher price or on better terms.

Next is entered the name(s) of the person(s) to appear in the Deed or in the contract as purchaser(s), and have the agreement to purchase signed by the same person(s) as appear in Item 2 of the Earnest Money form. Upon procuring signatures and hand money deposit, the broker or salesman delivers to the purchaser(s) a copy of the Earnest Money form, completed up to this point and prepares to seek the seller's acceptance of the offer.

(1–14) Agreement to Sell: Enter here the date on which seller's signature is procured. The accuracy of this date will control the forfeiture of the entire hand money deposit in the event that the purchaser should subsequently elect to withdraw his offer (see Items 7 and 13). If the sellers are husband and wife, even though the property is held in the individual name of one of the parties, be sure to procure both signatures—for by so doing they bind themselves to subsequently execute the deed as provided for in the contract. Failure to procure both spouses' signatures has resulted in one spouse subsequently defeating the transaction by refusing to sign the deed and thereby convey their respective dower or curtesy interest.

(15) Agreement to pay Commission: Enter the amount of your commission in dollars and cents. Do not enter "6% of selling price" for if it should subsequently develop that your seller is unable to supply marketable title, the hand money would be returned to the buyer and the broker's efforts would result in "no sale." Simple mathematics will show that 6% of "no sale" will equal no commission. By inserting the amount of commission in dollars and cents there can be no misunderstanding as to amount of money which the seller has obligated himself to pay for broker's services; payable even though the owner is subsequently unable to deliver marketable title.

The following forfeiture clause refers back to the forfeiture mentioned in Item 7 of the Earnest Money form, and provides that the broker shall retain out of the hand money forfeited to the seller, the full extent of his agreed upon commission with residue, if any, over to the seller as liquidated damages.

Procure here signatures of all parties named as "sellers" (Item 14). As previously stated, the "Closing Instructions and Agreement to pay Commission" portion of the Earnest Money agreement appears only on the owner's copy and the broker's original.

Completed contract copy of the Earnest Money form can now be delivered to seller.

(16) It is requisite that under Board rulings the broker deliver back to the purchaser a completed copy of the agreement showing seller's acceptance. This delivery can be made either manually and acknowledged by the purchaser or can be delivered by registered mail with return receipt attached.

The remaining original should be filed in the broker's Closing Statement Deal Envelope or Deal Folder for safekeeping and subsequent reference pending the closing of the transaction and the compiling and submitting of Broker's Closing Statement to the buyer and seller.

EXCHANGE CONTRACTS

Provide for dual commission and are sometimes quite difficult to handle on one or more earnest money receipt forms. Special forms of "Exchange Contracts" are available and are recommended for use in exchange transactions.

Earnest Money Receipt and Agreement to Purchase Problem

1 On February 1, 1968 Robert Buyer and Sally
2 Buyer, husband and wife, offer to purchase the property belonging to John Seller and Mary Seller as listed on January 6, 1968.

Portland, Oregon

EARNEST MONEY RECEIPT

City Salem State Oregon February 1, 1968

RECEIVED FROM Robert Buyer and Sally Buyer, husband and wife (hereinafter called "purchaser")

the sum of One Thousand and no/100 ..... Dollars ($ 1,000.00)

in the form of Check (CASH, CHECK, DRAFT) as earnest money and in part payment for the purchase of the following described real estate situated in the City of Salem, County of Marion, State of Oregon to-wit:

Lot 6, Block 10, Yew Park Addition, also known as 280 Yew Park Drive

which we have this day sold to said purchaser

for the sum of Fifteen Thousand and no/100 ..... Dollars ($15,000.00)

on the following terms, to-wit: The sum, hereinabove receipted for, of One Thousand and no/100 Dollars ($ 1,000.00);

* {On ..... 19 ....., as additional earnest money, the sum of Three Thousand Eight Hundred Dollars ($ 3,800.00);
{On owners acceptance,

Upon acceptance of title and delivery of * {deed, [redacted] the sum of ..... Dollars ($ .....);

Balance of Ten Thousand Two Hundred and no/100 ..... Dollars ($10,200.00)

payable as follows: Assume and agree to pay balance of existing mortgage adjusted to date of closing, balance in cash. Balance on mortgage as of January 1, 1968, $10,200.00 payable $85 per month including interest at 6% per annum. Seller to pay paving assessment balance of $284.00 plus accumulated interest at 6% paid to March 1, 1967. (See exhibit A attached and by reference made a part hereof.)

A title insurance policy from a reliable company insuring marketable title in seller is to be furnished purchaser in due course at seller's expense; preliminary to closing, seller may furnish a title insurance company's title report showing its willingness to issue title insurance, which shall be conclusive evidence as to seller's title; [redacted]

It is agreed that if seller does not approve this sale within the period allowed broker below in which to secure seller's acceptance, or if the title to the said premises is not insurable or marketable, or cannot be made so within thirty days after notice containing a written statement of defects is delivered to seller, the said earnest money shall be refunded. But if said sale is approved by seller and title to the said premises is insurable or marketable and purchaser neglects or refuses to comply with any of said conditions within ten days after the said evidence of title is furnished and to make payments promptly, as hereinabove set forth, then the earnest money herein receipted for shall be forfeited to seller as liquidated damages and this contract thereupon shall be of no further binding effect.

The property is to be conveyed by good and sufficient deed free and clear of all liens and encumbrances except zoning ordinances, building and use restrictions, reservations in Federal patents, easements of record and, Existing mortgage of record as described above.

All irrigation, plumbing and heating fixtures and equipment (including stoker and oil tanks but excluding fire place fixtures and equipment), water heaters, electric light fixtures, light bulbs and fluorescent lamps, bathroom fixtures, venetian blinds, drapery and curtain rods, window and door screens, storm doors and windows, attached linoleum, attached television antenna, all shrubs and trees and all fixtures except 3 patented rose bushes.

are to be left upon the premises as part of the property purchased. The following personal property is also included as a part of the property for said purchase price: 1 G.E. automatic washer

Seller and purchaser agree to pro rate the taxes which are due and payable for the current tax year. Rents, interest, premiums for existing insurance and other matters shall be pro rated on a calendar year basis. Adjustments are to be made as of the date of the consummation of said sale or delivery of possession, whichever first occurs. Encumbrances to be discharged by seller may be paid at his option out of purchase money at date of closing.

Possession of said premises is to be delivered to purchaser on or before March 1, 19 68, or as soon thereafter as existing laws and regulations will permit removal of tenants, if any. Time is the essence of this contract. The purchaser's rights herein are not assignable without written consent of seller.

Mary Seller

Robert Buyer
Sally Buyer

(**Note:** The Earnest Money Receipt is a complete contract. Frequently the blank spaces are insufficient and all of the pertinent data is not included. The buyer is entitled to know what costs he will be obliged to pay at closing. Information that can not be placed in the blanks of the Earnest Money Receipt should be made a part of the contract by either the use of the back of the form or an attachment. Stevens-Ness offers a blank form for this purpose, or a sheet of paper marked and identified as a part of the contract can be attached.)

Closing Statement

The terms of the listing agreement make no provision obligating a broker to close a real estate transaction. A broker has completed his employment and earned his commission when he finds a buyer whose offer meets the terms of the listing, or any other terms acceptable to the seller. (See excerpt 5.)

If a broker does not assume the responsibility for closing a transaction, he has only the following duties to perform:

(a) If a transaction is being closed by a title insurance company, escrow agent or attorney, he must immediately pay all earnest money which he has received in the transaction to that third party to disburse, or deposit the earnest money in his trust account as required by Rule 10-025 of the Real Estate Board and hold this earnest money in readiness to be disbursed upon the closing of the transaction.

(b) He must see to it that both the buyer and the seller receive complete closing statements and that he has a true copy thereof in his own files. (See 10-030.)

If a broker takes the responsibility of closing a transaction he owes the following responsibilities to the parties:

(a) The transaction must not be closed by a salesman except under authority and supervision of the broker. He is responsible for all of the acts of the salesman or of an employee if he delegates this job.

(b) He must deposit all monies received in the transaction, immediately upon their receipt, in a separate bank account maintained by him for that purpose. This money must be retained in this bank account until the transaction is closed. In depositing the money he must indicate on his deposit slip the names of all parties involved in the transaction. He must keep a complete record in his office showing all amounts received and disbursed in the transaction. This record must be kept available for the inspection of the Real Estate Commissioner's office.

(c) He must give to both the buyer and the seller a complete, detailed closing statement showing all receipts and disbursements handled by him and must retain a copy thereof in his files.

(d) If the broker assumes the responsibility of computing the various adjustments in the transaction, he must be sure that he has obtained all of the pertinent facts in relation thereto and that his computations are correct. He is, in this situation, personally liable for all errors in his computation and for any negligence in his failure to determine the facts with relation to the adjustments.

The growing popularity of escrow closing, with the parties dividing the escrow fee, will eliminate many misunderstandings and complaints common to many small offices doing their own closing.

On the other hand, every broker should be familiar with closing techniques in order to be able to clearly explain the charges and credits shown in a closing statement.

No broker should assume to pass upon the validity or necessity of the legal documents used in closing a transaction.

LITTLE THINGS THAT CAUSE TROUBLE

Most loans have prepayment penalties, and these vary widely on conventional loans. Some lenders charge additional interest on FHA loans in addition to the allowable prepayment penalty.

Many assumable loans have assumption fees, which vary considerably.

Some conventional loans have acceleration clauses, which can cause the interest on an assumed loan to rise. Sometimes a loan brokerage fee is asked on an assumed loan. Drawing and recording of documents add to closing costs. A brokerage fee on a new loan could be an added cost.

Buyers are sometimes shocked to learn that the estimated closing costs did not include the assumption of the reserve account.

On the plus side, an alert broker, transferring title to a property having secondary financing, earns respect if he explores the possibility of a discount for cash.

KEEP IT SIMPLE

The closing statement has always been a real problem in the real estate industry.

There are two very acceptable types of closing statements. One is set up on a "debit" and "credit" basis. In bookkeeping or accounting this is known as a "T" account; it is so called because debits are entered on the left side of "T" and credits on the right side with the total of each column being equal.

This type of closing statement is extremely professional and is very fine IF the broker is knowledgeable of accounting methods and so are both the seller and buyer; or if either buyer or seller is not, the broker is willing and able to take the time at a closing to explain the statement in a manner that the person completely understands.

However, it is not sufficient to merely state that a certain item is a "debit" or "credit", with an attitude or tone of voice that suggests a person of course knows what a credit or debit is. And if not, he is obviously stupid. Another hazard of this type of closing statement is that the same particular item may be EITHER a "debit" or a "credit", depending on to whose account it is posted.

The second type of statement is that commonly referred to as "single entry". This type of statement does not have the professional accounting appearance of the double entry type statement. However, it is easily understood by all parties to a transaction even if they have no knowledge of accounting terminology.

It is recommended that you use whichever type of closing statement you find most comfortable and convenient for yourself and your clients, but if in doubt, use the second type. Most of the standard closing forms combine a little of each type.

STANDARDIZED CLOSING STATEMENTS

Lack of uniformity in the preparation of closing statements always has been a thorn in the side of real estate practitioners.

The closing statement in a real estate transaction deals primarily with figures, and all these figures affect the accounts of both the buyer and the seller. These statements can have a direct bearing on the individual's financial statement or income tax.

Nothing destroys confidence faster than for the buyer at the time of the closing to find out that he owes additional money. To prevent such a situation the broker should know or make a reasonable estimate as to taxes, insurance, tenant's rent and water bills long before the closing date.

There are so many things to remember while collecting the necessary items for the closing statement that some successful offices use a check list. The more printed forms, reminders and tables you acquire and use the easier and more accurate is the closing.

Here is where you make future sales—follow through—make certain there has been an examination of title, that there has been a transfer of insurance policies, that prorating of taxes and other charges are correct, that all documents (deed, mortgage, chattel mortgage and leases) have been recorded, that utilities services have been transferred and leases assigned.

The apportionment of income and expense items will be more readily followed if computed according to some uniform pattern. In the absence of an official custom in Oregon it is suggested that the following rules be followed:

1. All adjustments of interest, rents, taxes, water rates and insurance premiums shall be made to the day on which title is closed.
2. Interest, rents, taxes, water rates and insurance shall be computed by the 360-day method, each month representing 1/12th of the annual charge and each day 1/30th of the monthly charge.
3. Where the period for which the computation of interest, rents, taxes, water rates and insurance is to be made is more than one month, the elapsed time shall be computed by full months and by the actual number of days in excess of such full months.
4. Where the period for which the computation of interest, rents, taxes, water rates and insurance is to be made is less than one month, the actual number of days shall be counted, excluding the first day and including the last.

NOTE: These rules mean that the seller shall be charged with interest, taxes, water rates and insurance to and including the day immediately preceding the day on which title is closed and that the purchaser shall bear these items from the day on which title is closed and receive the rents from that day.

HOW TO PRORATE

The above rules are desirable because they create uniformity and thus reduce the always present danger of misunderstandings.

It must be remembered, however, that the rules can always be altered or resolved by agreement between the parties. The most important rule is that there be agreement and full understanding on the part of each party to a transaction.

In arriving at what period of time taxes, insurance and interest are to be charged, the simplest and most accurate method is the year, month and day subtraction.

If a transaction closed March 1, 1968, and the seller paid the 1967-68 taxes in advance we will

find the period of time for which the buyer must be charged as follows:

68– 7–1 taxes paid to

68– 3–1 prorated to

4 months taxes to be paid by buyer

The improvements on the property are covered under a three-year fire insurance policy issued December 1, 1967. The seller had paid the three-year premium in advance. Our proration is as follows:

70–12–1 premium paid to

68– 3–1 prorated to

2– 9–0 buyer owes for 2 years, 9 months of unearned insurance premium

A balance is still due on a paving lien, plus interest at 6% from March 1, 1967, both of which the seller will pay. We compute as follows:

68– 3–1 interest due to

67– 3–1 interest paid to

1 buyer must pay interest for one year.

Proration rules and the mechanics of computation are found in the mathematics section of the Manual.

STUDY OF THE CLOSING STATEMENT

The information required for the final closing is shown in the listing agreement and Earnest Money Receipt problem and illustration. Check each item through to the final distribution of funds as shown on the closing statement.

The members of the Real Estate Board place considerable weight in the points allowed for preparing the closing statement in the brokers' examination. For those who are preparing for this examination we suggest that after you have thoroughly studied this problem that you prepare similar problems, using standard forms. Also our files reveal that some brokers already licensed could spend some time which would prove very valuable to them if they would carefully review this section.

STEVENS-NESS FORM NO. 669

The use of this form will not be so complicated if you will keep 4 things in mind.

1. The purchaser's debits are those items which the purchaser must pay, including the price of the property.
2. The purchaser's credits are those items which the buyer will pay in the future, the rent which may have been collected in advance by the seller and the money which has been paid by the buyer as earnest money, an additional payment if any and the cash paid on closing.
3. The seller's credit is an itemized list of the moneys shown in the purchaser's credits. This is the cash which the broker has in his Clients' Trust Account.
4. Charges against seller is an itemized list of the obligations of the seller which are being paid by the broker. After these have been paid by the broker from the funds of this sale in the Client's Trust Account, the balance will be paid to the seller.

Every broker and salesman should be able to prorate taxes, fire insurance premiums and rents and compute interests on mortgages, taxes and city liens. Keep in mind the recording fees to be paid by the purchaser and seller.

IMPORTANT NOTICE

Frequently in the real estate examination, the printed Closing Statement form is not used. The applicant is supplied with plain white sheets of paper on which to prepare the closing statement for the seller and the closing statement for the buyer. Examples are found in this section.

Closing Statement Problem

As of March 1, 1968 we are ready to prepare the Closing Statement in accordance with the terms as shown on the Earnest Money Receipt.

1 **Seller:** John Seller and Mary Seller, husband and wife.

2 **Buyer:** Robert Buyer and Sally Buyer, husband and wife.

3 **Description of Property:** Lot 6, Block 10, Yew Park Addition to Salem, Marion County, Oregon.

4 **Purchase Price:** $15,000.00.

5 **Date of Closing:** March 1, 1968.

6 **Earnest Money Receipt:** $1,000.00. Check Commercial Bank, Salem, Oregon.

7 **Mortgage Assumed:** Buyer is to assume balance of mortgage of $10,131.83 as of March 1, 1968. (The principal amount of $10,200.00 owing on January 1, 1968 has been reduced by payments made by the seller.)

8 **Taxes:** The 1967-68 taxes assessed on the property are $192.00, paid in advance by the seller.

9 **Insurance:** The improvements are insured by fire insurance in the amount of $12,000.00 written for a three year period effective December 1, 1967, and the three year premium paid in advance was $72.00.

10 **Utilities:** The estimated water bill to date of closing is $4.50. To be assumed.

11 **Title Insurance:** To be paid by seller, $91.25.

12 **Assessments:** A balance of $284.00 plus interest is still due on a paving lien. Interest paid to March 1, 1967.

13 **Recording Fee:** A deed recording fee of $1.50 is to be paid by purchaser.

Purchaser's Copy

Deal No. 1301 March 1, 1968 Salem, Oregon

Property of John Seller and Mary Seller, husband and wife, sold to Robert Buyer and Sally Buyer, husband and wife, by A. Broker, a real estate broker.

Description: Lot 6, Block 10, Yew Park Addition to the City of Salem, Marion County, Oregon.

Selling price and terms: $15,000.00. Purchaser assumes and agrees to pay mortgage balance of $10,131.83 and pays equity in cash. Taxes and insurance premium prorated to this date. Purchaser given credit for assuming unpaid water bill. Paving assessment and accumulated interest paid by seller.

Paid or Assumed by Purchaser		Purchaser's Credits	
Purchase price	$15,000.00	Earnest money paid 2/1/68	$ 1,000.00
Prorate 1967-68 tax	64.00	Mortgage balance assumed	10,131.83
Prorate insurance premium	66.00	Unpaid water bill assumed	4.50
Recording of deed	1.50		
TOTAL OBLIGATIONS	$15,131.50	TOTAL CREDITS	$11,136.33

CASH PAID ON CLOSING $3,995.17

The foregoing statement is hereby certified to be correct.

A. Broker *Broker*

Receipt of foregoing Purchaser's Statement acknowledged March 1, 1968.

Robert Buyer *Purchaser*

Sally Buyer *Purchaser*

Closing Statement
Seller's Copy

Deal No. 1301 March 1, 1968 Salem, Oregon

Property of John Seller and Mary Seller, husband and wife, sold to Robert Buyer and Sally Buyer, husband and wife, by A. Broker, a real estate broker.

Description: Lot 6, Block 10, Yew Park Addition to the City of Salem, Marion County, Oregon.

Selling price and terms: $15,000.00. Purchaser assumes and agrees to pay mortgage balance of $10,131.83 and pays equity in cash. Taxes and insurance premium prorated to this date. Purchaser given credit for assuming unpaid water bill. Paving assessment and accumulated interest paid by seller.

Purchase price	$15,000.00		
Prorate 1967-68 tax	64.00		
Prorate insurance premium	66.00		
Recording of deed	1.50		
Total obligation of purchaser		$15,131.50	
Earnest money paid 2/1/68	1,000.00		
Mortgage balance assumed	10,131.83		
Unpaid water bill assumed	4.50		
Total credits to purchaser		11,136.33	
CASH PAID ON CLOSING			$3,995.17
Charges against seller:			
Title insurance policy	91.25		
Broker's commission	900.00		
Recording fee paid by purchaser	1.50		
City lien and interest	301.04		
Total charges against seller		1,293.79	
BALANCE DUE SELLER			3,701.38
Total Cash Received	$4,995.17		
Total Disbursed	$4,995.17		

The foregoing statement is hereby certified to be correct.

A. Broker *Broker*

March 1, 1968

Receipt of $3,701.38 is hereby acknowledged in full settlement of the proceeds of the above sale, also a true copy of the foregoing statement.

John Seller *Seller*

Mary Seller *Seller*

REAL ESTATE MATHEMATICS

INTRODUCTION

The Real Estate profession is faced with the problems inherent in any profession which is trying to upgrade the quality of its service to the public. The results of examinations given to real estate licensee applicants has proved that the area of arithmetic is in definite need of improvement. Far too many applicants fail the examination for broker as well as salesman because of an inability to be facile in the handling of numbers. The use of numbers in the communication process is growing more rapidly than the use of words. The automated processes of the age rely on precise skill in the use of numbers. The average citizen is faced with increasing number problems when he uses his telephone, mails a letter, applies for a position, or uses his credit card.

This section of the Manual is not intended to be a complete review of all the problem areas that will confront the salesman, but it is a hope that proper study of the text material and a working of the problems will help review the applicant on the basic computational areas. There is a short bibliography of currently published Business Mathematics and Business Arithmetic texts at the end of the section, should you desire or need to review in depth some of the arithmetic subjects that are indistinct in your memory.

Computation of Areas

AREAS OF FLAT SURFACES

When you wish to find the area, or amount of surface, you use square units of measure. In order to understand these units and their relationship to each other, you will need to review certain facts about the rectangle and the square. A *rectangle* is a four-sided figure whose opposite sides are equal and whose angles are right angles. A *square* is a rectangle all of whose side are equal.

Rectangle

Square

The area of a rectangle is found by multiplying its length by its width when the two dimensions are expressed in terms of the same linear unit. The short way of writing a rule is called a formula. The formula for the area of a rectangle is:

$$A = l \times w \qquad \text{or} \qquad A = lw$$

where A is the area, l the length, and w the width.

Since the square is a particular kind of a rectangle, we find its area in the same way as the area of a rectangle.

From the diagrams below you can see that the area of a triangle, or three-sided figure, is half the area of the rectangle. The height of a triangle is called its *altitude;* the side upon which the triangle seems to rest is called its *base*. The *area of a triangle is equal to half the product of its base and its altitude* when these two dimensions are expressed in terms of the same linear unit. The formula for the area of a triangle may be written as:

$$A = \tfrac{1}{2} \times b \times h \qquad \text{or} \qquad A = \tfrac{1}{2}bh$$

UNITS OF AREA

The units of area are all squares. The square inch is a square one inch on each side. A square foot is a square one foot on each side. You will be able to visualize a square foot if you lay four rulers, each one foot iong, so that they form a four-sided figure whose corners are right angles. The square yard is a square which is one yard on each side. Other units of square measure are the square rod, the acre, and the square mile.

Table of Square Measure

12 × 12 or 144 sq. in.	= 1 sq. ft.
3 × 3 or 9 sq. ft.	= 1 sq. yd.
5½ × 5½ or 30¼ sq. yd.	= 1 sq. rd.
160 sq. rd.	= 1 acre (A)
640 A	= 1 sq. mile

MEASUREMENT OF A CIRCLE

To find the circumference (distance around) of a circle, multiply the diameter (distance across) by 3.1416 (Pi).

To find the diameter divide the circumference by 3.1416.

To find the area of a circle, multiply the circumference by ½ the radius (distance from center to circumference); or multiply diameter × diameter × .7854 (¼ Pi); or multiply radius × radius × 3.1416. The result will be in square units.

MEASUREMENT OF A CYLINDER OR BUCKET

To find the volume of a cylinder first find the area of one base (a circle) and multiply it by the length.

To find the volume of a bucket, with different size ends, find the area of each end (both circles) and add them together, then divide this sum by 2 and multiply by the height of the bucket.

A "trapezium" has 4 sides, of which no sides are parallel. To find the area draw a dividing line forming two triangles. Multiply the length of the base × ½ the height of each, and add the two for the total area.

called the straight-line depreciation rate. This system is the easiest to understand because once the rate is established the calculation is the same each year regardless of the actual wear and tear on the property.

The present tax laws recognize the straight-line method as well as the declining balance method and the sum of the years-digits method. Discussion of each of the alternative methods will not be presented here but the methods should be studied *thoroughly* before advice is given to an income property owner regarding the particular method he should use in his tax preparation.

STRAIGHT-LINE METHOD

The average annual depreciation is often expressed as a per cent of the original cost under the straight-line method of spreading the total depreciation. The average annual depreciation therefore represents part; and the original cost represents the base, or whole, with which the part is compared. The formula would be as follows:

$$\text{Rate of Depreciation} = \frac{\text{Average Annual Depreciation}}{\text{Original Cost}}$$

Another way of saying the same thing, is to take the total original cost of a building and divide that number by the number of years that the property will have a useful life. The result will be the amount of the annual depreciation. Thus,

$$\text{Annual Depreciation} = \frac{\text{Original Cost}}{\text{Length of Life of the Property}}$$

In the calculation of depreciation, the cost of the land is always *excluded*. Land does not depreciate and hence should not be involved in the cost computation.

The calculation of depreciation becomes more involved when an older building or a home is being sold. Assuming that the annual rate of depreciation has been determined it is then possible to estimate the present value of the structure after knowing how many years the building has been standing. For example, if a ten year old building has been depreciating at the rate of 2% per year, what then is the present value quoted in terms of a percentage of its original value? Since the building has been depreciating 2% per year for 10 years, then 20% of its value must have been used leaving 80% still to be depreciated.

PROBLEMS:

1. The value of a house at the end of four years was estimated to be $8,725. What was the original cost of the dwelling if the annual rate of depreciation was 4¼%?

Steps: a. If the house depreciated 4¼% each year and it is four years old, then it must have depreciated 17% over the period. (4¼% × 4 years)

b. If the value has been reduced by 17% from original value, which is always stated in terms of 100%, then the current undepreciated value of the house would be 83%.

c. If the house is worth $8,725 after four years of use, then this figure is equal to 83% of the original cost.

d. To find original value of the house, divide $8,725 by 83%, or $8,725 divided by .83 and the result of the division would reveal that the original estimated value was $10,512.04.

2. The value of a house at the end of six years was estimated to be $7,650. What was the original cost of the dwelling if the annual rate of depreciation was 2½%?
3. In purchasing an eight year old house, an appraiser estimated present value at $23,400. If the rate of depreciation is 2¾% a year (straight-line) from the original value, what was the original value?

PRORATION RULES

Prorating means adjusting taxes, insurance, rents and interest to determine two things:

1. Whom to charge and for what period of time.
2. Amount of money to charge.

In determining whom to charge and for what period of time you need only the closing date and the date to which the item has been paid.

Remember, if the item is paid beyond the closing date there is a charge against the buyer. If the item was paid short of the closing date there is a charge against the seller.

To determine the time period for the charge use the "year, month and day" method of subtraction.

Taxes

Closing date, December 1, 1967.

1967-68 taxes paid to July 1, 1968.

Year	Month	Day
68	7	1
67	12	1
—	—	—
0	7	0

In this example the buyer is charged for taxes for 7 months.

You will notice that under the month column we were unable to subtract 12 from 7 so we borrowed a year, 12 months, from the year 1968 and subtracted 12 from 19.

Closing date December 15, 1967

Taxes paid to July 1, 1968

Year	Month	Day
68	7	1
67	12	15
—	—	—
0	6	16

Because we can not subtract 15 from 1 under the day column we borrowed one month, 30 days, from the 7 in the month column, and then borrowed a year, 12 months, from the year column. This made our problem look like this:

Year	Month	Day
67	18	31
67	12	15
—	—	—
0	6	16

Buyer is charged with 6 months and 16 days.

8156

Insurance

Policy period from June 1, 1966, to June 1, 1969.
Closing date: February 1, 1968.

Year	Month	Day
69	6	1
68	2	1
1	4	0

Buyer's share = 1 year and 4 months.
Policy period from June 1, 1966, to June 1, 1969.
Closing date: March 12, 1968.

Year	Month	Day
69	6	1
68	3	12
1	2	19

Rents

Apartment unit paid from July 10, 1968, to August 10, 1968.
Closing date: July 19, 1968.

Year	Month	Day
68	8	10
68	7	19
0	0	21

Buyer receives credit for 21 days.

Interest

Last payment on a mortgage was October 1, 1968.
Next payment is due November 1, 1968.
Closing date: October 20, 1968.

Year	Month	Day
68	10	20
68	10	1
0	0	19

19 days charged to seller.

Note: Since interest paid on October 1, 1968, is really the interest charge for the month of September, 1968, the November 1, 1968 payment will pay the interest for all of October, 1968.

The *buyer* will make the payment for the October, 1968 interest on November 1, 1968. Since the buyer will have to pay this, the buyer is entitled to a credit for 19 days, which is the seller's share of the October interest.

These rules mean:

The buyer is charged for day of closing for interest, taxes, and insurance.

The buyer receives the rent for the day of closing.

DETERMINING AMOUNT OF MONEY TO CHARGE

1. *Taxes and Interest:* Divide annual amount by 12 to find monthly amount.
   Divide monthly rate by 30 to find daily amount.
2. *Insurance:* If 3 year policy, divide by 36 to find monthly amount. Divide monthly rate by 30 to find daily amount.
3. *Rents:* Divide monthly rent by 30 regardless of number of days in month.

In your division problem carry the result to three places to the right of the decimal.
The solution to your proration problem is arrived at by multiplying the period of time you found by subtraction by the amount of money found by division.

PROBLEMS:

1. The property tax on a parcel of real estate is $180 per year. The taxes are due and payable on or before November 15 of the fiscal year. The buyer is to pay the taxes when due. How much would you charge the seller and credit the buyer if the taxes were prorated as of October 1st?

Year	Month	Day	
?	10	1	Closing date
?	7	1	Lien date
	3 months		

$180.00 ÷ 12 = $15.00 per month

3 months × $15.00 = $45.00

2. The buyer has agreed to purchase a piece of property on which the current taxes are still unpaid, amounting to $375.00 and the insurance premium for a three year period amounted to $90.00, which has been paid by the seller. The closing date is September 1, 1968. The insurance policy is from 9/1/66 to 9/1/69. How would you prorate the allowable expenses for each party?

INTEREST ON TAXES:

You must remember to account for interest on real property taxes not paid on the quarterly due dates.

Confusion exists in this area only because a person fails to keep in mind that interest is charged from the *DUE DATE* of each quarter *UNTIL PAID*, rather than from the beginning of the tax year or some other date.

Tax due dates are November 15, February 15, May 15, and August 15.

Remember that interest is due on each quarter after the passing of the quarterly due date. The buyer is given no credit for a discount taken by a seller for prepayment of taxes.

To determine an interest credit: 1. find the difference between the due date of the tax quarter in question and the closing date. (Use year, month and day method); 2. multiply the interest rate of 2/3 of 1% times tax for quarter; multiply interest per month times number of months delinquent to find taxes for that quarter.

EXAMPLE:

Taxes for 1967-68 tax year were $480. The closing date was May 1, 1968; none of the taxes are paid.

What is the interest for the first quarter?

Year	Month	Day	
68	5	1	taxes paid
67	11	15	1st quarter due
—	—	—	
	5	16	

(The interest rate on taxes is 2/3 of 1% per month or FRACTION thereof; therefore 1 day equals one month in interest)

In the above example the first quarter is delinquent 6 months.

¼ of $480 = tax due per quarter.
.00667 (2/3 of 1%) × $120 = .80040 or 80 cents interest per month.
.80 × 6 months = $4.80 interest 1st quarter.

Investments in Real Estate

GROSS INCOME VS. NET INCOME CONCEPTS

The broker or salesman is often approached by persons interested in learning about the value of an investment in real estate. Great care and caution must be given to questions of this type since the profession of real estate selling is being held to a high degree of accountability for the advice given.

The rent that a property owner receives from a tenant represents his *gross* income from the property. The *net* income is the amount remaining after deducting the ownership expenses from the gross income. The income and expenses are usually figured on an annual basis. The expenses should include all properly chargeable items such as taxes, insurance, repairs and upkeep, and interest on the mortgage if there is a mortgage on the property. These expenses are called cash expenses since they represent the amount of money that has been spent. The other type of expense for which there must be an allowance in the calculation of net income is depreciation. The decrease in the value of the property must be recognized as an expense just the same as an expense for which cash may have been spent.

DETERMINATION OF NET INCOME AND RATE OF INCOME

The annual net income on an investment in real estate is the amount remaining ofter deducting total annual expense from the annual total or gross income received from rent. The relationship can be expressed by formula as:

$$\begin{array}{l}\text{Annual Rental Income}\\ \text{minus Annual Expenses}\end{array} = \text{Annual Net Income}$$

To determine the rate of income from a real estate investment it is necessary to find out the amount of the owner's cash investment in the property and dividing the annual net income by the cash investment. Expressed by formula as:

$$\text{Rate of Income} = \frac{\text{Annual Net Income}}{\text{Cash Investment}}$$

FACTORS AFFECTING YIELD AND TOTAL INVESTMENT

The property owner may desire information as to the amount of rent to be charged to yield a certain rate of return on the investment. If the owner desires a stated rate of return on his investment, then the annual rental income must be sufficient to cover all annual expenses plus the amount of the net income desired. It might be stated in this manner:

$$\text{Annual Rental Income} = \begin{array}{c}\text{Annual Expenses}\\ \text{plus Annual Net Income}\end{array}$$

The monthly rent that should be charged can then be found by dividing the required annual rental income by 12.

When the problem arises of learning what total investment is necessary to provide an annual net income of a certain figure and the rate of income is known, the amount of the cash investment in the property can be found by dividing the annual net income by the rate of return. Thus:

$$\text{Cash Investment} = \frac{\text{Annual Net Income}}{\text{Rate of Return}}$$

PROBLEMS:

1. M. E. Cowan bought a two-family house for $11,000, paying $4,500 in cash and giving a 4½% mortgage for the remainder. The lot was valued at $1,500 and the building at $9,500. During the first year, he received $57.50 a month for rent of each apartment. In addition to the interest on the mortgage, he paid $239.50 for taxes, $27.00 for insurance, $175.00 for repairs and miscellaneous expenses, and allowed 2% of the value of the house for depreciation. What was the amount of the net income for the year?
2. L. M. Sisson purchased a house and lot as an investment for $6,000, paying $2,000 in cash and giving a 6% mortgage for the balance. The house rents for $55 a month. Besides interest on the mortgage, other annual expenses including depreciation amount to $320. What is Mr. Sisson's annual net income from the investment? Mr. Sisson's annual net income is what per cent of his *cash* investment?
3. A four-family house is purchased for $22,000, subject to a $15,000 mortgage at 5%. The annual expenses, in addition to interest on the mortgage, include $735 for taxes, $55 for insurance, $325 for repairs, and $600 for depreciation. What monthly rental to the nearest dollar must be charged each family in order that a net income of 6% may be realized on the investment.
4. Mr. Smith's annual net income from an apartment house is $1,995, which is 5% of his investment in the property. What is the amount of his investment?
5. An apartment house had a gross income of $1,250 per month with annual expenses of $5,900, including depreciation. What price would a buyer pay for the property to show a net return of 6¾% per annum on his investment computing the answer to the nearest cent?

FIGURING THE RATE OF CAPITALIZATION

This is repetition of the preceding explanation but many think of investments in real estate on the basis of "capitalization rates."

When thinking of capitalization rates, consider the equation: income divided by rate equals the value.

-188158

Thus: I ÷ R = V. Because this is an algebraic equation if any 2 parts are known the third can be determined:

as above I ÷ R = V; or I ÷ V = R; or V × R = I

From the formula, it is evident that "capitalization" is the process of ascertaining the magnitude or worth or value of a capital good through the use of a rate. The rate is believed to represent the proper relationship between the capital good or property, and the net income it produces.

Q. A man has a sum of money on deposit in a savings bank which pays 2% interest on the deposit. The amount of his deposit in the bank is sufficient to give him an annual income of $1,000. How much money does he have in the bank?

A. Step 1. There are 3 different things to consider: the income, the interest rate, and the deposit. The first 2 are known: $1,000 and 2%. The third is unknown.

Step 2. As the rate expresses the income and the deposit, we can say that $1,000 is 2% of the deposit, or $1,000 ÷ .02 (I ÷ R) = $50,000 (V).

Q. A man owns an apartment building. His net income (after depreciation) from the property is $12,000. The rate of return expected by investors from this type of property in the area is 6%. What is the amount of capital in the property?

A. Step 1. Two things are known: the amount of the income, $12,000, and the rate which expresses the fixed relationship between the income and the value, 6%.

Step 2. If $12,000 is 6% of the figure which represents the value of the property, it is evident that the property is worth: $12,000 (I) ÷ .06 (R) = $200,000 (V). Thus the man has $200,000 capital in the property.

Calculation of Interest

INTEREST DEFINED

Real estate transactions usually involve the calculation of interest. Briefly defined *interest is the rent of money*. The landlord charges rent for the use of his property by the renter. Likewise, a lender makes a charge for the use of his funds by the borrower. In the latter case the money is rented. The interest charge is computed on the basis of an interest rate. Like most other rates, it is expressed as a per cent of value, such as 6%. This rate, unless otherwise stated, is considered to be the annual rate and referred to as per annum or for the year, and is that rate on each unit of $100 that is borrowed. Thus, the term "with interest at 6%" means that, if the borrower should hold the money for an entire year, the interest charge would be $6 for each $100 borrowed.

FINDING EXACT INTEREST

Although the 360-day year is used in most commercial transactions that involve interest, the United States Government, in interest computations, always uses 365 as the number of days in a year. The 365-day year, therefore is called a government year. The 365-day year is also referred to as an exact year, since it contains the actual number of days in the year. When interest is found by this method, it is called exact or accurate interest. For example, Mr. Gibbons borrowed $640 at 6% for 85 days. To find the exact interest on this principal you would substitute those facts known into the general interest formula: I = PRT

$$I = \$640 \times 6\% \times 85 \text{ days}$$
$$I = \$640 \times {}^{6}/_{100} \times {}^{85}/_{365}$$
$$I = \$8.94$$

This method is not used commonly in business transactions however, it is well to know how to perform the calculation as you may have a business deal with a unit of government.

When trying to figure the interest rate on a given amount of money due, consider the formula: Principal × Rate × Time = Interest (PRT = I).

Q. The amount of a note is $1,000 and the annual rate of interest on the note is 3%. How much interest will be paid on the note in one year?

A. Applying the formula, Principal ($1,000) × Rate (3%) × Time (1 yr.) = Interest ($30.00).

Q. If the interest rate is 4½% and the monthly interest payment is $21.25, what is the principal sum due?

A. *Step 1.* If the monthly interest payment is $21.25, then 12 times that amount would give the amount of interest paid in 1 year. Thus 12 × $21.25 = $255.

Step 2. Our formula now appears as: Principal (?) × Rate (4½%) × Time (1 yr.) = Interest ($255).

Step 3. To solve for the principal, state the formula as P = I ÷ RT. The interest ($255) divided by the rate (.045) times the time (1 yr.) gives us the answer of $5,666.66 for the principal.

COMPUTATION OF INTEREST USING 6%, 60 DAY METHOD

For years the business world has been using the 360-day year in the calculation of interest. This method was developed long before the day of the computer and the automatic calculators and is still used because of the speed with which the answer can be obtained in comparison with the exact method. The 360-day year is called by different names, the most commonly used being bank or banker's year, commercial year, business year, or ordinary year.

For example, $720 was borrowed at 6% for 90 days and you are asked to compute the interest to be charged on this loan. Using the formula, I = Prt, you can easily determine that $720 multiplied by 6% would yield the interest for one year. This would amount to $43.20. The problem stated that the money was borrowed for only 90 days. Since 90/360 of a year is ¼ of a year, the interest charged the borrower will be ¼ of $43.20 or $10.80.

The use of the 6%, 60 day method, will shorten the calculation process still further. The base or formula will always begin with 6% for the rate and 60 days for the time. In that case the last two fractions in the formula ${}^{6}/_{100}$ and ${}^{60}/_{360}$ and the product of these two fractions will always be ${}^{1}/_{100}$. Therefore, no matter what the principal is, it must be multiplied by ${}^{1}/_{100}$. This is another way of saying that the principal must be divided by 100. The quickest way to accom-

plish this is to move the decimal point in the principal two places to the left. For example, What is the interest on a $575 loan at 6% for 60 days.

$I = Prt \quad I = \$575 \times 6\% \times 60$ days

$I = \$575 \times {}^{6}/_{100} \times {}^{60}/_{360} = \$575 \times {}^{1}/_{100} = {}^{\$575}/_{100}$

$I = \$5.75$

The rule is therefore, *that the interest on a loan that was made for a period of 60 days at an interest rate of 6% can be found by moving the decimal point two places to the left of its original position in the principal.*

PROBLEMS:

1. Assume in the following problems that the interest rate was 6% and the time was for 60 days. (You will note the answers in the parentheses)

a. $325	(3.25)	c. $854.30	(8.54)
b. $476	(4.76)	d. $3,425.50	(34.26)

If the time in the preceding problems had been 120 days rather than for 60 days, the interest would be found by doubling the interest for a 60 day period of time. Conversely, if the time had been for only 30 days, the interest would have been exactly one-half of the cost for the 60 day period of time. As can be seen from the above, that the number of days whether more or less than the number of days in the formula, can be used in ascertaining the interest for the number of days in the problem.

2. What is the interest on $840 at 6% for 96 days?

   Steps: a. $8.40 = 60 days' interest at 6% on $840
   b. $4.20 = 30 days' interest (½ of 60 days)
   c. .84 = 6 days' interest (1/10 of 60 days or move decimal point one place)

3. Assume the interest is at 6% on each of the following loans.

a. $900 for 80 days	($12.00)
b. $800 for 90 days	($12.00)
c. $400 for 33 days	($2.20)
d. $375 for 49 days	($3.06)

4. The banker's 60-day method can be applied to combinations of days other than those that have been presented briefly. The time and effort involved in finding these combinations may be greater than if you used the general formula, I = Prt. Similarly, this method may be used where the rate of interest is other than 6%, however, the interest may be obtainable with greater ease with the general formula than the 60-day method. The more that you practice this method, the easier it will be for you to work. For example, compute the following:

   a. Find the interest on $600 at 3% for 54 days.
   Steps: I.

   $6.00 = 60 days' interest at 6% on $600
   —.60 = 6 days' interest ($^1/_{10}$ of 60 days)

   5.40 = 54 days' interest at 6% on $600
   2.70 = 54 days' interest at 3% on $600

   b. Find the interest on $750 at 2% for 129 days.
   Steps: I.

   $ 7.50 = 60 days' interest on $750
   .75 = 6 days' interest ($^1/_{10}$ of 60 days)
   .375 = 3 days' interest (½ of 6 days)

   16.125 = 129 days' interest at 6% on $750
   5.375 = 129 days' interest at 2% on $750
   (2% is 1/3 of $16.125)

The conclusion that may be drawn from this very brief introduction of interest problems is that the latter method is far too complicated to use. This conclusion would be valid if you did not use it often and master the method as well as you have the general formula, I = Prt. You may want to study a wide variety of problems available in any of the current texts listed in the bibliography for more examples of this method of computation.

PROBLEMS:

1. If the rate of interest is 7.8% per annum and the monthly interest payment is $65 on what principal are you paying?
2. You interest a prospective purchaser in a property for sale at $7,000.00. $1,000.00 is to be paid as a down payment and the balance in monthly installments of $50.00 each, plus taxes and interest at 5% per annum on the deferred balance. The prospect inquires, "How long will it take to retire the full purchase price?" Assuming that all interest and taxes were paid promptly when due, compute your answer.

Computation of Commission

INCOME FROM COMMISSIONS

In many lines of business including real estate, a salesman is paid on a commission basis; that is, instead of being paid a fixed salary, he is paid in proportion to the value of quantity of the goods or service that he sells. Commission on sales may be in the form of a certain uniform amount for each article sold or it may be a certain uniform per cent of the salesman's total sales. When a salesman's entire earnings are in this form, he is said to be paid a *straight commission.*

When the rate of commission is expressed as a per cent, the per cent is always based on the amount, or value, of the sales. Since the amount of sales is the base, this amount is multiplied by the per cent, or the rate of commission, to find the amount of the salesman's commission. The formula would be:

Rate of Commission × Sales = Commission

The conversion of per cents to decimal equivalent may cause some difficulty at this point. Remember that when the commission rate is quoted, say 6%, you must remove the per cent sign and move the decimal point two places to the left before proceeding further. The use of the per cent sign means hundredths and you think automatically—two places. For example: 65% would be .65; or 2% would be .02; or 6% = .06.

8160

PROBLEMS:

1. A broker is to receive a 6% commission on a $15,000 sale. How much commission will he earn?
   Steps: a. Translate the per cent, 6%, into decimal form or .06.
   b. Multiply the sale price, $15,000 by .06 and it would equal $900.00.
2. Albert Timmers, a real estate salesman for the Smith Realty Co., sold 5 building lots at $675.00 each, 9 at $850.00 each, and 7 at $1,075 each. If his commission rate was 6%, what was his total commission?
3. It is agreed that all commission collected by the office on sales made by a salesman are to be divided as follows: 10% to the sales manager and the balance to be divided equally between the broker and the salesman. The salesman closes a deal on which the sales price is $9,500 and the office collects a 6% commission on the sales price. What amount of commission is due the salesman?

ANSWERS TO PROBLEMS

Computation of Areas
2. $1,169.53 (by fraction $1,169.47)
3. $240
4. 80 acres
5. $96.12

Computation of Taxes
2. $500
3. $261.12
4. $377

Calculation of Depreciation
2. $9,000
3. $30,000

Pro-Ration of Insurance and Taxes
2. Seller to pay $62.50 of the taxes. Buyer to pay seller $30 of the insurance premium and pay taxes of $312.50.

Investments in Real Estate
1. $456
2. $100; 5%
3. $79
4. $39,900
5. $134,814.81

Calculation of Interest
1. $10,000
2. 10 years

Computation of Commission
2. $1,113
3. $256.50

Arithmetic Review

Nearly all of the mathematical problems encountered in real estate deal with decimal or percentage numbers. A brief review of the fundamentals involved in such problems follows:

I. Fractions appear in different forms depending upon the use that is made of them.

A. Fractions such as ½, ⅓, ⅔, and ⅝ are known as *common fractions.* They are for everyday common use. For example, a person buys ½ of an acre of land, or measures a board to sixteenths of an inch.

B. Fractions in the decimal form, as .8 or .07 or .135 are known as *decimals.* They are for precise measurement.

C. Fractions in the *percent form* are the fractions of business and are very much like decimal fractions. The sign for this way of writing hundredths is %. Thus, we can use the sign that means hundredths in place of the decimal that shows hundredths. 7/100 = .07 = 7%. Because a percent is a decimal whose denominator is 100, we can write a decimal as a percent; or we can write a percent as a decimal. Also we can write a percent as a common fraction. And we can write a common fraction as a percent, provided we can express it with 100 as the denominator.

1. To *change a decimal to a percent,* we think: If our decimal is hundredths, we can show this with the percentage sign in place of the decimal point. .25 = 25% .09 = 9% Thus the rule for changing a decimal to a percent: move the decimal two places to the right, and write the sign (%) for percent.
2. To *change a percent to a decimal,* we leave off the percent sign and write the number as hundredths by moving the point two places to the left. 65% = .65 2% = .02 If a percent contains a fraction, let us see how to write it as a decimal.
   (if 1% = 1/100 or 10/1000, then ½% = 5/1000 or .005)
   16½% = .16½ = .165
   10¼% = .10¼ = .1025
   3⅓% = .03⅓ = .0333
   17⅛% = .17⅛ = .172
3. To change a fraction to a percent, simply change the fraction to hundredths. The point is dropped and the sign (%) is annexed. ½ = .5 = 50%
   If you do not know the decimal equivalent, figure it out. Let us take ⅛ as an example.
   .12½ = .125 = 12.5%
   8) 1.00

II. The procedure for placing the decimal is different for multiplying and dividing.

A. When multiplying decimal numbers, there are two steps to follow in determining where the decimal point will be.

1. Count the total places to the right of the decimal point in both the multiplier and the multiplicand.
2. Start at the right and point off in the product (answer) as many decimal places as there are in both the multiplier and multiplicand. For example:

multiplicand	.16	(2 places)
multiplier	× .7	(1 place)
	.112	(3 places)

B. When *dividing*, the place of the decimal will depend on if the divisor is a whole number or a decimal.

1. To divide a decimal by a *whole number*, place the point in the quotient above the point in the dividend. Divide as with whole numbers. An example would be:

.7 (quotient)
(divisor) 6) 4.2 (dividend)

2. When dividing by a decimal, change the decimal in the divisor to a whole number by multiplying it by 10, 100, or 1,000 (using the minimum to make the divisor a whole number), as well as multiplying the dividend by the same number. Doing these operations to both divisor and dividend does not change the answer: Example:

Divide 96 by .16

600. (quotient)
(divisor) 16) 9600. (dividend)

II. The application of these fundamentals is not difficult.

A. To find the percent of a number, change the percent to hundredths and multiply the number by the hundredths or decimal.

Example: Mr. X saves 15% of his salary, which is $3,600 per year. How much does he save each year?

$3,600
× .15
$ 540.

B. To find what part one number is to another, we make a fraction. The number asked about is the numerator. Or we divide. Then the number asked about is the dividend. The quotient may be expressed as a decimal or as a percent.

Example: Mr. Y had 20 acres, but then sold 5. What part of the acreage did he sell?

5/20 = ¼ = .25 = 25%

C. To find what percent one number is of another, the number asked about is the dividend (numerator) of the division problem.

Example: 20 is what percent of 25. We put the 20, the number asked about, in the dividend. We then divide 20 by 25 = .80 or 80%.

To find the percent of each item to a total, divide I by the total, then multiply each item by the answer.

IV. Here is a "tying together" formula which will help you.

A. When the fraction is expressed as a percent, these terms are called: the base (b); the rate percent, or the rate (r); and the percentage (p).

B. The terms can be fit into a formula in one of three ways, each capable of describing a solution for one of the three types of percent problems.

1. Problems of the first kind: Find 25% of 48. We know the base (48) and rate (.25), and we are to find the percentage. To find the percentage, this formula is used.

Percentage = rate × base, or p = rb;

48 (b)
× .25 (r)
12 (p)

2. Problems of the second kind: 12 is what percent of 48? The base and the percentage are known, and we are to find the rate. To find the rate:

Rate = percentage ÷ base, or r = p ÷ b, or $r = \frac{p}{b}$

$$\frac{12\ (p)}{48\ (b)} = 25\%\ (r)$$

3. Problems of the third kind: What is the number if 25% of it is 12? The example gives us the rate (25%) and the percentage (12), and asks us to find the base. To find the base:

Base = percentage ÷ rate, or b = p ÷ r, or $b = \frac{p}{r}$

$$\frac{12\ (p)}{25\%\ (r)} = 25\overline{)\ 1{,}200}\ \ 48.$$

4. A problem using all three of the above illustrations:

Mr. A owned 2,400 acres of timber last year, but recently sold 75% of it. How many acres did he sell?

Base is 2,400 (Base—percentage—rate)

The rate is 75% (Rate—percentage—base)

The percentage is 1,800 (Percentage—base × rate).

"TRUE" ANNUAL INTEREST ON CERTAIN INSTALLMENT LOANS

Certain installment loans have a way of working "magic" on the interest rate figured on the loan's declining balance.

There are two types of such loans: 1. The "add-on" loan in which the interest is added to the original amount for division into monthly payments and, 2. the "discount" loan in which the interest is subtracted from the amount the borrower gets.

Stated Rate	"True" annual rate on money borrowed for:			
On an "add-on" loan	12 months	18 months	24 months	36 months
4%	7.4%	7.6%	7.7%	7.8%
5%	9.2%	9.5%	9.6%	9.7%
6%	11.1%	11.4%	11.5%	11.7%
8%	14.8%	15.2%	15.4%	15.6%
On a "discount" loan				
4%	7.7%	8.1%	8.3%	8.8%
5%	9.7%	10.2%	10.7%	11.4%
6%	11.8%	12.5%	13.1%	14.2%
8%	16.1%	17.2%	18.3%	20.5%

Linear and Spacial Measurements Used In Appraising and Land Descriptions

COMMON LINEAR MEASURE (LONG)

12 inches = 1 foot
3 feet = 36 inches = 1 yard
5½ yards = 16½ feet = 1 rod
40 rods = 1 furlong
8 furlongs = 320 rods = 1760 Yards = 5280 feet = 1 mile
3 miles = 1 league

CHAIN MEASURE

7.92 inches = 1 link
100 links = 66 feet = 1 chain
10 chains = 1 furlong
80 chains = 1 mile

(These are old surveyors' measurements. Modern surveyors use a steel tape or what is called an engineer's chain which is 100 feet long with links of one foot. Thus, a mile measure with a modern steel tape chain is 52.8)

SURVEYORS' MEASURE (AREA)

625 sq. links = 1 sq. pole
16 sq. poles = 1 sq. chain
10 sq. chains = 160 sq. rods = 43,560 sq. feet = 1 acre
640 acres = 1 sq. mile = 1 section
36 sections = 36 sq. miles = 1 township
¼ section = 160 acres

Area of a square or rectangle = length × width in unit of linear measurement used.

Area of a triangle = base × ½ altitude.

(An acre is an odd and inconsistent measurement. It is supposed to have been the amount of land that a farmer could plow in a day with an oxen and the old wooden plow. As a square it is approximately 208.71 feet on a side. To convert square feet to acres multiply by .000023.)

SQUARE MEASURE (AREA = LENGTH × WIDTH)

144 sq. inches = 1 sq. foot
9 sq. feet = 1 sq. yard
30¼ sq. yards = 1 sq. rod = 272¼ sq. feet
160 sq. rods = 4840 sq. yards = 43,560 sq. feet = 1 acre

CUBIC MEASURE (VOLUME = LENGTH × WIDTH × HEIGHT)

1728 cubic inches = 1 cubic foot
27 cubic feet = 1 cubic yard
128 cubic feet = 1 cord of wood (a pile 8′ × 4′ × 4′)
1 cubic yard of earth = 1 load
1 cubic foot of water = 7½ gallons = weighs 62½ pounds (avoirdupois)

CIRCULAR MEASURE

360 degrees in a circle
60 minutes = 1 degree
60 seconds = 1 minute

MISCELLANEOUS MEASURE

1 hair's breadth = 1/48th of 1 inch
1 hand = 4 inches
1 span = 9 inches
1 space = 3 feet
1 furlong = 660 feet
1 knot (nautical mile) U.S. = 6,080.2 feet
1 board foot = 144 cubic inches (12 × 12 × 1)
1 cord foot = 16 cubic feet (4 × 4 × 1)
31½ gallons = 1 barrel = 126 quarts
2 barrels = 1 hogshead = 63 gallons = 252 quarts
1 bushel = 4 pecks = 2150.42 cubic inches

The unit in measuring land is the acre, except for a city lot.

A square used in roofing is 100 square feet.

The unit used in measuring surfaces other than land is the square yard.

DEFINITION OF REAL ESTATE WORDS AND PHRASES IN COMMON USE

ABATEMENT - To reduce in amount; to lift; a tax rebate.

ABSTRACT OF TITLE - The history of the chain of title of a specific property.

ACCELERATION CLAUSE - Clause in a mortgage giving lender right to call all sums owing him to be immediately due and payable upon the happening of a certain event, normally a default.

ACCEPTANCE - Act of the seller or agent's principal in agreeing to the terms of the agreement of sale and approval of the negotiations on the part of the agent and acknowledges receipt of the deposit in subscribing to the agreement of sale; the act of accepting an offer which results in a binding contract.

ACCESS RIGHT - The right of an owner to have ingress and egress to and from his property.

ACCESSION - The process whereby property, belonging to one person becomes the property of another by reason of its being added to or incorporated with the property of the latter.

ACCRETION - Addition to the land through natural causes; a slow build up of lands by natural forces such as wind, wave or water.

ACCRUED DEPRECIATION - The difference between the cost of replacement new as of the date of the appraisal and the present appraised value. A fundamental of the cost approach. The highest courts have repeatedly held that the "observed condition" method of estimating accrued depreciation should be accorded the greatest weight.

ACKNOWLEDGMENT - A formal declaration before a duly authorized officer by a person who has executed an instrument that such execution is his act and deed; necessary for recording of an instrument.

ACQUISITION - The act or process by which a person procures property.

ACRE - A measure of land equaling 160 square rods, or 4,840 square yards, or 43,560 square feet, or a tract about 208.71 feet square.

ACRE FOOT - A unit of water measure. The volume of water required to cover an acre of land one foot deep, or 43,560 cubic feet of water, or 325,851 gallons.

ACTION - A proceeding in a court of justice for the enforcement or

81646

protection of a right, the redress or prevention of a wrong or the punishment of a public offense; a case at law.

ACTIONABLE - A term used to describe incidents or circumstances that are grounds for instituting legal action or lawsuit.

ACTUAL AGE - Chronological age of a structure.

AD VALOREM TAX - Literally means according to value and is an assessment of taxes against a property.

ADJACENT - Lying near or close by; neighboring; boundaries of two properties may or may not touch.

ADJOINING - Contiguous; touching; in actual contact with.

ADJUDGE - To pass on judicially; to decide, settle or decree by court decision; to sentence or condemn.

ADMINISTRATION OF AN ESTATE - The management and settlement of the estate of a deceased person.

ADMINISTRATOR - A person appointed by a court to administer the estate of a deceased person who left no will, that is, who died intestate; also chief officer of a governmental department, such as the Real Estate Commissioner.

ADULT - One who has attained the age of majority or full responsibility.

ADVANCE FEE - Payment of compensation ahead of performance; sometimes a "racket" in which an owner pays a fee in the seldom realized expectation that vaguely described services will result in the sale of his property; a frequently attempted method to circumvent license law.

ADVERSE POSSESSION - The right of an occupant of land to acquire title against the real owner where possession has been actual, continuous, hostile, visible and distinct for the statutory period. (10 years in Oregon)

AFFIANT - A person who has made an affidavit.

AFFIDAVIT - A written statement respecting anything under the sun, signed and sworn to by the affiant before any officer authorized by law to administer oaths.

AFFIRM - To confirm, to aver, to ratify, to verify, to testify.

AGENCY - The relationship between principal and agent which arises out of a contract, either expressed or implied, written or oral, wherein the agent is employed by the principal to do certain acts in dealing with a third party.

AGENT - One who represents another from whom he has derived authority, such as a broker in regards to his principal, and a salesman in regards to his broker.

AGRARIAN - Pertaining to fields or lands, or their tenure.

AGREEMENT OF SALE - A written agreement whereby the purchaser agrees to buy certain real estate and seller agrees to sell upon terms and conditions set forth therein.

AIR RIGHTS - The ownership of the right to use, control or occupy the air space over a designated property.

ALIEN - A person who resides in one country and owes allegiance to another; a person born outside the jurisdiction of the United States who has not been naturalized under the Constitution and laws of this country.

ALIENATION - The transfer of property to another; the transfer of property and possession of lands, or other things, from one person to another.

ALIMONY - Allowance made by order of the court to a woman for her support, out of her husband's estate, in an action for divorce, separation or annulment, payable in periodic installments or lump sum.

ALLUVION - Soil deposited by accretion. Increase of earth on a shore or bank of a river. Usually considered as belonging to the owner of the land to which it is added.

AMENITIES - The satisfaction of enjoyable living to be derived from a home, or profit from income property; conditions of agreeable living or a beneficial influence arising from the location.

AMORTIZATION - A gradual extinction of a monetary obligation by periodic contributions to extinguish the debt together with the payment of interest thereon; recovery over a period of cost or value; or orderly process of recovery or liquidation.

ANIMAL UNIT - A grown beef or dairy animal or its equivalent. A calf is rated a half unit; 5 sheep are one unit.

ANIMAL UNIT MONTH - The amount of pasture required to graze an animal

unit for one month. Frequently expressed as "AUM". If 50 animal units could graze for 4 months, the pasture would be rated 200 AUM's.

ANNUITY - An annual income, or a series of regular, level periodic and sure payments; a sum of money or its equivalent that constitutes one of a series of equal periodic payments.

ANTICIPATION - An appraisal principal which affirms that value is created by anticipated benefits to be derived in the future; the taking or alienation, as by assignment, of the income of a trust estate before it is due.

APPEAL - The review of a case by a court of superior jurisdiction.

APPELATE COURT - A court having jurisdiction of appeals and reviews.

APPRAISAL - An estimate and opinion of value. The process through which conclusions of property value or property facts are obtained; also commonly the report setting forth such estimate and conclusion.

APPRAISAL APPROACH - The appraisal methods or avenues used in estimating market value. There are three: Market Data, Cost and Income.

APPRAISAL PROCESS - An orderly program for estimating the value of real estate; an orderly process to define the problem, the work necessary to solve the problem is planned, the date involved is acquired, classified, analyzed and interpreted into an estimate of value.

APPRAISER - One qualified by education, training and experience to estimate the value of real property; one who practices a judgment science.

APPRECIATION - An increase in value of property due to economic or related causes which may prove to be temporary or permanent.

APPURTENANCE - That which passes with the land incidentally to the sale of the property, such as a right of way.

ARBITRATION - The investigation and settlement of a matter of contention between opposite parties by a person or organization chosen by the parties.

ARCHITECTURE - An expert combination of mass, materials, openings and details.

ARSON - The intentional and malicious burning of a dwelling house or other building, or causing one to be burned.

ASSESSED VALUATION - The full cash value as defined by statute or a percentage thereof of real property.

ASSESSED VALUE RATIO - An appraisal method which considers the assessed value of the land as a percentage of the assessed value of improvements.

ASSESSMENT - A charge against real estate made by a unit of government to cover the proportionate cost of an improvement; also the valuation of property for the purpose of levying a tax.

ASSESSOR - The official who has the responsibility of determining assessed values.

ASSETS - All the property one possesses that may be made available for the payment of debts.

ASSIGN, ASSIGNEE - He who receives property from another by assignment, conveyance, devise, descent or act of law.

ASSIGNEE, ASSIGN - The person to whom an assignment of interest is made; also assigns.

ASSIGNMENT - A transfer in writing of an interest in real estate from one person to another.

ASSIGNOR - One who has the right and authority to assign and/or gives to another an assignment.

ASSUMPTION AGREEMENT - An agreement which provides for a third party to assume the mortgage of the mortgagor defaulting in his mortgage payments.

ASSUMPTION FEE - A charge made by the lender for correcting his records to show assumption of the liability by a third party.

ASSUMPTION LETTER - A statement of the status of all charges against the security for the loan at the time of the assumption by a third party.

ASSUMPTION OF MORTGAGE - The taking of title to a property by a grantee, wherein he assumes liability for payment of an existing note secured by a mortgage or deed of trust against the property; becoming a co-guarantor for the payment of a mortgage or deed of trust note.

ASSURED - A person indemnified by an insurance company against the loss described in the policy; the insured.

A.T.A. TITLE POLICY; Also known as ALTA - A type of title insurance policy issued by title insurance companies which expands the risks normally insured against under the standard type policy to include unrecorded mechanic's liens, unrecorded physical easements, facts a physical survey would show, water and mineral rights, and rights of parties in possession, such as tenants and buyers under unrecorded instruments.

ATTACHMENT - The act of taking or seizing property by court order, thus bringing it into the custody of the law during the process of an action.

ATTEST - To affirm to be true or genuine, an official act establishing authenticity.

ATTORNEY IN FACT - One who is authorized to perform certain acts for another under a power of attorney; power of attorney may be limited to a specific act or acts or be general.

ATTORNEYS LIEN - A lien or charge given by law upon a judgment or upon lands in those cases where an attorney has procured an award on behalf of his client.

AUTHENTICATION - The performance of certain acts upon or with reference to a written instrument, for the purpose of rendering it admissible in evidence as being what it purports to be, without other proof that it is such.

AVULSION - The sudden tearing away or removal of land by action of water flowing over or through it.

AWARD - A judgment, sentence or final decree.

BACKFILL - The replacement of excavated earth into a hole or against a structure.

BAILEE - Party who has possession during bailment.

BAILMENT - Transfer of personal property by one party to another for some specific purpose, to be returned at a stated time or upon completion of purpose for which transferred.

BAILOR - Party who transfers property in bailment.

BALANCE - An appraisal principle which affirms that balance maintains

value while imbalance destroys value. Value is created and maintained when there is proper equilibrium among the amount and location of essential uses.

BALLOON PAYMENT - Where the final installment payment on a note is greater than the preceding installment payments and pays the note in full.

BALLROOM APPRAISAL - See DUAL CONTRACTS.

BANKRUPTCY - Proceedings taken under the bankruptcy statute to have the assets of the bankrupt divided among his creditors.

BARGAIN AND SALE DEED - Deed which conveys the land described therein, but without any warranties whatsoever.

BASE AND MERIDIAN - Imaginary lines used by surveyors to find and describe the location of private or public lands.

BASE MOLDING - Molding used at top of baseboard.

BASE SHOE - Molding used at junction of baseboard and floor; commonly called a carpet strip.

BASEBOARD - A board placed against the wall around a room next to the floor.

BASELINE - A part of the "Rectangular System" for the states of Oregon, Washington and Idaho. The east and west survey line intersecting the Willamette Meridian. The line runs from the Pacific Ocean into the State of Idaho. Lines surveyed every 6 miles parallel to the base line help form the boundaries of townships.

BATTEN - Narrow strips of wood or metal used to cover joints, interiorly or exteriorly; also used for decoration effect.

BEAM - A structural member transversely supporting a load.

BEARING WALL OR PARTITION - A wall or partition supporting any vertical load in addition to its own weight.

BENCH MARKS - A location indicated on a durable marker by surveyors.

BENEFICIAL RIGHTS - The rights of occupancy of a tenant.

BENEFICIARY - One entitled to the benefit of a trust; the lender on the security of a note and trust deed.

BEQUEATH - To give personal property to another by will; distinguished from devise, which relates to real property.

BEQUEST - Transfer of personal property under a will; distinguish from devise, which relates to real property.

BETTERMENT - An improvement in a property which is considered to add to the investment of capital cost - as distinguished from repairs or replacements where the original character or cost is unchanged.

BILL OF SALE - A written instrument transferring to a buyer the title to personal property.

BINDER - A written agreement to cover a down payment for the purchase of real estate as evidence of good faith on the part of the purchaser.

BLACKTOP - Asphalt paving used in streets and driveways.

BLANKET MORTGAGE - A single mortgage on two or more parcels or real estate as security for a single loan.

BLIGHTED AREA - A declining area in which real property values are seriously affected by destructive economic forces, such as encroaching inharmonious property usages, infiltration of lower social and economic classes of inhabitants, and/or rapidly depreciating buildings.

BLUE RIBBON JURY - A jury chosen for its outstanding qualifications, and used to consider cases of special importance.

BOARD FOOT - Unit of measurement of lumber; one foot wide, one foot long, one inch thick; 144 cubic inches.

BONA FIDE - In good faith, without fraud; genuine.

BONA FIDE HOLDER FOR VALUE - One who takes a negotiable instrument in good faith for a valuable consideration in the ordinary course of business before it is due.

BONA FIDE PURCHASER - One who buys for a valuable consideration with the belief that the seller has a right to sell and with no knowledge of any impediments to the transfer.

BOND - Any obligation under seal; a real estate bond is a written obligation, usually issued on security of a mortgage or a trust deed.

BRACING - Framing lumber nailed at an angle in order to provide rigidity.

BRANCH OFFICE - A licensed real estate office, other than the principal place of business, of a licensed real estate broker. The "branch office license" must be displayed at the branch office. Licenses of associated brokers or salesmen, in charge of or working from the branch office, must be displayed at the broker's main place of business.

BREACH - The breaking of a law, or failure of a duty, either by commission or omission.

BRIDGING - Small wood or metal pieces used to brace floor joists.

B.T.U. - British thermal unit. The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit.

BROKER - One employed by another, for a commission or other compensation, to carry on any of the activities listed in the Oregon real estate license law definition of the word.

BUDGET MORTGAGE - A variation of the amortizing mortgage, which includes in the monthly payments of principal and interest other costs, such as taxes and fire insurance.

BUILDING CODE - Regulates the construction of buildings within a municipality by ordinance or law.

BUILDING LINE - A line fixed by law at a certain distance from the boundaries of a lot, beyond which no buildings can project.

BUILDING PAPER - A heavy waterproofed paper used as sheathing in wall or roof construction as a protection against air passage and moisture.

BUILT-IN CABINETS - Cabinets or similar features built as part of the house.

BULK SALES LAW - An Oregon law requiring the purchaser of any commercial business to demand and receive from the seller an affidavit containing the names and addresses of all creditors of the seller. The purchaser then, at least 10 days before closing, is obliged to notify the creditors of the proposed purchase. Its purpose is to protect the purchaser. (Now part of Uniform Commercial Code)

BUNDLE OF RIGHTS - The theory holding that ownership of real property may be compared to a bundle of sticks, each stick representing a distinct and separate right or privilege. They are the right to use, to sell, to lease, to enter, to give away, or right to refuse to take action.

BUYING BY ASSUMING AND AGREEING TO PAY - Assuming personal liability.

BUYING SUBJECT TO - No personal liability assumed.

CAPITAL - Wealth; the cost of interest on and recapture of an investment.

CAPITAL ASSETS - The term "capital assets" has a special meaning in income tax law. Generally, it is distinguishable from "inventory" which comprises assets held for sale to customers in the ordinary course of the taxpayer's trade or business. "Capital gains" - gains from sale or exchange of capital assets - are taxed at not more than 25% after being offset by capital losses.

CAPITAL GAINS - Capital gains are gains from sale or exchange or "capital assets" as that term is defined above. "Long-term capital gains" are subject to a special alternative tax of 25% of the amount of such capital gains if, and only if, that tax would be lower than a tax computed by including such capital gains in the taxable income taxed at the regular income rates. Depreciable assets and certain other noncapital assets held for more that 6 months are treated as if they were capital assets if their sale or exchange collectively results in a net gain.

CAPITAL LOSSES - Capital losses are losses from sales of capital assets. A corporation may deduct capital losses of any taxable year in that year only to the extent of capital gains. The excess may be carried over to succeeding years for five years but only as an offset against capital gains of such later years. If there are no such capital gains, the deduction is lost. Individuals are treated similarly, except that each year, including the year of the loss and the next five years, they may deduct capital losses against their taxable income (computed without regard to capital gains and losses and without regard to the personal exemptions) up to $1,000 each year.

CAPITAL STOCK - The sum of money raised by the subscriptions of stockholders and divided into shares.

CAPITALIZATION - A process whereby we convert income into value; the act or process of converting future incomes into current equivalent capital value; also the amount so determined. Income

8173

divided by rate equals value.

CAPITALIZATION RATE - Percent figure used to evaluate an income flow and convert it into a capital amount; the product of an interest rate on an investment and the recapture rate for return of an investment.

CAPITALIZATION RECAPTURE - The return of an investment.

CASE - A general term for actions or suits at law or in equity.

CASEMENT WINDOW - Frames of wood or metal which swing outward.

CAUSE OF ACTION - The ground on which a lawsuit can be sustained.

CAVEAT EMPTOR - Let the buyer beware. The buyer must examine the goods or property and buy at his own risk.

CAVEAT WARNING - Let him beware.

CERTIFICATE OF SALE - Document issued to the highest bidder at a foreclosure sale.

C.P.E. - Certified Property Exchanger.

C.P.M. - Certified Property Manager; a member of the Institute of Real Property Management of the National Association of Real Estate Boards.

CERTIORARI - A proceeding to review in a competent court the action of an inferior tribunal, board or officer exercising judicial functions, when such action is alleged to be without jurisdiction, or otherwise illegal.

CHAIN - A term of land measurement being 66 feet in length.

CHAIN OF TITLE - A history of conveyance and encumbrances affecting the title from the time the original patent was granted, or as far back as records are available.

CHANGE - An appraisal principle which affirms that all existence is characterized by three stages - integration, equilibrium and degeneration.

CHATTEL - Personal property, such as household goods, stock or equipment.

CHATTEL MORTGAGE - A pledge of personal property as security for the

performance of an act or payment of an obligation; now known as a "security agreement" under the Uniform Commercial Code.

CHATTEL REAL - An estate related to real estate, such as a lease on real estate.

CIRCUIT BREAKER - An electrical device which automatically intercepts an electric circuit when an overload occurs; may be used instead of a fuse to protect each circuit and can be reset.

CIRCUMSTANTIAL EVIDENCE - Facts that establish a condition or circumstances from which the principal fact is a possible conclusion.

CITATION - A writ commanding a person to appear before a named judicial tribunal or officer on a day named.

CITIZEN - One who under the Constitution and laws of the United States, by virtue of birth or naturalization, owes allegiance to his country and is entitled to the enjoyment of full civil rights in the United States.

CIVIL RIGHTS - Rights of a non-political nature, secured by the Thirteenth and Fourteenth Amendments to the Constitution of the United States or by various state or federal statutes.

CLAPBOARD - Boards usually thicker at one edge used for siding.

CLEAR TITLE - A title free and clear of all encumbrances.

CLOSING STATEMENT - An accounting of funds made by the broker to the seller and buyer separately, and required by law to be made at the completion of every real estate transaction. An exact copy must be retained by the broker.

CLOUD ON THE TITLE - An outstanding claim or encumbrance which, if valid, would affect or impair the owner's title, such as a judgment, dower interest; some irregularity such as would cast a doubt on validity of title; usually removable by quit claim deed or court action.

CODICIL - A supplement to a will; becomes a part of original.

COLLAR BEAM - A beam that connects the pairs of opposite roof rafters above the attic floor.

COLLATERAL SECURITY - A separate obligation attached to a contract to guarantee its performance; the transfer of property or of other

contracts or valuables to insure the performance of a principal agreement.

COLLUSION - An agreement between two or more persons to perpetrate a fraud.

COLOR OF TITLE - That which appears to be good title but which is not title in fact.

CO-MAKER - A person who signs or endorses the promissory note of another before delivery of the note to the payee.

COMBED PLYWOOD - A grooved building material used primarily for interior finish.

COMMERCIAL ACRE - A term applied to the remainder of an acre of newly subdivided land after the area devoted to streets, sidewalks, curbs, etc., has been deducted from the acre.

COMMERCIAL PAPER - Bills of exchange used in commercial trade.

COMMINGLE - To mingle or mix, such as a deposit of client's funds in the broker's personal account.

COMMISSION - An agent's payment for the performance of specific duties, as the percentage of sales price paid for selling a property. An administrative and regulatory body of real estate license laws.

COMMITMENT - A pledge or a promise; a firm agreement.

COMMITTEE OF INCOMPETENT - Person or persons invested by order of court with the guardianship of the person or estate of one adjudged an incompetent or lunatic.

COMMON LAW - The body of law that grew from customs and practices developed and used in England. It is contrasted with and opposed to "Statutory Law". "Common Law" will prevail in Oregon unless such law has been abrogated by statutory law.

COMMUNITY PROPERTY - Property accumulated through joint efforts of husband and wife living together. This interest does not exist in Oregon.

COMPACTION - Whenever soil is added to a lot to fill in low places or to raise the level of the lot the added soil is often too loose and soft to sustain the weight of buildings. It is then necessary to compact the added soil.

COMPANY - An association of persons, whether incorporated or not, for the purpose of carrying on some business.

COMPETITION - An appraisal principle which holds that profit tends to create competition, which can dissipate all or part of the profit.

COMPLAINANT - One who applies to the courts for legal redress.

COMPOUND INTEREST - Interest paid on the original principal and also on the accrued and unpaid interest which has accumulated.

COMPOUND SUM - Amount of an obligation at maturity, including principal and unpaid interest compounded.

COMPROMISE - An agreement made either in or out of the courts for a settlement of a dispute.

CONDEMNATION - Taking private property for public use, with compensation to the owner, under eminent domain.

CONDITION OR CONDITIONS - A proviso in a Deed or Will that upon the happening or failure to happen of a certain event, the title of the purchaser or devisee will be limited, enlarged, changed or terminated.

CONDITIONAL COMMITMENT - A commitment of a definite loan amount for some future unknown purchaser of satisfactory credit standing.

CONDITIONAL SALE CONTRACT - A contract for the sale of property providing for delivery to the buyer, but title remaining vested in the seller until the conditions of the contract have been fulfilled.

CONDOMINIUM - The individual ownership of a single unit in a multi-unit development with common ownership of halls, stairs, elevators, driveways, parks, etc. Each owner is responsible for his own taxes and mortgage payments on his unit and a proportionate share of taxes and expenses on common elements.

CONDUIT - Usually a metal pipe in which electrical wiring is installed.

CONFESSION OF JUDGMENT - An entry of judgment upon the debtor's voluntary admission or confession.

CONFORMITY - An appraisal principle which holds that the maximum of value is realized when there is reasonable uniformity, social as well as economic.

CONSERVATOR - A person appointed by the court to protect and preserve the lands and property of an individual physically incapacitated or otherwise not able to handle his own affairs.

CONSIDERATION - Anything of value given to induce entering into a contract; it may be money, personal service, or even love and affection.

CONSTANT - The cash flow requirement to liquidate a mortgage.

CONSTRUCTIVE NOTICE - Notice given by the public records.

CONTEMPT - A willful disregard of the authority of a court of justice or legislative body or disobedience of its lawful order.

CONTIGUOUS - An area touching upon another; properties having a common boundary.

CONTRACT - A legally enforceable agreement, either written or oral, to do or not to do certain things. All contracts pertaining to real property must be in writing.

CONTRACT MILKING - Representing that the contract or note secured by trust deed can only be sold for big discount, selling it for lower discount, and pocketing the difference.

CONTRACT OF SALE - See AGREEMENT OF SALE.

CONTRACT RENT - Rent stipulated in a lease, usually for a long term, or a series or renewable short term leases.

CONTRIBUTION - An appraisal principle which affirms that the value of an item in production is measured by its contribution to the net return of the enterprise.

CONVENTIONAL LOAN - A "tailored" flexible mortgage contract developed by savings and loan associations; a loan not insured or guaranteed by the federal government.

CONVERSION - Change from one character or use to another; change of real property or personal property.

CONVERT - To assume or exercise the right of ownership over another's goods.

CONVEYANCE - The means or medium by which title to real estate is transferred, another term for deed.

CONVEYANCING - The art or science of transferring, by written instrument, the title to real estate from one person to another.

COOPERATIVE - A type of ownership of real property where ownership of a portion of the building equity entitles the owner-tenant to a long-term lease on the apartment.

COORDINATION - The cost of management and overhead.

CORPORATION - A group or body of persons established and treated by law as an individual or unit with rights and liabilities or both, distinct and apart from those of the persons composing it.

CORPOREAL - Pertains to a right or group of rights of a visible and tangible nature.

CORRECTION DEED - A writing correcting an error, frequently typographical, in a recorded deed - Example: "This deed has been corrected and initialled by the parties thereto and is re-recorded to show correction of a typographical error in the middle initial of the grantee, Mary D. Smith."

CORRELATION - Co-relating facts and data, and bringing them together.

COST - That which is expended to create or acquire.

COST APPROACH - One of three appraisal methods of estimating value. The value estimate is obtained by estimating value of land as if vacant, and adding to estimated current cost of reproducing the existing improvements, less the estimated depreciation from all causes; usually held to fix the upper limit of value.

COST OF REPRODUCTION NEW - The normal cost of exact duplication of a property with the same or closely similar materials as of a certain date or period.

COUNSEL - In the language of the law, means legal advice; also a lawyer or lawyers engaged to give such advice, or to conduct a cause in court.

COUNTERFLASHING - Flashing used on chimneys at roofline to cover shingle flashing and to prevent moisture entry.

COVENANT - An agreement written into deeds and other instruments promising performance or nonperformance of certain acts, or stipulating certain uses or non-uses of the property.

COVENANT FOR QUIET ENJOYMENT - The right of an owner to the use of property without interference of possession.

COVERTURE - The legal condition or state of a married woman at common law.

CRAWL HOLE - Exterior or interior opening permitting access underneath building, as required by building codes.

CREDITOR - A person to whom a debt is owed by another person who is called the debtor.

CUBIC FOOT - The volume contained in a cube measuring one foot wide, one foot long, and one foot high; equals 7.4805 gallons of water.

CUL-DE-SAC - A street or lane open at one end only and usually having a "turn-around" at the closed end.

CURABLE DEPRECIATION - Any defect that can be cured. It is measured by the cost to cure.

CURB RIDER - Nomadic licensee operating with only nominal or no office location.

CURTAIL SCHEDULE - A listing of the amounts by which the principal sum of an obligation is to be reduced by partial payments and of the dates when each payment will become payable.

CURTESY - A life estate in an undivided one-half interest in the lands of his deceased wife which the law of Oregon gives to a widower.

DAMAGES - The indemnity recoverable by a person who has sustained an injury, either in his person, property, or relative rights, through the act or default of another.

DEBTOR - A person who owes money or something else of value.

DECEDENT - One who is dead.

DECIDUOUS TREES - Lose their leaves in the autumn and winter.

DECISION - The judgment or decree of a court.

DECK - Usually an open porch on the roof of a ground or lower floor, porch or wing.

DECREE - Final determination of the rights of the parties to a suit.

8180

DECREE OF FORECLOSURE - Decree by a court on the completion of foreclosure of a mortgage, contract or lien.

DECREMENT - Quantity lost by gradual diminution or waste.

DEDICATION - An appropriation of land by an owner to some public use together with acceptance for such use by or on behalf of the public.

DEED - An instrument in writing which when executed by the grantors and delivered to the grantee conveys the described real estate from the one to the other.

DEED, BARGAIN AND SALE - A deed which conveys the land described therein, but without any warranties whatsoever.

DEED, GENERAL WARRANTY - A deed which not only conveys the lands described therein, but in which the grantor makes certain "warranties", usually to the effect that he has good right to convey, that the land is free of encumbrances, except as stated, and that he will defend the title against the lawful claims of all persons.

DEED, QUITCLAIM - A deed that releases or quitclaims all of the right, title and interest, if any, of the grantor in the land described therein.

DEED, SHERIFF'S - Document given to holder of Sheriff's Certificate at conclusion of period of redemption.

DEED, SPECIAL WARRANTY - A deed in which the grantor warrants only against his own acts and the claims of persons claiming by, through or under him.

DEFAULT - Failure to fulfill a duty or promise or to discharge an obligation; omission or failure to perform an act.

DEFEASANCE - The fulfillment of a condition in a legal document which has the result of nullification of that document.

DEFENDANT - The party sued in an action at law.

DEFERRED MAINTENANCE - Existing but unfulfilled requirements for repairs and rehabilitation.

DEFERRED PAYMENTS - Money payments to be made at some future date.

DEFICIENCY JUDGMENT - A judgment of the court against the defaulting

8181

mortgagor for the difference between the indebtedness sued upon and the sale price or market value of the real estate at the foreclosure sale.

DELINQUENCY - Failure, omission or violation of duty, as a delinquency in regard to the monthly payment on a mortgage loan.

DELIVERY - The final and absolute transfer of a deed from seller to buyer in such a manner that it cannot be recalled by the seller. A necessary requisite to the transfer of title.

DEMAND LETTER - See FORWARDING FEE.

DEMISE - The transfer of an estate to another for years, for life, or at will; or by lease.

DEPRECIATED VALUE - The value of a property after deducting depreciation.

DEPRECIATION - Loss in value brought about by deterioration through ordinary wear and tear, action of the elements, or functional or economic obsolescence; a loss in value from any cause.

DEPRECIATION BASE - Cost (or other value) of base to be amortized annually.

DEPTH TABLE - One of a number of "rule of thumb" used by assessors and others in making adjustments for variations in lot shapes, depths and location in the block. The theory that land varies directly with the depth, but that each succeeding unit of depth adds less value than the preceding unit. The 4-3-2-1 theory.

DESCENT - In law, the passage of real estate, upon the death of the owner, to his heirs at law.

DETERIORATION - Impairment of condition. One of the causes of depreciation and reflecting the loss in value brought about by wear and tear, disintegration, use in service, and the action of the elements.

DEVISE - A gift of real property by last will and testament.

DEVISEE - One who receives a bequest made by a will.

DEVISOR - One who bequeaths by will.

DIRECT REDUCTION LOAN - A loan repayable in consecutive equal monthly payments of interest and principal sufficient to retire the debt within a definite period. "Direct" actually means that

after the monthly interest payment has been taken out of the payment, the balance of the loan payment is applied directly to the reduction of the principal of the loan.

DIRECTIONAL GROWTH - The location or direction toward which the residential sections of a city are destined or determined to grow.

DISCHARGE IN BANKRUPTCY - The release of the bankrupt from the obligations of his debts which were, or might have been, proved in bankruptcy proceedings.

DISCOUNT - In financing, the discount is an amount discounted from the loan by the lending agency, usually paid by the seller as a bonus to the lending institution, and usually figured as a certain percentage of the amount to be repaid; varies according to the character of the current money market and the amount of risk involved.

DISCRETION - Freedom in the exercise of judgment.

DISCRIMINATION - An unfair or injurious treatment; (sometimes unlawful).

DISPOSSESS - To deprive one of the use of real estate.

DIVEST - To dispossess.

DOCKETED JUDGMENT - A judgment listed in the formal records of a court or county records.

DOCUMENTARY EVIDENCE - Evidence in the form of written or printed papers.

DOCUMENTARY STAMP - A revenue stamp issued for the payment of a tax on documents, such as deeds, checks or wills.

DOMICILE - The place where one has his true, fixed and permanent home, and to which he has the intention of returning whenever he is absent.

DLC, DONATION LAND CLAIM - The land allocated to an Oregon settler under a federal law of 1850. The allocations were for 320 or 640 acres.

DONEE - One to whom property is given.

DONOR - The giver of property.

8183

DOUBLE ESCROW - See DUAL CONTRACTS.

DOUBLE INDEMNITY - The provision in an insurance policy that under certain conditions the insurance company will pay to the beneficiary under the policy twice the face amount of the policy.

DOWER - A life estate in an undivided one-half interest in the lands of her deceased husband which the law of Oregon gives to a widow.

DROP-RATE - Reduction of interest rate at regular intervals provided under the Savings and Loan Mortgage Plan.

DUAL CONTRACTS - Term used to characterize misrepresentation of purchase price and/or down payment through a spurious deposit receipt, to obtain loan or higher loan from lender.

DUE PROCESS OF LAW - The law in its regular course of administration through the courts of justice.

DURESS - Unlawful constraint exercised upon a person whereby he is forced to do some act against his will.

EARNEST MONEY - Down payment made by a purchaser of real estate as evidence of good faith.

EARNEST MONEY RECEIPT OR AGREEMENT - The most important document in a real estate office. It serves as a receipt for a down payment or "hand money", an offer to purchase, as a contract of sale or a contract to sell, sets forth the time and method of closing, contains instructions to the broker, provides for disposition of the "hand money" in the event of forfeiture, and fixes the broker's compensation.

EASEMENT - The right, privilege or interest which one party has in the land of another; an encumbrance or limitation on property. It is extinguished by release, abandonment, or when the necessity no longer exists.

EASEMENT, APPURTENANT - Something held in connection with an easement.

EASEMENT, DOMINANT - The land benefitting by an easement.

EASEMENT, ENGROSS - Not connected.

EASEMENT, PERSONAL - Similar to a license.

EASEMENT, SERVIENT - The land upon which the easement is given.

EAVES - The lower part of a roof projecting over the wall.

ECONOMIC DEPRECIATION - Loss of value from all causes outside the property. (Too heavy traffic, a new service station in a residential area, one-way traffic.)

ECONOMIC LIFE - That period for which a property is good for its present or intended use; the period over which a property will yield a return on the investment, over and above the economic or ground rent due to land.

ECONOMIC OBSOLESCENCE - Loss of value due to economic causes. These are changes external to the property, such as social changes, property taxes, or legislation.

ECONOMIC RENT - The rent a property can command in the open market if it is vacant and ready to be leased today. Also see GROUND RENT.

ECONOMIC SIZE - Buildings of the proper size, no over or under improvement.

EFFECTIVE AGE - The age a property appears to be when compared to one that is known.

EFFECTIVE GROSS INCOME - The income remaining after the deduction from gross income of vacancy and credit losses.

EGRESS - The right to leave a tract of land. Often used interchangeably with access.

EJECTMENT - The name of an action wherein the plaintiff seeks to recover from the defendant the possession of real property, with damages for the unlawful detention of the same.

EMBLEMENTS - Right of tenant farmer to go on the land to harvest his crops.

EMINENT DOMAIN - The authority of the government, local, state or federal, in which private property may be taken for public use, and under which the owner is paid a just compensation.

EMPLOYMENT CONTRACT - The vital portion of what is commonly known as a "listing". A written agreement employing a real estate broker, for value received, to perform certain specified services and fixing the amount of his compensation. All of the essentials of

a contract are necessary in this document. In order to establish a claim for a commission there must be an employment contract in writing.

ENCROACHMENT - A building, part of a building or obstruction which intrudes upon or invades or trespasses upon property of another; displacement of an existing use.

ENCUMBER - To burden a parcel of land with a lien or charge such as a mortgage.

ENCUMBRANCE - A claim, lien, charge, or liability attached to and binding upon real property, such as a judgment, unpaid taxes, or a right of way.

ENDORSEMENT - The act of signing one's name on the back of a check or note, with or without further qualification.

ENTIRETY - An estate in land held by husband and wife resulting in sole ownership by the survivor upon the death of one or the other. See ESTATE.

EQUITEER - See MORTGAGE CLIPPING.

EQUITY - The dollar interest one has in real estate above the encumbrance; a system of law that grew side by side with the English common law, and provided relief when no legal remedies were available. Oregon administers both in the same court, with separate law and equity dockets.

EQUITY OF REDEMPTION - Right of original owner to reclaim property sold through foreclosure proceedings by payment of debt, interest and costs.

EROSION - The wearing away of land through processes of nature, such as by streams and winds.

ESCALATOR CLAUSE - A clause in a contract providing upward or downward adjustment of certain items to cover contingencies.

ESCHEAT - Reversion of property to the state by reason of failure of persons legally entitled to hold, or lack of heirs.

ESCROW - A deposit of instruments and funds with written instructions to a neutral third party to carry out the provisions of an agreement or contract; an escrow presupposes the existence of a valid contract, with sufficient parties, a proper matter, and a consideration.

2018 8186

ESCROW AGENT - Any person engaged in the business of receiving escrows for deposit or delivery for compensation.

ESTATE - A right in property. An estate in land is the degree, nature or extent of interest which a person has in it.

ESTATE IN SUFFERANCE - The wrongful occupation of lands and tenements by a tenant after his rightful possession has expired.

ESTATE FOR LIFE - A freehold estate, not of inheritance, but which is held by the tenant for his own life, or the life or lives of one or more other persons, or for an indefinite period which may endure for the life or lives of persons in being and beyond the period of life.

ESTATE FOR YEARS - An interest in lands by virtue of a contract for the possession of the property for a definite and limited time. A lease may be said to be an estate for years.

ESTATE IN REVERSION - The residue of an estate left in grantor to commence in possession after termination of some specific estate granted by him. In a lease, the lessor has the estate in reversion after the lease is terminated.

ESTATE OF INHERITANCE - An estate which may descend to heirs. All freehold estates are estate of inheritance, except estates for life.

ESTATE OF WILL - The occupation of land and tenements by a tenant for an indefinite period, terminable by one or both parties.

ESTOPPEL - A bar to one's asserting or denying a fact because of one's own previous action, by which the contrary has been admitted, implied, or determined.

ESTOPPEL CERTIFICATE - A document used in the assignment of a mortgage in which the owner certifies that the mortgage is a lien for the amount stated and that there are no defenses to the mortgage.

ET UX - Means - and wife; ET AL - means - and others.

ETHICS - That branch of moral science, idealism, justness, and fairness, which treats of the duties which a member of a profession or craft owes to the public, to his clients or patrons, and to his professional brethren or members.

EVICTION - Usually a process instituted to oust a person from possession of real estate.

8187

EVIDENCE - That which tends to prove or disprove any matter in question.

EX OFFICIO - By virtue of his office.

EXAMINER - A title company employee charged with the duty of interpreting and passing upon the validity of documents dealing with real property. Sometimes designated as a title officer.

EXCEPTION - In legal descriptions that portion of lands to be excluded or deleted. The term is often used in a different sense to mean an objection to title or encumbrance on title.

EXCESS RENT - The amount being paid over and above the economic rent. The difference between contract rent and economic rent.

EXCHANGE - An exchange of one property for another. A special contract for exchange should be used by the broker in bringing about this transaction.

EXCLUSIVE AGENCY LISTING - A written instrument giving one broker the right to sell property for a specified time, but reserving the right of the owner to sell the property himself without the payment of a commission.

EXECUTE - To complete, to make, to perform, to do, to follow out, to execute a deed, to make a deed, including especially the signing, sealing and delivery; to execute a contract is to perform the contract, to follow out to the end, to complete all its terms.

EXECUTED CONTRACT - All of the terms and conditions have been fulfilled.

EXECUTION - A writ issued to a sheriff or law enforcement officer requiring the execution of a judgment of the court.

EXECUTOR - A person named in a will to carry out its provisions.

EXECUTORY CONTRACT - Something remains to be done.

EXECUTRIX - A woman appointed to perform the duties of an executor.

EXEMPT - Free from burden or liability.

EXPANSIBLE HOUSE - Home designed for further expansion and additions in the future.

EXPANSION JOINT - A bituminous fiber strip used to separate units of concrete to prevent cracking due to expansion as a result of temperature changes.

FACADE - Front of a building.

FALSE PRETENSE - False representations and statements made with the design of obtaining something of value, with intent to cheat.

FALSE REPRESENTATION - An untrue representation willfully made to deceive another to his loss.

F.H.A. - Federal Housing Administration. An agency of the United States Government that insures real estate loans.

F.N.M.A. - Federal National Mortgage Association; buys and sells FHA insured and VA guaranteed mortgages; known as Fanny Mae.

FSLIC - Federal Savings and Loan Insurance Corporation; an instrumentality of the federal government which insures up to $10,000 a savings account in an institution which is a member of the Corporation.

FEE - An estate of inheritance in real property.

FEE SIMPLE - In modern usage the terms "fee" and "fee simple" are substantially synonymous.

FEE SIMPLE ABSOLUTE - An estate in real property by which the owner has the greatest power over the title possible to have under our system of law. He may dispose of it by sale, or trade, or will, as he chooses. It is the best title one can have. Complete ownership.

FEE TAIL - An estate of inheritance limited to a class of heirs.

FIDUCIARY - A person in a position of trust and confidence, as between owner and broker; broker as fiduciary owes certain loyalty which cannot be breached under rules of agency.

FINANCE - To find or to provide capital.

FINANCING STATEMENT - A document prepared for filing with the County Clerk or Secretary of State indicating that personal property or fixtures is encumbered with a debt; required by the Uniform Commercial Code; brief notice of existence of a security agreement (chattel mortgage or conditional sales contract) filed with

County Recorder where real estate mortgages are filed.

FIRE STOP - A solid, tight enclosure of a concealed space, placed to prevent the spread of fire and smoke through such space.

FIRM COMMITMENT - A commitment by the F.H.A. to insure a mortgage on specified property with a specified mortgagor.

FIRST MORTGAGE - A mortgage which has priority as a lien over all other mortgages.

FIXED CHARGES - Real Estate taxes and insurance.

FIXTURES - Tangible personal property attached to the land or improvements, which usually cannot be removed without agreement as they become real property. Examples: plumbing fixtures and store fixtures built into the property.

FLASHING - Sheet metal or other material used to protect a building from seepage of water.

FLOOR AREA - Total area of all stories or floors finished as living accommodations; does not include space in garages, carports, attics; measurements are taken to outside of exterior wall.

FLOOR PLAN - Drawing of a house, as though seen from above with roof off, showing rooms, partitions, windows, doors, stairs.

FOOTING - The base or bottom of a foundation wall, pier or column.

FORCIBLE ENTRY AND DETAINER - The name of an action for the prompt recovery of the possession of real property in certain cases.

FORECLOSURE - A legal remedy to collect a debt or lien secured by real property. Property is sold to pay the debt in event of default in payments or terms.

FORESHORE - Land between high and low water marks.

FORFEITURE - Loss of money or anything of value due to failure to perform, such as under a contract for the sale of property.

FORGERY - Falsely making or materially altering any writing with intent to defraud.

FORTHWITH - At once, immediately, promptly.

FORWARDING FEE - Charge made by lender for a letter to the title

company stating the exact amount necessary to pay off the loan on a given date. (Beneficiary statement.)

FOUNDATION - The supporting portion of a structure below the first floor construction, or below grade, including the footings.

FOUR AGENTS IN PRODUCTION - Labor, Coordination, Capital and Land.

FRAUD - The intentional and successful employment of any cunning, deception, collusion, or artifice as a means of circumventing, cheating or deceiving another person, whereby that person acts upon such means to his own loss.

FREEHOLD - A tenure of land held in "Absolute Fee Simple" or "Limited Fee Simple", as distinguished from a leasehold. In feudal society of medieval England it described an owner not subject to certain servile incidents or demands of his overlord.

FREEHOLDER - A record owner of real property or the purchaser under a duly recorded contract of purchase of real property, but does not include the vendor under a duly recorded contract of purchase of real property.

FRONT FOOT - Property measurement for sale, lease or valuation purposes. The property measures by the front foot on its street line, each front foot extending the depth of the lot.

FROST LINE - The depth of frost penetration in the soil; varies in different parts of the country; footings should be placed below this depth to prevent movement.

FUNCTIONAL DEPRECIATION - Loss of value from all causes within the property. (One bathroom for 4 bedroom home, lack of closet or storage space, bathroom off the kitchen, no rear entrance.)

FUNCTIONAL OBSOLESCENCE - Impairment of functional capacity or efficiency. It is evidenced by conditions within the property such as poor plan, inadequacy or over-adequacy due to size, style, age or otherwise.

FUNCTIONAL UTILITY - The sum of a property's attractiveness and usefulness.

FURRING - Strips of wood or metal applied to a wall or other surface to even it, to form an air space, or to give the wall an appearance of greater thickness.

GABLE ROOF - A pitched roof with sloping sides.

GAMBREL ROOF - A curb roof, having a steep lower slope with a flatter upper slope above.

GARNISHMENT - A notice to a person holding another's property (for example, a bank account) to give the court an accounting of it and not to yield it to the one who holds title to it; a notice to present oneself in court.

GENERAL WARRANTY - A covenant in a deed whereby the grantor agrees to protect the grantee against any claimant.

G.I. LOAN - Loans guaranteed by the U. S. Veterans Administration under Servicemen's Readjustment Act of 1944; only honorably discharged veterans and their widows are eligible; sometimes used to identify loans of the Oregon Department of Veterans' Affairs.

GIFT DEED - A deed for which the consideration is love and affection, and where no material consideration was involved.

GIRDER - A large beam used to support beams, joists and partitions.

GOVERNMENT LOTS - Quarter sections along north and west boundaries of townships, made irregular in shape by curvature of earth; also caused by meanderable bodies of water, government donations, reservations, and other variables existing prior to the Government Survey.

GOVERNMENT SURVEY - Rectangular system of land survey which divides a district into 24 mile square tracts from the Meridian (north-south line) and the Baseline (east-west line); and tracts are divided into 6 mile square parts called Townships, which are in turn divided into 36 tracts one mile square known as Sections.

GRADE - Ground level at the foundation.

GRADE, FINISH - Final elevation of lawns, walks, drives, etc., after backfilling has been completed.

GRADE, NATURAL - Undisturbed natural surface of the ground before construction begins.

GRADIENT - Slope, or rate of increase or decrease in elevation of surface, road or pipe; usually expressed in percentages.

GRADUATED LEASE - Either a short term or long term lease in which the flat rent or minimum rent will be stepped up or down after an initial period. Frequently rent is based upon periodic appraisals or gross income. Usually used to assist a tenant get started, but

sometimes desired by the lessor for tax reasons.

GRAND INCIDENT - Right of survivorship in tenancy by the entirety.

GRANT - A technical term made use of in deeds of conveyance of lands to indicate a transfer.

GRANTEE - A person to whom real estate is conveyed; a buyer.

GRANTOR - A person who conveys real estate by deed; a seller; the borrower in a trust deed transaction.

GRID MAP - Subdivision map drawn without reference to topography - usually straight lines without contours.

GROSS INCOME - Total income from property before any expenses are deducted.

GROSS LEASE - A lease in which the lessee pays only the stipulated rent, all other charges against the property, such as taxes and insurance, are paid by the lessor.

GROSS RENT MULTIPLIER - A factor used in a "rule of thumb" method of arriving at an indication of value. The gross rental income is multiplied by the factor. The factor is obtained by dividing known sales prices of comparable properties by the rental income of those properties.

GROUND LEASE - An agreement for the use of the land only, sometimes secured by improvements placed on the land by the user.

GROUND RENT - Earnings of improved property credited to earnings of the ground (land) itself after allowance is made for earnings of improvements; often termed "economic rent".

GUARANTEED SALE - Broker guarantees that listings will be sold within listing period or he will buy it. Frequently unenforceable.

GUARANTY - A warranty, given by a third party, for the payment of a debt or other obligation or for the performance of some act.

GUARDIAN - One appointed by the court to administer the affairs of an individual not capable of administering his own affairs.

HABEAS CORPUS - A writ or order commanding a person detaining another to produce him and submit to a decision on the legality of the detention.

HABENDUM CLAUSE - That clause in a deed in which the quantity of the estate taken in indicated and means the affirmation of the principle of the private ownership of property; known as the "To have and to hold" Clause.

HARBOR LINE - An arbitrary line set by authorities on navigable rivers beyond which wharves and other structures may not be built.

HEADER - A beam placed perpendicular to joists and to which joists are nailed in framing for chimney, stairway, or other opening.

HEIR - One who might inherit or succeed to an interest in lands under rules of law applicable where an individual dies without leaving a will.

HEIRS AND ASSIGNS - Terminology used in deeds and wills to provide that the recipient receives a "fee simple estate" in lands rather than a lesser interest.

HEREDITAMENTS - Any property which may be inherited whether real, personal, corporeal or incorporeal.

HIATUS - A gap or space unintentionally left between when attempting to describe adjacent parcels of land.

HIGHEST AND BEST USE - An appraisal phrase meaning that use which at the time of appraisal is most likely to produce the greatest net return to the land and/or buildings over a given period of time; that use which will produce the greatest amount of amenities or profit. This is the starting point of an appraisal.

HIP ROOF - A pitched roof with sloping sides and ends.

HOLDER IN DUE COURSE - One who has taken a note, check or bill of exchange in due course: (1) before it was overdue, (2) in good faith and for value, (3) without knowledge that it has been previously dishonored and without notice of any defect at the time it was negotiated to him.

HOLDOVER TENANT - Tenant who remains in possession of leased property after the expiration of the lease term.

HOLOGRAPHIC WILL - A will written by its maker (the lestator) entirely in his own handwriting.

HOME IMPROVEMENT LOANS - Non-insured, unsecured loans for property alternation, repair or improvement made by lending institutions.

HOMESTEAD - A home upon which the owner or owners have recorded a Declaration of Homestead as provided by Oregon statutes; protects home against judgments up to specified amounts.

HORIZONTAL PROPERTY REGIMES - See CONDOMINIUM.

HHFA - Housing and Home Finance Agency; a permanent federal agency started in 1947 and charged with carrying out the principal government housing and home financing aids which Congress enacts.

HUNDRED PER CENT LOCATION - The location or site in a city which is best adapted to carrying on a given type of business.

HYPOTHECATE - To give a thing as security without the necessity of giving up possession of it.

ILLEGITIMATE - That which is contrary to law.

IMPROVED VALUE - The market value of land and improvements.

IMPROVEMENTS - Those additions to raw lands tending to increase value, such as buildings, streets, sewers, etc.

INCHOATE - Recently or just begun; unfinished, something begun but not completed, such as the dower or curtesy rights of living husband and wife.

INCOME - The money return or other material benefit arising from the use of a capital good.

INCOME APPROACH - One of the three appraisal methods used in arriving at the indicated market value of real property; based on the theory that value of a property is the present worth of the net income it will produce during the remainder of its productive life.

INCOMPETENT - One who is incapable of managing his affairs because mentally deficient or undeveloped.

INCREMENT - An increase. Most frequently used to refer to the increase in the value of land that accompanies population growth and increasing wealth in the community. The term unearned increment is used in this connection since values are supposed to have increased without effort on the part of the owner.

INCUMBRANCE - Any right to or interest in property which diminishes its value in the hands of the owner, and yet does not deprive

him of the title thereto or use thereof, nor of the power to convey or transfer the same.

INCURABLE DEPRECIATION - A defect that cannot be or is not practical to cure. A defect in the "bone structure" of a building. It is measured by age-life or life expectancy.

INDEMNIFY - To secure against loss or damage; to make reimbursement to one for a loss already suffered.

INDENTURE - A written agreement made between two or more persons having different interests.

INDEPENDENT CONTRACTOR - A person self-employed, or one employed by another who has no right of control over the employee except as to final results. Although tax laws differ as to the classification of a real estate salesman, the Oregon license law contemplates that salesmen are employed by brokers who exercise reasonable supervision and are responsible for the acts of their salesmen.

INFANCY - The state of a person under the age of legal majority; minority.

INFILTRATION - Displacement by persons of a lower economic status.

INGRESS - The right to enter a tract of land. Often used interchangeably with access.

INJUNCTION - A writ or order issued under the seal of a court to restrain one or more parties to a suit or proceeding from doing an act which is deemed to be inequitable or unjust in regard to the rights of some other party or parties in the suit or proceeding.

INSTALLMENT NOTE - A note which provides that payments of a specified sum or amount be paid on dates specified in the instrument.

INSTRUMENT - A written legal document, created to effect the rights and liabilities of the parties.

INSURABLE TITLE - A title which can be insured by a title insurance company.

INTANGIBLE VALUE - Good will.

INTEREST - Money paid for the use of money; rent for the use of money;

8196

the return on an investment.

INTEREST RATE - A percentage of the amount of a loan paid for the use of the money and covering a specified period, usually one year. In the income approach to value that rate of return necessary to attract capital to the particular type of investment at the particular time.

INTERIM FINANCING - Financing used during construction to be superceded by take-out financing after construction.

INTESTATE - A person who dies having made no will, or one which is defective in form, in which case his estate descends to his heirs at law or next of kin.

INTIMIDATION - A contract procured by intimidation is void.

INVESTMENT VALUE - Long term value, always based on market value.

INVOLUNTARY LIEN - A lien imposed against property without consent of an owner. Example: taxes, special assessments, federal income taxes.

IRREVOCABLE - Incapable of being recalled or revoked; unchangeable.

IRRIGATION DISTRICT - Quasi-political district created under special laws to provide for water services to property owners in that district.

JAMB - The side post or lining of a doorway, window or other opening.

JEOPARDY - Peril; danger.

JOINT - The space between the adjacent surfaces of two components joined and held together by nails, glue, cement, or mortar.

JOINT NOTE - A note signed by two or more persons who have equal liability for payment.

JOINT TENANCY - A joint holding of property by two or more persons, who, as co-tenants, enjoy the property equally throughout their lives with right of survivorship to the other grantees. Not applicable to a husband and wife. Abolished in Oregon by ORS 93.180. All persons having an undivided interest in real property, except tenants by the entirety, are to be deemed and considered tenants in common.

JUDGMENT - Is a general lien which attaches to all the lands of the

judgment debtor when docketed; the final determination of the rights of the parties in an action, or special proceeding.

JUDGMENT CREDITOR - One who has received a decree or judgment of court for money due for any cause.

JUDGMENT DEBTOR - One against whom a judgment has been issued by a court for money owed.

JUDGMENT LIEN - The charge upon the lands of a debtor resulting from the decree of a court properly entered in the judgment docket.

JUNIOR MORTGAGE - A mortgage second in lien to a previous mortgage; having a mortgage ahead.

JURAT - That part of an affidavit in which the officer certifies that the same was sworn to before him.

JURISDICTION - The power and authority to hear and determine a cause.

JURY - A body of persons temporarily selected from the qualified inhabitants of a particular district, and invested with power (1) to present or indict a person for a public offense; or (2) to try a question of fact.

LABOR - The cost of wages.

LACHES - Delay or negligence in asserting one's legal rights.

LAND - Property of the immovable class; the residue or value into perpetuity.

LAND CLAIM - A claim to a piece of land based on conformity to the legal requirements for settlement and title.

LAND CONTRACT - Sometimes referred to as an "installment land contract". A contract ordinarily used in connection with the sale of property in cases where the seller does not wish to convey title until all or a certain part of the purchase price is paid by the buyer; usually used for long-range financing and permitting a small down payment. Frequently provides that when a stipulated amount has been paid the deed is transferred and the balance financed by a note and mortgage.

LAND GRANT - Government land granted to a railroad, educational institution, etc.

LAND PLANNING - A technique influencing the form and nature of new

subdivisions; the first step in the process of dividing land in such a way that the life of a whole community will be benefited.

LAND, TENEMENTS AND HEREDITAMENTS - A phrase used in early English law. Its present use denotes real estate with all fixed improvements thereon.

LANDMARK - A fixed object serving as a boundard mark to a tract of land.

LATH - A building material of wood, metal, gypsum, or insulating board fastened to the frame of a building to act as a plaster base.

LEASE - A written legal document in which possession of a property is given by the owner to a second party for a specified time and for a specified rent, and setting forth the conditions upon which the tenant may use and occupy the property.

LEASE - GROUND - An agreement for use of land for a specified term usually secured by the improvements placed thereon by the lessee.

LEASE INTEREST - The rights of each party in a leasehold. Under the two property concept the owner has sold one right to the lessee. The same theory holds true in the case of the sale of mineral rights.

LEASE - PERCENTAGE - A lease of property in which the rental for its use is measured by or dependent upon the business transacted by the lessee. The usual method is payment to the lessor of an agreed upon percentage of the gross receipts of the lessee.

LEASED FEE - The fee of a property subject to a lease.

LEASEHOLD - A property held under tenure of lease; a property consisting of the right of use and occupancy by virtue of a lease agreement; the lessee's (tenants) interest in a lease.

LEGACY - A gift of personal property by will.

LEGAL DESCRIPTION - The legal identification of real property by either (1) the rectangular survey, (2) metes and bounds, (3) recorded plat, which a court will compel one to give or accept.

LEGAL RATE OF INTEREST - The rate of interest that may be charged

is governed by state law. The legal rate is the rate charged in the absence of an express contract between the parties. The contract rate is the highest rate upon which the parties may agree. In Oregon the legal rate is 6% and the contract rate is 10%.

LEGATEE - A person who takes personal property under a will.

LESSEE - One who possesses the right to possession and use of a property under a written or oral agreement.

LESSEE'S INTEREST - The right to use plus the right to receive any excess rent during the life of the lease.

LESSOR - A title holder who grants the right to use and occupy a property under a written or oral agreement.

LESSOR'S INTEREST - The right to receive rent and the right to the reversion (right to get the property back).

LIABILITY - The condition of being bound in law and justice to do something which may be enforced in the courts.

LICENSE - A privilege or right granted by the state to an individual to operate as a real estate broker or salesman.

LICENSEE - One who has a license to perform a specified task or business; one who holds a real estate license.

LIEN - A special encumbrance; a charge against property whereby the property is made security for the payment of a debt or charges such as a judgment, a mortgage or taxes; a lien is an asset and therefore may be assigned.

LIEN - FIRST PARAMOUNT - Having priority over any other lien.

LIEN - JUNIOR - One that is secondary to the lien recorded ahead of it.

LIFE ESTATE - A (freehold) interest in land, the duration of which is confined to the life of one or more persons or contingent upon certain happenings.

LINK - A term of land measurement being 1/100th of a chain of 66/100th of a foot.

LINTEL - A horizontal board that supports the load over an opening such as a door or window.

8200

LIS PENDENS - Suit pending. Usually recorded so as to give constructive notice of pending litigation.

LISTING - A written employment contract between principal and agent authorizing agent to perform services for the principal involving the latter's property; a record of property for sale by a broker who has been authorized by the owner to sell; the property so listed.

LITIGATION - The act of carrying on a lawsuit.

LITTORAL - That which belongs to the shore of a sea or large lake. A coastal region.

LOAN AGREEMENT - A written document issued in connection with a particular loan which sets forth the terms upon which the loan will be made; does not include a mortgage or trust deed which secures a promissory note.

LOAN CLOSING - All of the actions and procedures incident to the establishment of a valid prior lien on the subject property; legal consummation of the mortgage loan transaction.

LOAN FEE - A charge made by a lender when granting a loan; usually considered the amount necessary to process and complete the documents.

LOCK-IN - Mortgage or trust deed without provision for prepayment with or without interest. May require full interest payment to maturity to refinance.

L.S. - The abbreviation for the Latin phrase "locur sigilli"; the place occupied by the seal on a written instrument, as the seal of a public officer, such as a notary. Private persons seldom use a seal today, though legal documents often provide a place for one.

LOT BOOK REPORT - A non-liability letter issued by title companies showing the last owner of record and encumbrances thereafter; not a title report.

LOT LINE - Line bounding lot as described in the title to the property.

LOTTERIES - Schemes for distributing prized by chance.

LOUVER - An opening with a series of horizontal slats set at an angle to permit ventilation without admitting rain, sunlight, or vision.

M.A.I. - Designates a person who is a member of the American Institute of Real Estate Appraisers of the National Association of Real Estate Boards.

MAIN OFFICE - The place of business of a licensed real estate broker. The place of business of the broker is designated in his license, and must be identified by a sign containing the name under which he conducts his business; the words "Real Estate", or "Realtor" if a member of the National Association of Real Estate Boards; and in which he must display his license and the licenses of all salesmen employed by him.

MAJORITY - In Oregon an individual reaches majority at the age of 21 years. All persons are deemed to have arrived at majority upon their being married according to law. See MINOR.

MANDATORY - Requiring strict conformity or obedience.

MARGINAL LAND - That land which barely pays the cost of working or using; land whereon the costs of operating approximately equal the gross income.

MARKET DATE APPROACH - One of three appraisal methods used in valuation. An estimate of value of a property is obtained by comparing it with similar properties in the same type and class which have been sold recently or are currently offered for sale in the same or competing areas.

MARKET PRICE - The price paid for a property; the amount of money that must be given or which can be obtained at the market in exchange under the immediate conditions existing at a certain date. To be distinguished from "Market Value".

MARKET VALUE - The highest price which a buyer, willing but not compelled to buy, would pay, and the lowest price a seller, willing but not compelled to sell, would accept; F.H.A. - The price which typical buyers would be warranted in paying for the property for long time use or investment if they were well informed, acted voluntarily and without necessity; M.A.I. - As defined by the courts, is the highest price estimated in terms of money which a property will bring if exposed for sale in the open market allowing a reasonable time to find a purchaser who buys with knowledge of all the uses to which it is adapted and of which it is capable of being used.

MARKETABLE TITLE - Merchantable title, clear title and good title are synonymous, and mean that the land is free from encumbrances or is title that a court would compel a purchaser to accept.

1093 8202

MATERIAL FACT - A fact is material if it is one which the agent should realize would be likely to affect the judgment of the principal in giving his consent to the agent to enter into the particular transaction on the specified terms.

MECHANIC'S LIEN - A lien created by state law in favor of persons who have performed work or furnished materials in the erection or repair of a building.

MEETING OF MINDS - A mutual intention of two persons to enter into a contract affecting their legal status and based on agreed upon terms; a complete understanding between the interested parties.

MEGALOPOLIS - A very large city; an area containing a series of cities.

MERCHANTABLE - Salable in the ordinary way; fit for the ordinary uses to which it is put.

METES AND BOUNDS DESCRIPTION - A legal description of a parcel of real estate that describes the boundaries by direction and measurement from a designated starting point called a monument; METES are measure of length such as inches, feet, years or rods; BOUNDS are boundaries, both natural and artificial, such as streams, streets or roads.

MILL - One-tenth of one cent; the measure used to state the property tax rate; a tax rate of one mill on the dollar is the same as a rate of one-tenth of one percent of the assessed value of the property.

MINOR - All persons under 21 years of age, except that any person lawfully married who is 18 years or over is deemed an adult person for the purpose of entering into any engagement or transaction respecting real property.

MINOR LIENS - Criminal surety bonds, property taxes and federal taxes; (a surety bond is a pledge of property in lieu of bail money for a person accused of a crime).

MODERNIZATION - The replacement in modern style of outmoded parts of the structure and/or equipment.

MODIFICATION AGREEMENT - Extension of the term of a conventional loan in arrears.

MOLDING - Usually patterned strips used to provide ornamental variation of outline or contour, such as cornices, bases, window and door jambs.

MONUMENT - A fixed object and point established by surveyors to establish land locations.

MORAL TURPITUDE - Want of integrity; lack of honesty and uprightness.

MORATORIUM - The temporary suspension, usually by statute, of the enforcement of liability for debt.

MORE OR LESS - These words, when used in a conveyance of land, after a statement of the number of acres therein, are intended to cover only a reasonable excess or deficit.

MORTGAGE - A written instrument recognized by law by which real property is pledged to secure a debt or obligation; a lien on real property.

MORTGAGE CLIPPING - Acquisition of distressed property for income to be derived without payment to mortgagee.

MORTGAGE CORRESPONDENT - One who represents a lender of money on the security of real property; one who represents a potential mortgagee.

MORTGAGE GUARANTY INSURANCE - Insurance against financial loss available to mortgage lenders from Mortgage Guaranty Insurance Corporation, a private company organized in 1956.

MORTGAGE MILKING - See MORTGAGE CLIPPING.

MORTGAGEE - The party who advances the capital for a mortgage loan and in whose favor the property serving as security is mortgaged.

MORTGAGOR - The party who borrows money or mortgage security and mortgages property owned by him as security for a loan.

MULTIPLE LISTING - A listing, usually an exclusive right to sell, taken by a member of an organization composed of real estate brokers, with the provision that all members will have the opportunity to find a purchaser; a cooperative listing with a prearranged division of commission between the listing broker and the selling broker, with a small percentage going to the board or exchange.

NAREB - Abbreviation for National Association of Real Estate Boards.

NATIONAL HOUSING ACT - A series of related laws called "Titles", each of which covers a different part of the government's mortgage insurance program.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

NEGATIVE LEASEHOLD - Where the contract rent exceeds the economic rent.

NEGOTIABLE - Capable of being negotiated; assignable or transferrable in the ordinary course of business.

NEGOTIABLE INSTRUMENT - A written promise or order to pay money - promissory note is first; bank check second.

NEIGHBORHOOD - An area in which people of relatively similar habits and tastes carry on their living or business activity. Property is an integral part of a neighborhood.

NET INCOME - Income from property or business after expenses have been deducted; effective gross income less operating expenses.

NET LEASE - A lease where, in addition to the rent stipulated, the lessee assumes payment of all property charges such as taxes, insurance and maintenance.

NET LISTING - A price, which must be expressly agreed upon, below which the owner will not sell the property and at which price the broker will not receive a commission; the broker receives the excess over and above the net listing as his commission.

NON-CONFORMING USE - Use made of property before zoning which does not conform to the zone uses; it is usually permitted to continue under certain stipulation.

NONCUPATIVE WILL - An oral will or a will made by a word-of-mouth declaration.

NON-RESIDENT - Persons who do not reside within the state.

NOTARY PUBLIC - A public officer, appointed by the Governor, who attests or certifies deeds and other instruments to make the execution authentic.

NOTE - A written instrument which acknowledges the debt and promises to pay.

NOTICE TO QUIT - Notice to a tenant to vacate rented property.

OAREB - Abbreviation for Oregon Association of Real Estate Boards.

OBJECTIVE VALUE - Created in the object itself. Found in the cost approach to appraising where emphasis is placed on the cost of production, plus the land.

OBSOLESCENCE - As applied to real estate it is a loss in value due to structural, economic or social change. Its effect is depreciation.

OCEAN SHORE - That part of the Pacific Ocean between ordinary high tide and extreme low tide, and from the state's borders with Washington on the north and California on the south; owned by the state and declared a recreation area.

OFFICE IN HAT - See CURB RIDER.

OFFSET STATEMENT - Statement by owner of property or owner of lien against the property setting forth the present status of liens against the property.

OPEN END CLAUSE - A clause in a mortgage to provide a method of advancing the note after partial payment. To meet new obligations the debt can be quickly restored to its original amount.

OPEN LISTING - A listing which is non-exclusive; may be given to any number of brokers without liability to compensate any except the one who first secures a buyer ready, willing and able to meet the terms of the listing, or secures acceptance by the seller of a satisfactory offer. Quite generally held to be the source of many misunderstandings.

OPINION - An exercise of experience and judgment.

OPTION - A written agreement granting the exclusive right, during a stated period of time, without creating an obligation on the grantee, to buy, or control the use of property.

ORAL CONTRACT - A verbal agreement which is not reduced to writing.

ORDER - Any intermediate determination, as distinguished from a judgment or decree.

OREGON REAL ESTATE BOARD - A statutory body consisting of the real estate commissioner and four members appointed by the Director, Department of Commerce, charged with responsibility for the examining of applicants for a license, making and enforcing rules and regulations; advise on matters to best serve the state and the licensees, and in the conduct of an educational program.

ORGANIC LAW - The Constitution of the United States and the Constitution of the State of Oregon.

8206

ORIENTATION - Placing a house on its lot with regard to its exposure to the rays of the sun, prevailing winds, privacy from the street and protection from outside noises.

OVER IMPROVEMENT - An improvement which is not the highest and best use for the site on which it is placed by reason of excess in size or cost.

OVERALL INTEREST RATE - The rate that includes interest on the land, interest on the building, and a recapture of capital.

OVERHANG - The part of the roof extending beyond the walls to shade buildings and cover walks.

PACKAGE MORTGAGE - Popular form of mortgage used with new residential sales. The debt includes the cost of certain mechanical or electrical equipment. Equal monthly payments take care of interest, principal, taxes, fire insurance and equipment.

PAR VALUE - Market value, nominal value.

PARCEL MAP - Final map pertaining to lot splits not constituting subdivision per Map Act.

PARKING RATIO - The ratio of square foot of parking area to gross area of the building served by the parking area.

PAROL EVIDENCE RULE - Provides that the courts will prohibit introduction of any oral testimony in a court proceeding which may be necessary to establish the meaning of a real estate contract.

PARQUET FLOOR - Hardwood flooring laid in squares or patterns.

PARTIAL RELEASE CLAUSE - See RELEASE CLAUSE.

PARTITION - A division made of real property between those who own it in undivided shares.

PARTNERSHIP - A contract of two or more persons to unite their property, labor or skill, or some of them, in prosecution of some joint and lawful business, and to share the profits in certain proportions.

PARTY WALL - A wall common to buildings on two adjoining properties.

PATENT - Conveyance of title to government land.

PAWN - Goods entrusted to a creditor as security for a loan, a pledge

8207

or a hypothecation.

PENNY - The term, as applied to nails, serves as a measure of nail length and is abbreviated by the letter "d".

PER CAPITA - By heads, that is, by individuals. Persons taking equal shares, each in his own right, in the distribution of a decedent's estate; in contradistinction to a share for an entire class which is termed "per stirpes".

PER STIRPES - Taking property by right of representation is called "succession per stirpes", in opposition to taking in one's own right or as a principal, which is termed "per capita"; distribution of shares by classes of kindred relations.

PERCENTAGE LEASE - A lease of property in which the rental is an amount equivalent to a stated portion of the receipts from the business conducted by the lessee; frequently expressed as a percentage of the gross revenues.

PERCOLATION TEST - A test to determine the capacity of a soil to absorb water.

PERIMETER HEATING - Baseboard heating, or any system in which the heat registers are located along the outside wals of a room, especially under the window.

PERSONAL LIABILITY - Responsibility of one who is bound in law and justice to do something which may be legally enforced.

PERSONAL PROPERTY - Any property which is not real property. In event of question three tests are applied. They are: (1) real or constructive annexation of the article to the realty, (2) adaptation of the article to the use or purpose of that part of the realty with which it is connected, (3) intention of the party making the annexation to make the article a permanent part of the real property.

PERSONALTY - Used broadly means personal property; everything not real property.

PHYSICAL DEPRECIATION - The loss of value from all causes of age and action of the elements. Example: broken window, hole in plaster, collapsed porch railing.

PIER - A column of masonry, usually rectangular in horizontal cross section, used to support other structural members.

8208

PITCH - The incline or rise of a roof.

PLAT - A plan or map of a certain piece or pieces of land.

PLAT BOOK - A public record of various recorded plans in a stated area.

PLATE - A horizontal board placed on a wall or supported on posts or studs to carry the trusses of a roof or rafters directly; a shoe, or base member as of a partition or other frame; a small board on or in a wall to support girders, rafters, etc.

PLEDGE - The depositing of personal property by a debtor with a creditor as security for a debt or engagement.

PLOT - Parcel of land consisting of one or more lots or portions thereof; usually described by reference to a recorded plat.

PLOTTAGE INCREMENT - The appreciation in unit value created by joining smaller ownerships into one large single ownership.

POCKET LICENSE CARD - Evidence of possession of real estate license issued to each broker and salesman by the Real Estate Division; to be carried at all times, and presented when requested by any person with whom the licensee is dealing in regard to real estate.

POINTS - Loan fee exacted by lender from seller at time loan is made. Sometimes paid by buyer.

POLICE POWER - The right of the state, county or city as a constitutional authority to enact laws and enforce them for the order, safety, health, morals and general welfare of the public.

POSITIVE LEASEHOLD - Where the contract rent is lower than the economic rent.

POWER OF ATTORNEY - An instrument authorizing a person to act as the agent of the person granting it. A general power authorizes the agent to act generally in behalf of his principal; a special power limits the agent to a specific or particular act.

PREPAYMENT CLAUSE - A clause in a mortgage permitting partial or full payment prior to due date. Many of these clauses contain a provision that a penalty must be paid if the benefit of the clause is exercised.

PREPAYMENT YIELD - Percent return on obligation paid prior to maturity.

PRESCRIPTION - The securing of title to property by adverse possession; by occupying it for the period determined by law barring action for recovery.

PRESENT VALUE - Value at the present of an amount to be recorded in the future.

PRESENT VALUE OF AN ANNUITY - Value at present of receiving a set of equal payments in the future.

PRICE - The amount asked or the amount paid.

PRICE KITING - See DUAL CONTRACTS.

PRIMA FACIE - Presumptive on its face.

PRINCIPAL - The employer of an agent; the person ordinarily liable primarily; the amount of a debt.

PRINCIPAL NOTE - The promissory note which is secured by the mortgage or trust deed.

PRIORITY - Legal preference.

PRIVITY - Mutual relationship to the same rights of property; contractual relationship.

PROBATE COURT - A court having jurisdiction of the proof of wills, the settlement of estates, and, usually, of guardianships. In this state it is in the Circuit Court.

PROPER INTEREST RATE - The rate that will attract capital.

PROPERTY - The right or interest which an individual has in lands and chattels to the exclusion of all others; the rights we gain from the ownership of wealth.

PROPERTY LINE - Recorded boundary of a plot.

PRO-RATE - To allocate between seller and buyer their proportionate share of an obligation paid or due; for example, a pro-rate of real property taxes or insurance.

PRORATION OF TAXES - To divide or pro-rate the taxes equally or proportionately to the time of use of the property.

8210 [illegible]

PROSPECTUS - A printed folder describing a specific property.

PROXIMATE CAUSE - The proximate cause of an event is that which, in a natural and continuous sequence, unbroken by any new cause, produced that event, and without which that event would not have happened.

PUBLIC POLICY - The law considers the conservation and promotion of the public welfare to be the first and highest duty of government, and it will not countenance any transaction which contravenes a sound public policy.

PUNITIVE DAMAGES - Damages by way of punishment.

PURCHASE MONEY MORTGAGE - A mortgage given by the buyer to the seller as part or all of the purchase price of property. In the event of foreclosure of such a mortgage the mortgagee is not entitled to a deficiency judgment.

QUALITIES OF VALUE - Utility, scarcity, desire, ability to buy.

QUARTER ROUND - A molding that presents a profile of a quarter circle.

QUIET ENJOYMENT - The right of an owner to the use of property without interference of possession.

QUIET TITLE - A court action brought to establish title; to remove a cloud on a title.

QUITCLAIM DEED - Deed given when the grantee already has, or claims, complete or partial title to the premises and grantor has a possible interest that otherwise would constitute a cloud upon the title. (not used for conveyance purposes)

RADIANT HEATING - A method of heating, usually consisting of coils or pipes placed in the floor, wall or ceiling.

RAFTER - One of a series of boards of a roof designed to support roof loads; the rafters of a flat roof are sometimes called "roof joists".

RANGE - A strip of land six miles wide determined by government survey, running in a north-south direction.

RANGE LINES - Lines parallel to the Meridian marking off the land into 6 mile strips known as ranges; they are numbered east or west of the Willamette Meridian.

RATE - A fixed relationship between two magnitudes (two items).

REAL ESTATE - Land, tenements and other hereditaments or rights therein, and whatever is made part of or is attached to it by nature or man; the land and all the improvements thereon.

REAL ESTATE BOARD - An organization whose members consist primarily of real estate brokers and salesmen in a particular political subdivision. (Not to be confused with Oregon Real Estate Board, created by statute, whose members are appointed by the Director, Department of Commerce.)

REAL ESTATE COMMISSIONER - The chief administrative officer of the Real Estate Division and chairman of the Oregon Real Estate Board. Appointed by the Director, Department of Commerce.

REAL PROPERTY - The rights to use of real estate; also used interchangeably with real estate; the three classes of estates are fee simple, for life, for years, the land and everything attached to it by man or nature.

REALTOR - A professional in real estate who subscribes to a strict Code of Ethics as a member of the local and state boards and of the National Association of Real Estate Boards.

REALTY - A collective term used to designate real estate; lands and buildings.

RECAPTURE RATE - The rate of interest necessary to provide for the return of an investment. Not to be confused with interest rate, which is the rate of interest on an investment.

RECEIVER CLAUSE - In a mortgage, to prevent dissipation of the asset that secures the loan. Receiver takes over a residential property abandoned by the mortgagor, rents and maintains it. If a business, prevent mortgagor from destroying good will, or retaining profits from the property.

RECONVEYANCE - The transfer of the title of land from one person to the immediate preceding owner. Used in Oregon with the trust deed.

RECORDING - Act of entering in a book of public record to give notice to the world. The grantee pays the fee for recording a deed; examination of public records determines a party's interest in land. Failure to record a deed will operate to divest a grantee of his title as against a subsequent purchaser from the grantor.

REDEEM - Literally "to buy back"; the act of buying back lands after a mortgage foreclosure, tax foreclosure, or other execution sale.

REDEMPTION - The right of a mortgagor to redeem the property by paying the debt after the expiration date; the right of an owner to reclaim his property after a sale for taxes; buying back one's property after a judicial sale.

REDUCTION CERTIFICATE - An instrument signed by the mortgagee stating the balance due on the mortgage, thus advising a purchaser of the true extent of the obligations on the property.

REFORMATION - An action to correct a mistake in a deed or other document.

REGRESSION - An appraisal principle that maintains the worth of better properties will be adversely affected by the presence of lessor. Evil destroys good, but good rarely lifts evil.

REHABILITATION - Restoration to satisfactory condition without changing plan, form or style. Its cost would be the cost of curable deterioration and obsolescence.

RELEASE - The relinquishment of some right or benefit to a person who already has some interest in the property.

RELEASE CLAUSE - A stipulation that upon the payment of a specific sum of money to the holder of a trust deed or mortgage that the lien of the instrument as to a specifically described lot or area shall be removed from the blanket lien on the whole area involved.

RELEASE OF LIEN - The discharge of a certain property from the lien of a judgment, mortgage or claim.

RELICTION - Gradual subsidence of waters leaving dry land.

REMAINDER - An estate which vests after the termination of the prior estate, such as a life estate.

REMISE - To remit or give up.

REMODELING - Changing the plan, form or shape to correct functional or economic deficiencies.

RENOVATION - A combination of two or more of "rehabilitation", "modernization", and "remodeling".

RENT - The compensation paid for the use of real estate.

REPAYMENT CLAUSE - A provision that the mortgagor may pay the entire or stated amounts on the principal at any time he chooses prior to the due date.

REPLACEMENT COST - The cost of erecting a building to take the place of or serve the functions of a previous structure.

REPRESENTATION - The principle by which the descendants of a deceased person inherit the share of an estate which the deceased person would have inherited if he had lived; the taking or inheritance per stirpes.

REPRODUCE - A replica.

REPRODUCTION COST - The cost of reproducing a new replica on the basis of current prices with the same or closely similar materials. Normal cost of exact duplication of a property as of a certain date.

RESCISSION OF CONTRACT - The abrogation or annulling of a contract by the mutual consent of the parties, or for cause by either party to the contract.

RESERVATION - A right retained by a grantor out of that property which he has conveyed.

RESERVE FUND - In multi-family properties an amount set aside from income to replace short-lived items, such as furniture and equipment; the distinctive feature of a budget mortgage loan on residential property, the monthly payments contain sufficient sums, which are impounded or reserved, to pay taxes and insurance when due.

RESIDENCE - Personal presence in a place with no present intention of removing therefrom.

RESIDUAL - That which remains; an appraisal technique to estimate the amount of net annual income attributed to the land, the building, or both; what is left after deduction; the rest of the income.

RESTRICTION COVENANT - A clause in a deed limiting the use of the property conveyed for a certain period of time, or a device in a deed for controlling the use of the land for the benefit of the land.

8214

REVERSION - The right of a lessor to recover possession of leased property upon the termination of the lease with all the subsequent right to use and enjoyment of the property.

REVERSIONARY INTEREST - The interest which a person has in lands or other property upon the termination of the preceding estate.

REVOCATION - Recall or cancellation of an authority previously vested; voiding of a written document.

RIDGE - The horizontal line at the junction of the top edges of two sloping roof surfaces; the rafters at both slopes are nailed at the ridge.

RIDGE BOARD - The board placed on edge at the ridge of the roof to support the upper ends of the rafters; also called roof tree, ridge piece, ridge plate and ridgepole.

RIGHT OF REDEMPTION - The right to free property from a claim or lien by payment of what is due with interest, costs, etc.

RIGHT OF SURVIVORSHIP - Right to acquire the interest of a deceased joint owner; the distinguishing feature of tenancy by the entireties.

RIGHT OF WAY - An easement over another's land.

RIGHTS OF OWNERSHIP - Ownership of real estate carries with it the right to possession, enjoyment, control and disposition.

RIPARIAN RIGHTS - The rights of a landowner to water on, under or adjacent to his land. These rights vary and depend upon local legal regulations.

RISK RATE - A penalty for risk.

RULES OF THUMB - Sometimes used to assist in the estimating of value of a property. Some are gross rent multiplier, price per front foot, price per square foot, cost per apartment unit, cost per room.

RUNNING WITH THE LAND - Affecting the land and the successive owners thereof; usually spoken of as a covenant or an easement.

S.R.A. - Designates a person who is a Senior Residential Appraiser member of the Society of Real Estate Appraisers.

SAFE RATE - Interest rate on government bonds, utility bonds, bank savings.

8215

SALES CONTRACT - A contract by which a buyer and seller agree to terms of a sale.

SALESMAN - Any person who, for compensation or the expectation or promise thereof, is employed or becomes associated with a licensed real estate broker to deal in real estate or do any of the acts enumerated in the Oregon law defining real estate broker. Such a person is required to be licensed as a real estate salesman; the individual who makes the wheels of the American economy go round and round.

SALVAGE VALUE - Value of the whole as it is right now.

SANDWICH LEASE - A leasehold interest which lies between the primary lease and the operating lease.

SASH - Wood or metal frames containing one or more window panes.

SATISFACTION OF A MORTGAGE - A written instrument which describes the mortgage and states that the debt has been paid, and the mortgage has been satisfied. If mortgagee fails to do this within 30 days after requested he is liable to mortgagor for $100 damages, plus actual damages occasioned by such failure.

SATISFACTION PIECE - An instrument of writing whereby satisfaction of a lien is acknowledged.

SCENIC EASEMENT - A "servitude" devised to permit land to remain in private ownership while at the same time being subject to control over its future uses to insure preservation of scenic beauty.

SCRIBING - Fitting woodwork to an irregular surface.

SEAL - A particular sign made to attest in the most formal manner the execution of an instrument. The seal affixed to a writing is primary evidence of a consideration.

SECOND MORTGAGE - The second lien on property.

SECRET INTEREST - Hidden or concealed from public knowledge.

SECTION - A section of land established by government survey and containing 640 acres.

SECURITY AGREEMENT - Document used to mortgage articles of personal property under Uniform Commercial Code; replaces chattel mortgage and conditional sales contract; in a chattel mortgage

8210

ownership of the article is transferred to the buyer; under a conditional sales contract ownership of the article remains with the seller. There is no difference under the Code.

SEPARATE PROPERTY - Property acquired by either spouse prior to marriage or by gift or devise after marriage. Property owned by a single person.

SERVICING CONTRACT - A document which enumerates specific servicing requirements and legally binds the servicing institution to perform them.

SETBACK - The distance from the curb, street or other established line within which no building may be erected.

SEVERALTY OWNERSHIP - Owned by one person only; sole ownership.

SHAKE - A hand-split shingle, usually edge grained.

SHEATHING - Structural covering, usually boards, plywood or wallboard, placed over exterior studding or rafters of a house.

SHERIFF'S CERTIFICATE - Document given purchaser at sheriff's sale under foreclosure of a mortgage.

SHERIFF'S SALE - A sale of real or personal property made by a sheriff or other like ministerial officer, in obedience to an execution or other similar mandate of the court.

SIEZEN - also SEISEN - The possession of real property by a person entitled to possess it; possession of a freehold estate in land by one having title thereto; seised of the freehold; a medieval term describing the method by which ceremonial conveyance of land was made; the actual physical moving onto the land.

SILL - The lowest part of the frame of a house resting on the foundation and supporting the uprights of the frame; the board or metal forming the lower side of an opening, as a door sill, window sill, etc.

SIMPLE INTEREST - Interest computed on the original principal.

SINKING FUND - Fund set aside from the income of property which, with accrued interest, will eventually pay for replacement of the improvements.

SKIP PAYMENT - A privilege provided in the savings and loan mortgage

8217

plan which allows the borrower to skip a monthly payment when necessary if his payment total is running ahead of contract schedule.

SKYLEASE - A lease for a long period of time of space above a piece of real estate; upper stories of a building to be erected by the tenant; upon the termination of the lease the improvements belong to the lessor.

SLANDER - The malicious speaking of false and defamatory words concerning another, whereby he is injured.

SLANDER OF TITLE - Words spoken, written or printed and published, tending to deny or diminish one's title in property.

SOIL PIPE - Pipe carrying waste out from the house to the main sewer line.

SOLE or SOLE PLATE - A member, usually 2 x 4, on which wall and partition studs rest.

SPAN - The distance between structural supports, such as walls, columns, piers, beams, girders, and trusses.

SPECIAL ASSESSMENT - Legal charge against real estate by a public authority to pay cost of public improvements such as: street lights, sidewalks, street improvements, etc.

SPECIAL PURPOSE PROPERTIES - Built for a special or single purpose and therefore have a limited demand in the market.

SPECIAL WARRANTY DEED - A deed in which the grantor limits his liability to the grantee to anyone claiming by, from, through, or under him - the grantor.

SPECIFIC PERFORMANCE - A legal action in which the court is asked to direct either the buyer or seller, whichever the case may be, to perform the terms of the contract when he has refused to fulfill his obligations; an order of the court to do specifically what was promised on a contract.

SPLIT RATE - A different rate of interest on land and buildings.

STANDARD METROPOLITAN AREA - Defined by the Bureau of the Census as a county, or a group of contiguous counties, containing a city of 50,000 population of more.

STATE VET'S LOAN - A loan at 4 percent interest to eligible war

veterans upon security of real property located in Oregon, for the acquisition of homes and farms. The program is administered by the State Department of Veteran's Affairs.

STATUS - Legal standing, condition or relation. Relative position or rank.

STATUTE - A law established by an Act of the legislature.

STATUTE OF FRAUDS - State law which provides that certain contracts must be in writing in order to be enforceable at law. Examples: real property lease for more than one year, broker's authorization to sell real estate.

STATUTE OF LIMITATIONS - A certain statutory period after which a claimant is barred from enforcing his claim by suit.

STIPULATION - A material provision in an agreement.

STRAIGHT LINE DEPRECIATION - The setting aside of equal annual amounts to recover or recapture within a period of years the present value of a building or improvement; most accurately referred to as "recapture". Example: depreciating a property 2 percent per year.

STRING, STRINGER - A timber or other support for cross members; in stairs the support on which the stair treads rest.

STUDS OR STUDDING - Vertical supporting timbers in the walls and partitions.

SUBDIVISION - Generally a tract of land divided into lots suitable for home building purposes; under Oregon law the dividing up or partitioning into four or more units of less than 5 acres each any tract or registered plot of land that was shown on the last tax roll as one unit or contiguous units, for the purpose of transferring the ownership of the land or for the improvement by building at the present or at a future time.

SUBJECT TO MORTGAGE - When a grantee takes title to real property subject to mortgage he is not responsible to the holder of the promissory note for the payment of any portion of the amount due. The most he can lose in the event of foreclosure is his equity in the property. See also "Assumption of Mortgage" in this section. In neither case is the original maker of the note released from his responsibility.

SUBJECTIVE VALUE - Created in the mind of men. It is what people will

pay regardless of cost. In appraising it is found in the income and market data approaches.

SUBLEASE - An agreement conveying the right to use and occupancy of a property in which the lessor is the lessee in a prior lease.

SUBMERGED LANDS - Those lands which lie below the line of ordinary low water of the navigable water of this state whether such waters be tidal or nontidal.

SUBMERSIBLE LANDS - Those lands which lie between the line of ordinary high water and the line of ordinary low water of the navigable waters of this state whether such waters be tidal or nontidal.

SUBORDINATION - The act of making an encumbrance secondary or junior to another lien.

SUBORDINATION CLAUSE - A clause in a second or junior lien permitting retention or priority for prior liens.

SUBPOENA - A writ commanding the designated person to attend court under penalty for failure.

SUBPOENA DUCE TECUM - A subpoena requiring a witness to bring with him certain books or documents in his possession.

SUBROGATION - The substitution of another person in place of the creditor, to whose rights he succeeds in relation to the debt. The doctrine is used very often where one person agrees to stand by another person.

SUBSTITUTION - One of the basic economic principles of valuation. Affirms that no sensible purchaser will pay more for a property than the cost of acquiring an equally desirable substitute property providing the substitute property can be obtained without undue delay. The value of the substitute property tends to indicate the value of the subject property.

SUMMATION - An appraisal method of selecting an interest rate; an indicated value arrived at by estimating the reproduction cost, subtracting depreciation, and adding the value of the land. One method of the cost approach.

SUPPLEMENTARY PROCEEDING - A method used to determine whether a judgment debtor has any assets which can be seized by the judgment creditor for payment of the debt.

ISS 8220

SUPPLY AND DEMAND - An important principle in economics and appraising which affirms the doctrine or scarcity, desire and purchasing power.

SURETY - One who guarantees the performance of another, a guarantor.

SURPLUS PRODUCTIVITY - An appraisal theory defined as the net income remaining after the costs of labor, coordination and capital have been paid. This tends to fix the value of the land.

SURVEY - The process by which a parcel of land is measured and its area is ascertained.

SURVIVORSHIP TENANCY - A method of drafting a deed to provide for survivorship rights, other than by tenancy by the entirety.

SWAMP LANDS - Lands claimed by the state under an act of Congress approved in 1860. Generally, too wet and unfit for cultivation. Statutory provision exists for the draining of such lands.

SWEAT EQUITY - Owner-built construction lending.

TAX - A charge, usually pecuniary, laid upon persons or property for public purposes. The Constitution of the State of Oregon requires that taxes be uniform as applied to any class of property.

TAX DEED - A deed given by the tax collector to the county and terminates all rights of redemption.

TAX ROLL - A record of all taxable property with amount of tax at the millage rate applicable as of the compilation date of closing for any tax year.

TAX SALE - Sale of property after a period of nonpayment of taxes.

TAX SALE CERTIFICATE - A certificate given to one who purchases land at a tax sale.

TAX TITLE - The title by which one holds lands purchased at a tax sale.

TAXATION - A means of raising revenue by assessments on property for federal, state and municipal purposes, and one of the four constitutional limitations on property. They are eminent domain, escheat, police power and ad valorem taxes.

TENANCY AT WILL - A license to use or occupy lands and tenements at the will of the owner.

8221

TENANCY BY THE ENTIRETY - Is an estate which exists only between husband and wife, with equal rights of possession and enjoyment during their joint lives, and with the right of survivorship.

TENANCY IN COMMON - Ownership by two or more persons who hold undivided interest without right of survivorship; interests need not be equal.

TENANCY OF SUFFERANCE - A tenancy which arises when a tenant holds over after expiration of his lease.

TENANT - One who holds or possesses real estate by any kind of title, either in fee, for life, for years or at will. In a more limited and popular sense, a tenant is one who has the temporary use of real estate which belongs to another.

TENEMENTS - Everything of a permanent nature; anything attached to the soil.

TENTATIVE MAP - The map which must accompany the original written application to a planning commission or governing body for permission to launch a subdivision.

TENURE IN LAND - The mode or manner by which a man holds an estate in lands.

TERMITE SHIELD - A shield, usually of noncorrodible metal, placed on top of the foundation wall or around pipes to prevent passage of termites.

TERMITES - Ant-like insects which destroy lumber used in buildings.

TERMS - Conditions and arrangements (on a mortgage or contract for example).

TESTAMENT - Another term for a will; commonly referred to as "last will and testament".

TESTATOR - A man who makes a will.

TESTATRIX - A woman who makes a will.

3 x 3's - Dividing acreage into three parcels, and transferees re-dividing each parcel into three parcels, to avoid application of the subdivision law.

THRESHOLD - A strip of wood or metal beveled on each edge and used above the finished floor under outside doors.

ISSB 8222

TIDE AND OVERFLOW LANDS - All lands over which the tide ebbs and flows from the line of ordinary high tide to the line of mean low tide, all islands, shore lands and other such lands held by the state by virtue of her sovereignty.

TIME IS THE ESSENCE - One of the essential requirements to forming a building contract; contemplates a punctual performance when used in any contract.

TITLE - Evidence of ownership which refers to the quality of the estate; the right, interest or estate in real property.

TITLE, DEEDS - The successive deeds upon which title rests. The owner of the land is properly entitled to these. They go with the land.

TITLE INSURANCE - An insurance policy of indemnification protecting the title holder against flaws and defects in title insofar as these have been revealed by the public record and subject to certain printed exceptions.

TITLE REPORT - A report which discloses condition of the title, made by a licensed title insurance company preliminary to issuance of title insurance.

TOPOGRAPHY - Nature of the surface of the land; topography may be level, rolling, mountainous.

TORRENS CERTIFICATE OF TITLE - The evidence of ownership given a landowner by the State of Oregon; a system of land records provided by state law, a certificate is issued by the circuit court and entered in the register of titles by the county recorder.

TORRENS LAW - A state law made necessary by the time and cost of searching titles. Enabled a party to ask for a court decree that confirmed his title to land free and clear of all outstanding claims. Generally supplanted by faster, cheaper title insurance policy.

TORRENS PROPERTY - Real property to which a certificate of title has been issued by the circuit court under the Torrens system of registration. Most of the early Torrens properties have been removed from this registration.

TORT - A wrongful act; wrong, injury; violation of a legal right, such as fraud or deceit; tort of fraud or deceit has five elements: a false representation made to the plaintiff by the

defendant, knowledge that the representation was false, representation made with the intention that the plaintiff should act upon it, belief by the plaintiff in the truth of the defendant's statement, action by the plaintiff upon the statement to the plaintiff's damage.

TOWNSHIP - A territorial subdivision six miles long, six miles wide and containing 36 sections, each one mile square. Created by lines parallel to the base line at six mile intervals.

TRADE-IN - An increasingly popular method of guaranteeing an owner a minimum amount of cash from his present property to permit him to purchase another. If the property is not sold within a specified time at the listed price the broker agrees to arrange financing to purchase the property at an agreed upon discount.

TRADE-IN-FEE - A fee charged by a broker to compensate for his risk in guaranteeing an owner of a home his equity in cash by a specified date.

TRADES - Used interchangeably with "exchange". Transaction in which owners transfer rights in a particular property for rights in another. Requires its own form of transfer document. Highly developed by members of the Internation Trader's Club.

TRANSFER BOOKS - Books required to be kept by the county auditor, showing all transfers of real estate within the county.

TRANSITION - Change.

TREASURE TROVE - Money, gold, silver or bullion found hidden, the owner of which is unknown.

TREND - A series of related events.

TRESPASS - An entry on the ground of another without lawful authority.

TRIM - The finish materials in a building, such as moldings, applied around openings or at the floor and ceiling.

TRUST - A right of property held by one for the benefit of another.

TRUST ACCOUNT - A bank account separate and apart and physically segregated from broker's own funds, in which broker is required by state law to deposit all moneys collected for clients.

TRUST DEED - A conveyance of real estate to a third person to be

USURY - Charging more than the lawful rate of interest for the use of money.

VALID - Having force of building force; legally sufficient and authorized by law.

VALLEY - The internal angle formed by the junction of two sloping sides of a roof.

VALUATION - Estimated worth or price; the act of valuing by appraisal; a professional process of estimation.

VALUE - The present worth of all the rights to future benefits arising from ownership; the quantity of one thing that will be given in exchange for another thing - the relationship between a thing desired and a potential purchaser, or the present worth of future rights and benefits to the typical buyer; people make value; value is in the minds of men.

VENDEE - A purchaser; buyer.

VENEER - Thin sheets of wood.

VENDOR - A seller; one who disposes of a thing in consideration of money.

VENDOR'S LIEN - An equitable lien which the vendor of land has thereon for the unpaid purchase - money.

VENT - A pipe installed to provide a flow of air to or from a drainage system to protect trap seals from siphonage or back pressure.

VERBAL - This word, when used with reference to a contract, or to evidence, means spoken, not written.

VERIFICATION - Sworn statement before a duly qualified officer to correctness of contents of an instrument.

VESTED - Bestowed upon someone; secured by someone, such as title to property.

VOID - To have no force or effect; that which is unenforceable.

VOIDABLE - That which is capable of being adjudged void, but is not void unless action is taken to make it so.

VOLUNTARY LIEN - Any lien placed on property with consent of, or as a result of, the voluntary act of the owner. A mortgage.

8226

WAINSCOTING - Wood lining of an interior wall; lower section of a wall when finished differently from the upper part.

WAIVER - Voluntary relinquishment or abandonment of an enforceable promise.

WARRANTY - A representation or promise in a contract.

WARRANTY DEED - One that contains a covenant that the grantor will protect the grantee against any claimant; contains covenants of title, against encumbrances, and of quiet enjoyment.

WATER TABLE - Distance from surface of ground to a depth at which natural ground water is found.

WEALTH - All things subject to man's ownership; all the useful things owned by man.

WILL - A legal declaration or testament of a person's wishes for the disposition of his property after death.

WILLAMETTE MERIDIAN - The north-south line extending from the northern border of California to the southern boundary of Canada, intersecting with the base line at a point in Multnomah County, Oregon, about 3 miles west and slightly north of the present county courthouse in that county.

WITHOUT RECOURSE - Words used in endorsing a note or bill to denote that the future holder is not to look to the endorser in the event of nonpayment.

WRIT OF EXECUTION - A writ which authorizes and directs the proper officer of the court to carry into effect the judgment or decree of the court.

ZONE - An area set off by proper authorities for specific uses, subject to certain restrictions or restraints. (Residential zone, commercial zone, industrial zone, light manufacturing zone, etc.)

ZONING ORDINANCE - Exercise of police power of a municipality in regulating and controlling the character and use of property.

DEFINITIONS

696.005 [1963 c.580 §39; repealed by 1965 c.617 §8]

696.010 Definitions. As used in ORS 696.010 to 696.490 and 696.610 to 696.730, unless the context requires otherwise:

(1) "Associate real estate broker" is a person who has qualified as a real estate broker and who works with a designated broker and whose license states that he is associated with a designated broker.

(2) "Board" means the Real Estate Board.

(3) "Commissioner" means the Real Estate Commissioner.

(4) "Compensation" means any fee, commission, salary, money or valuable consideration for services rendered or to be rendered as well as the promise thereof and whether contingent or otherwise.

(5) "Division" means the Real Estate Division of the Department of Commerce.

(6) "Inactive license" means a license which has been returned to the commissioner and is being held by the commissioner on an inactive status.

(7) "Real estate" includes leaseholds as well as any and every interest or estate in land, whether corporeal or incorporeal, whether freehold or nonfreehold and whether the land is situated in this state or elsewhere.

(8) "Real estate broker" means any person who, for another and for compensation or with the intention or in the expectation or upon the promise of receiving or collecting compensation:

(a) Sells, exchanges, purchases, rents or leases real estate.

(b) Offers to sell, exchange, purchase, rent or lease real estate.

(c) Negotiates, offers, attempts or agrees to negotiate the sale, exchange, purchase, rental or leasing of real estate.

(d) Lists, offers, attempts or agrees to list real estate for sale.

(e) Appraises, offers, attempts or agrees to appraise real estate.

(f) Auctions, offers, attempts or agrees to auction real estate.

(g) Buys, sells, offers to buy or sell or otherwise deals in options on real estate.

(h) Collects, offers, attempts or agrees to collect rental for the use of real estate.

(i) Advertises or holds himself out as being engaged in the business of buying, selling, exchanging, renting or leasing real estate.

(j) Assists or directs in the procuring of prospects, calculated to result in the sale, exchange, leasing or rental of real estate.

(k) Assists or directs in the negotiation or closing of any transaction calculated or intended to result in the sale, exchange, leasing or rental of real estate.

(9) "Real estate broker" also means any person employed by or on behalf of the owner of real estate at a stated salary or upon a commission or upon a salary and commission basis or other compensation to sell, exchange or offer for sale such real estate, or any part thereof, and who shall sell or exchange, or offer or attempt or agree to negotiate the sale or exchange of any lot or parcel of real estate.

(10) "Real estate salesman" means any person, who, for compensation or in the expectation or upon the promise thereof, is employed or engaged by a licensed real estate broker to do any act or deals in any transaction set out in subsection (8) of this section for or on behalf of such licensed real estate broker.

[Amended by 1953 c.166 §5; 1955 c.322 §6; 1965 c.617 §1]

REAL ESTATE BROKERS AND SALESMEN

696.020 Real estate brokers and salesmen required to be licensed. (1) No person shall engage in or carry on or advertise or hold himself out as engaging in or carrying on the business, or act in the capacity of, a real estate broker or a real estate salesman within this state without first obtaining a license as a real estate broker or a real estate salesman as provided for in this chapter.

(2) A person who is licensed as a real estate broker or real estate salesman shall be bound by and subject to the requirements of ORS 696.010 to 696.490, 696.610 to 696.730 and 696.990 in doing any of the acts specified by subsection (8) or (9) of ORS 696.010:

(a) While acting for another; and

(b) While acting in his own behalf.

[Amended by 1969 c.674 §1]

696.030 Certain persons exempted. ORS 696.010 to 696.375, 696.395 to 696.490, 696.710 to 696.730 and 696.990 do not apply to, and the terms "real estate broker" and "real estate salesman" do not include:

(1) Any person, partnership, association or corporation who, as owner, lessor or lessee, performs any acts with reference to property owned or leased by him or it; or any regular employe of any person, partnership, association or corporation who performs any acts with reference to property owned or leased by such person, partnership, association or corporation which are incidental to other principal activities or business of a nonreal estate nature of the employer.

(2) Any person acting as attorney in fact under a duly executed power of attorney from the owner authorizing the final consummation by performance of any contract for the sale, leasing or exchanging of real estate, if the power of attorney is recorded in the office of the recording officer for the county in which the property to be sold, leased or exchanged is located.

(3) Any attorney at law rendering services in the performance of his duties as an attorney at law.

(4) While acting as such, any receiver, trustee in bankruptcy, administrator or executor; or any trustee, or the regular salaried employes thereof, acting under a trust agreement, deed of trust or will.

(5) Any person doing any of the acts specified in subsection (8) or (9) of ORS 696.010 under order of any court.

(6) Any person employed by and acting for a single non-licensed corporation, partnership, association or individual in the management, but not sale, of commercial properties.

(7) Any registered professional engineer or architect appraising, offering, attempting or agreeing to appraise real estate where such appraisal primarily involves the utilization of the specialized knowledge of such registered professional engineer or architect and is not made for the purpose of establishing the sale value of the property.

(8) Any person employed by a single corporation, partnership, association or individual acting for the unit owner of a condominium as defined in ORS 91.505 to 91.675 in the rental and management of such unit as a hotel or motel guest accommodation.

[Amended by 1955 c.322 §7; 1963 c.593 §1; 1967 c.277 §1; 1969 c.674 §2]

696.040 Single act sufficient to constitute actor broker or salesman. One act or transaction in consideration of compensation, by fee, commission, salary or otherwise, or with the intention or in the expectation or upon the promise of receiving or collecting a fee of the kind or nature described in the definition of a real estate broker in subsection (8) or (9) of ORS 696.010, whether the act is an incidental part of a transaction, or the entire transaction, shall constitute the person offering or attempting to perform the act or transaction a real estate broker or a real estate salesman within the meaning of this chapter.

[Amended by 1955 c.322 §8]

696.050 Qualifications of applicants for licenses. (1) Licenses shall be granted only to persons who are trustworthy and competent to transact the business of a real estate broker or real estate salesman in such manner as to safeguard the interests of the public and only after satisfactory proof has been presented to the commissioner. Every applicant for a license as a real estate broker or salesman shall:

(a) Be of the age of 21 years or over;

(b) Be a citizen of the United States;

(c) Have established his residence in Oregon prior to filing his application, with the exception that a licensed broker or salesman who is currently licensed by a state, and who is a resident of that state, may file his application for a broker's or salesman's license as a nonresident licensee, providing that the state by which he is currently licensed has a law which meets the requirements of ORS 696.250; and

(d) Possess a high school diploma or have passed an equivalency examination in lieu thereof, or show satisfactory evidence of completion of a course in real estate practice and theory of at least 20 hours duration in a school licensed or approved by the Department of Education, or a similar course of instruction of like duration in a community college or area education district. Any person licensed prior to July 1, 1974, shall not be required to meet this standard.

(2) In order to qualify for a broker's license, the applicant must also furnish proof satisfactory to the commissioner that:

(a) He was actively engaged in business and duly licensed as a real estate salesman for a period of at least three years prior to the date of his application; or

(b) He has taken and successfully completed a course of instruction in real estate principles, practices and procedures, which in the opinion of the commissioner is the equivalent of three years' experience as a real estate salesman; or

(c) At the discretion of the board, he has had other experience in the selling, appraising or management of real estate equivalent to three years' experience as a real estate salesman, and evidences such experience by detailed explanatory affidavit to establish the nature of such experience; or

(d) He has a combination of partial fulfillment of the qualifications described by paragraphs (a), (b) and (c) of this subsection which in the opinion of the board or commissioner, or both as the case may be, is the equivalent of three years' experience as a real estate salesman.

(3) If an applicant qualifies with only appraisal experience, his license shall be restricted to appraisal activity.

(4) Brokers licensed under the laws of the state on August 22, 1969, are not required to meet the requirement of subsection (2) of this section.

(5) No broker's license shall be issued to a partnership, association or corporation unless all the members of the partnership, association or corporation who will actively engage in the real estate business and all the officers and directors of the corporation who will actively engage in the business of real estate are 21 years of age or over and citizens of the United States. The commissioner, at his discretion, may issue a license to any person not a citizen of the United States who may be eligible for a license if due proof is made to the commissioner that he has declared his intention to become a citizen of the United States.

(6) If an applicant has been convicted of any crime enumerated in paragraph (m) of subsection (1) of ORS 696.300, such conviction may be accepted as conclusive evidence of the untrustworthiness of the applicant, and such conviction may, in and of itself, be sufficient grounds for refusal of license.

[Amended by 1955 c.322 §9; 1961 c.471 §1; 1963 c.412 §1; 1969 c.515 §1; 1969 c.674 §3]

696.060 Form and contents of application for real estate broker's license. Every applicant for a real estate broker's license shall apply therefor in writing upon blanks prepared or furnished by the division. The application for a broker's license shall be verified by the applicant. If the application is made by a partnership or an association, it shall be verified by at least two members thereof. If the application is by a corporation, it shall be verified by the president and secretary thereof. The application shall be in such form as the commissioner may prescribe and shall set forth:

(1) The name and address of the applicant. If the applicant is a partnership or an association, the name and address of each member shall be set forth. If the applicant is a corporation, the name and address of each officer and director shall be set forth.

(2) The name under which the business is to be conducted.

(3) The place or places, including the street number, town, village or city, and county where the business is to be conducted.

(4) The business or occupation theretofore engaged in by the applicant for a period of at least two years immediately preceding the date of such application, and the location thereof; if the applicant is a partnership or an association, by each member thereof, or if a corporation by each officer thereof.

(5) The time and place of the applicant's previous experience in the real estate business, as broker or salesman; if the applicant is a partnership or an association, by each member thereof, or if a corporation, by each officer thereof.

(6) Whether the applicant has ever been convicted of or is under indictment for forgery, embezzlement, obtaining money under false pretense, larceny, extortion, a crime involving moral turpitude, conspiracy to defraud or other like offense or offenses or has been disbarred from the practice of law; if the applicant is a partnership or an association, whether any member thereof has been so convicted, indicted or disbarred; if the applicant is a corporation, whether any officer or director has been so convicted, indicted or disbarred.

(7) Whether the applicant has been refused a real estate broker's or salesman's license or any other occupational or professional license in any other state or whether his license as a broker or salesman or in any other occupational or professional capacity has been revoked or suspended in any other state; if the applicant is a partnership or an association, whether any member thereof has had a license as a broker or salesman or in any other occupational or professional capacity which has been revoked or suspended in any other state; if the applicant is a partnership or an association, whether any member thereof has had a license as a broker or a salesman or in

any other occupational or professional capacity refused, suspended or revoked in any other state; if the applicant is a corporation, whether any officer thereof has had a license as a broker or a salesman or in any other occupational or professional capacity refused, suspended or revoked in any other state.

(8) If the applicant is a partnership, association or corporation, the name of the designated member or officer thereof who is to receive his license by virtue of the issuing of a license to the partnership, association or corporation as is provided for in ORS 696.080.

(9) If the applicant is a member of a partnership or association, or an officer of a corporation, the name and office address of the partnership, or association, or corporation of which the applicant is a member or officer.

696.070 Recommendations to accompany application. The application for a real estate broker's or salesman's license shall be accompanied by the recommendation of at least three resident citizens, not related to the applicant, who have owned real estate for a period of three years or more in the county in which the applicant resides or has or intends to establish his place of business, and who have known the applicant for a period of three years or more. The recommendation shall certify that the applicant bears a good reputation for honesty, truthfulness, fair dealing and competency, and shall recommend that a license be granted to the applicant. If the applicant cannot procure such recommendations for the reason that he has not resided within the county for a period of three years, he may furnish similar recommendations from three persons with like qualifications from any locality within or without the state where the applicant has resided within the three years prior to the filing of his application.
[Amended by 1963 c.412 §2]

696.080 Partnerships, associations and corporations; designating person to make application and pass examination. Every partnership and association, in its application for a license, shall designate and appoint one of its members, and every corporation in its application for a license shall designate and appoint one of its officers to submit an application for a broker's license. The application of the partnership, association or corporation, and the application of member or officer so designated, shall be filed with the commissioner together. No license shall be issued to any partnership, association or corporation unless and until the person or officer so designated by the partnership, association or corporation submits to and passes the examination required by ORS 696.010 to 696.490 and 696.610 to 696.730, on behalf of the partnership, association or corporation. Upon such member's or officer's successfully passing the examination and upon compliance with all other requirements of law by the partnership, association or corporation, as well as by the designated member or officer, the commissioner shall issue a broker's license to the partnership, association or corporation, which shall bear the name of such member or officer, and, thereupon, the member or officer so designated shall act as a real estate broker only as officer or agent of the partnership, association, or corporation, and not on his own behalf. If, in any case, the person so designated is refused a license by the commissioner or in case the person ceases to be connected with such partnership, association or corporation, the partnership, association or corporation shall have the right to designate another person who shall make application and qualify as in the first instance.

696.090 Certain firm members required to obtain broker's license. Each and every member or officer of a partnership, association or corporation who will perform or engage in any of the acts specified in subsection (8) of ORS 696.010, other than the designated member or officer of the partnership, association or corporation in the manner provided in ORS 696.080, shall be required to make application for and take out a separate broker's license in his own name individually; but the license issued to any such member or officer of a partnership, association or corporation shall entitle such member or officer to act as real estate broker only as officer or agent of the partnership, association or corporation, and not on his own behalf.
[Amended by 1955 c.322 §10]

696.100 Application for salesman's license. Every application for a salesman's license shall be made in writing upon a form prescribed by the commissioner and shall contain such information as is required in a broker's application, and also shall set forth

the period of time, if any, during which the applicant has been engaged in the real estate business, stating the name and address of his last employer. Every application for a salesman's license shall be verified by the applicant.
[Amended by 1963 c.412 §3]

696.110 Application and examination fee. (1) Every application for a license and any examination under ORS 696.010 to 696.490 and 696.610 to 696.730 shall be accompanied by the examination fee prescribed in ORS 696.270. The fee for all licenses issued shall, at all periods of the year, be the same as prescribed in ORS 696.270.

(2) No other license or fee shall be required of such licensee by any city, county, town or other political subdivision thereof.
[Amended by 1955 c.322 §11; 1961 c.309 §3; 1965 c.617 §2]

696.120 Commissioner may require additional information from applicants; rules and regulations. (1) Applications for a broker's or salesman's license shall contain such other information as to the applicant, in addition to that described in ORS 696.060 to 696.100, as the commissioner shall require. The commissioner may require such other proof, through the application, or otherwise, as he shall deem desirable, with due regard to the paramount interests of the public, as to the honesty, truthfulness, integrity and competency of the applicant.

(2) The commissioner expressly is vested with the power and authority to make and enforce any and all such reasonable rules and regulations connected with the application for any license as shall be deemed necessary to administer and enforce the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730.

696.130 Examination of applicants; issuance of salesman's license upon revocation of broker's license. (1) In addition to proof of honesty, truthfulness and good reputation of any applicant for a license, the applicant shall be required to pass a written examination to be conducted by the Real Estate Board. The examination shall include reading, writing, spelling, arithmetic and computation, salesmanship, appraising, accounts, real estate ethics, real estate taxation, problems in real estate and a general knowledge of the provisions of ORS 696.010 to 696.375, 696.395 to 696.490, 696.710 to 696.730 and 696.990.

(2) The board shall hold examinations at such times and places as it may determine, except that the board shall hold the examinations no less frequently than every 60 days. The examination for a broker's license shall differ from the examination for a salesman's license in that it shall be of a more exacting nature and require higher standards of knowledge of real estate. If the license of any real estate broker or salesman is revoked by the commissioner, no new license shall be issued to such person until he complies with the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730 unless at the time a broker's license is revoked the order authorizes the issuance of a salesman's license.
[Amended by 1955 c.322 §12; 1969 c.674 §4]

696.140 Reexamination. Any individual who fails to pass an examination conducted by the board pursuant to ORS 696.130 is ineligible for a similar examination until after the expiration of 60 days from the time he took the last examination, and then only upon making application and payment of the examination fee. An applicant who has failed two successive examinations shall be ineligible to take another examination until the expiration of one year from the date of the last examination taken. Any person who fails to take or pass the examination shall not be entitled to the return of any examination fees previously paid.
[Amended by 1961 c.471 §2; 1963 c.412 §4]

696.150 Examination where applicant is a partnership, association or corporation. If the applicant is a partnership, association or corporation, the examination shall be submitted to on behalf of the partnership, association or corporation by the member or officer thereof who is designated in the application as the person to receive a license by virtue of the issuing of a license to the partnership, or association, or corporation, as provided for in ORS 696.080.

696.160 Issuance of broker's or salesman's licenses. Upon satisfactorily passing the examination and upon complying with all other provisions of law and conditions of ORS 696.010 to 696.490 and 696.610 to 696.730, a license shall thereupon be granted by the commissioner to the successful applicant therefor as a real estate broker or a real estate salesman. The applicant, upon receiving his license, is authorized to conduct the business of a real estate broker or real estate salesman, as the case may be, between the

date of his license and the renewal date of his license, unless sooner revoked or suspended. Not more than one license shall be issued and outstanding to or in favor of any licensee at any one time.
[Amended by 1969 c.674 §5]

696.165 Issuance of associate broker's license and pocket card; application of chapter to associate brokers. (1) A real estate broker may act as a salesman for another broker if he obtains an associate broker's license. An associate broker's license may be obtained by a broker, without examination, by subscribing to an agreement that he will not engage in any act in the capacity of a broker other than as an employe of the employing broker, while associated with the employing broker. The form of this agreement is subject to the approval of the commissioner. Signed copies of the agreement shall be filed with the employing broker and the commissioner. Before an associate broker's license may be issued, the applicant must also surrender to the commissioner his real estate broker's license and pocket card for inactivation, which license and card shall remain inactive as long as his associate broker's license is outstanding and effective, and shall be reissued upon inactivation of his associate broker's license and compliance with the other provisions of ORS 696.010 to 696.490 and 696.610 to 696.730 relating to brokers.

(2) Upon approval of the agreement mentioned in this section, and the tender of the broker's license and pocket card to the commissioner, the commissioner shall issue, in the applicant's name, an associate broker's license and pocket card, the license to be delivered by the commissioner to the employing broker in accordance with ORS 696.180. The license shall designate the applicant as an associate real estate broker and he shall be known by that title. The pocket card shall be the same as that provided in ORS 696.190 for salesmen except that the designation "associate real estate broker" shall be substituted for "real estate salesman." The provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, other than ORS 696.130 to 696.150 that relate to and govern real estate salesmen shall also apply to and govern associate real estate brokers.
[1953 c.166 §4; 1969 c.674 §6]

696.170 [Amended by 1955 c.322 §13; repealed by 1969 c.674 §20]

Note: ORS 696.170 is repealed effective July 1, 1970. Until that time, ORS 696.170 (1967 Replacement Part) remains in effect.

696.172 License renewal period. There is established a staggered renewal period to coincide with the last day of the month of the birthdate of each licensee. A new license or renewal issued on July 1, 1970, shall be for the term of one year plus the additional calendar months up to and including the month in which the birthdate of the licensee occurs. On July 1, 1970, all licensees shall pay:

(1) The annual fee; and

(2) A sum for the additional months up to and including the month in which the birthdate of the licensee occurs. Such sum shall be computed as one-twelfth the annual fee for each month.
[1969 c.674 §9]

Note: ORS 696.172 to 696.176 take effect July 1, 1970. See 1969 c.674 §7.

696.174 License renewal date; effect of failure to make timely renewal. (1) Each license as a real estate broker, or real estate salesman may be renewed by the commissioner upon the payment by the licensee of the registration or renewal fee specified in ORS 696.270 if that fee is paid on or before the first day of the month following the month of the birthdate of the licensee.

(2) If the licensee fails to pay the registration or renewal fee on or before the first day of this month, the commissioner may accept a later payment, subject to such conditions as he may require; but between this last day of the month of his birthdate and the date of renewal of the license the rights of the licensee under such license shall be suspended, and during such suspension it is unlawful for any licensee to do or attempt or offer to do any of the acts of the kind and nature described in the definition of a real estate broker in subsection (8) of ORS 696.010 in consideration of compensation of any kind or expectation thereof.
[1969 c. 674 §11]

Note: See note under 696.172.

696.176 Terms of licenses. (1) A new license or renewal issued after July 1, 1970, shall be for the term of the months up to and including the month of the birthdate of the licensee. These licensees shall pay the annual fee for such license.

(2) Corporations, partnerships and associations shall have established as the equivalent of a birthdate, that date upon which the license is issued.

(3) Branch offices shall have established as the equivalent of a birthdate, the birthdate

8234

of the real estate broker or the agency establishing the branch office.
[1969 c.674 §10]

Note: See note under 696.172.

696.180 Form and content of license. The commissioner shall issue to each licensee a license in such form and size as shall be prescribed by the commissioner. The license shall show the name and address of the licensee and, in case of a real estate salesman's license, shall show the name of the real estate broker by whom he is employed. Each license shall have imprinted thereon the seal of the division and shall contain such other matter as shall be prescribed by the commissioner. The license of each real estate salesman shall be delivered or mailed to the real estate broker by whom such real estate salesman is employed and shall be kept in the custody and control of such broker.

696.190 Pocket cards to be issued. The commissioner shall prepare and deliver to each licensee a pocket card, which card, among other things, shall contain an imprint of the seal of the division and shall certify that the person whose name appears thereon is a licensed real estate broker or real estate salesman, as the case may be. If it is a real estate salesman's card it shall also contain the name and address of his employer. The matter to be printed on such pocket card, except as above set forth in this section, shall be prescribed by the commissioner.

696.200 Real estate broker to maintain place of business; branch offices; removal from state; change of business location. (1) Except for nonresident brokers licensed pursuant to ORS 696.250 and associate brokers licensed pursuant to ORS 696.165, every real estate broker shall maintain in this state a place of business to be designated as his main office and designate such place of business by a sign which shall contain the name under which he conducts his business, together with the words "Real Estate," or if a member of the National Association of Real Estate Boards he may use the word "Realtor." Such sign shall be written in letters not less than one inch in height and placed so that it can easily be observed and read by anyone entering the place of business.

(2) The place of business shall be specified in the application for license, and designated in the license. No license issued under ORS 696.010 to 696.490 and 696.610 to 696.730 authorizes the licensee to transact business from any office other than that designated in the license, unless notice in writing is given to the commissioner prior to any such change of business location, designating the new location of such office, at which time the broker shall send in his license and pocket card and the licenses and pocket cards of the salesmen in his employ with the fee required by ORS 696.270 for each new license. The commissioner forthwith shall issue a new license for the new location for the unexpired period. The change of a business location without notification to the commissioner is grounds for cancellation of licenses previously issued.

(3) If a broker desires to establish one or more branch offices, he shall notify the commissioner, giving the location thereof, and pay the fee required by ORS 696.270 for each branch office to be established, whereupon the commissioner may issue a license therefor. The branch office license shall be issued in the same name that the main office license is issued, and the license must be posted in such place of business. Branch office signs shall conform with the provisions of subsection (1) of this section and the designation "Branch Office" shall be included. Each branch office shall be under the management of an associate real estate broker or of a licensed real estate salesman with at least two years' experience as a duly licensed real estate salesman immediately preceding the management of the branch office. The license of such broker or salesman shall state that he is associated with or employed by, as the case may be, the broker licensed to establish the branch office.

(4) Except for nonresident brokers licensed pursuant to ORS 696.250, when a broker currently licensed in Oregon terminates his Oregon residence he shall immediately surrender his broker's license to the commissioner. The commissioner shall hold the license as inactive until residency is reestablished by the broker or the license expires. Failure to surrender the license to the commissioner upon the termination of residency is grounds for cancellation of the license. All salesman's licenses in the custody of the broker at the time his residency is terminated shall be surrendered to the commissioner to be held as an inactive license or may be transferred to a qualified broker upon

8235

the payment of the fee specified in ORS 696.270. Absence from the state for a period in excess of 90 days is to be considered prima facie evidence of a termination of residency for the purpose of this section unless evidence satisfactory to the commissioner is furnished that such broker has not, in fact, changed his residence, and that such absence from the state is temporary only.

(5) Upon removal from any location it shall be his duty to see that his name or the name under which he has operated is removed from the location which he has vacated. A broker shall not display any name as such at the designated places of business named in his license or licenses other than the name under which he is licensed.

[Amended by 1955 c.322 §14; 1961 c.471 §3; 1965 c.367 §1]

696.210 Display of licenses at place of business. Each real estate broker shall display prominently in his principal place of business his own license as well as the licenses of all real estate salesmen employed by him therein or in connection therewith.

696.220 [Repealed by 1955 c.322 §15]

696.221 Return of salesman's license to commissioner. (1) A real estate broker at any time may, and at the request of the salesman shall without delay, return the license of a real estate salesman to the commissioner. When, and only when, the license of a salesman is returned to the commissioner, the relationship of the broker returning the license and the salesman whose license is returned, is, for the purposes of ORS 696.010 to 696.490 and 696.610 to 696.730, terminated. Before the broker returns the license of a salesman to the commissioner he shall make a reasonable attempt to give the salesman notice of his intent so to do.

(2) After the license of a salesman has been returned to the commissioner under subsection (1) of this section by the employing broker it may:

(a) Become an inactive license.

(b) Be reissued to the same broker.

(c) Be reissued to a different broker.

[1955 c.322 §4; 1969 c.674 §12]

696.224 Inactive real estate salesman's license. (1) The license of a real estate salesman becomes an inactive license if it is not reissued, revoked or suspended within 10 days after his employment with a broker is terminated.

(2) The license of a real estate salesman shall be reissued to the same or a different broker when, within 10 days after termination of his employment with a broker:

(a) Notice of his employment by the broker and the name of the employing broker is given to the commissioner by the real estate salesman; and

(b) The fee prescribed by ORS 696.270 for the transfer of licenses has been paid to the commissioner.

[1955 c.322 §5; 1969 c.674 §13]

696.226 Surrender of broker's license to commissioner; inactive licensee not to engage in business; renewal, reactivation, revocation or suspension of inactive licenses. (1) When a broker ceases to maintain a place of business he shall surrender his license to the commissioner, who shall keep such license on record as an inactive license. The license of a salesman becomes inactive as provided in subsection (1) of ORS 696.224.

(2) While his license is being held by the commissioner as an inactive license, the licensee shall not engage in, or carry on, or advertise or hold himself out as engaging in or carrying on the business of a real estate broker or a real estate salesman within this state.

(3) Inactive licenses may be:

(a) Renewed upon the payment of the renewal fee specified in ORS 696.270.

(b) Reactivated upon application to the commissioner and the payment of the reactivation fee specified in ORS 696.270.

(c) Revoked or suspended by the commissioner when conditions exist under which the commissioner would have been authorized to revoke or suspend the license if it were active.

[1955 c322 §2]

696.228 Surrender of associate broker's license; inactive licensee not to engage in business; renewal, reactivation, revocation or suspension of inactive license. (1) When an associate real estate broker ceases to act as a salesman for another broker he shall surrender his associate broker's license to the commissioner who shall keep such license on record as an inactive license.

(2) While his associate broker's license is being held by the commissioner as an inactive license, the licensee shall not engage in, or carry on, or advertise or hold himself out as a salesman for another broker.

(3) Inactive licenses may be:

(a) Renewed upon the payment of the renewal fee specified in ORS 696.270.

(b) Reactivated upon application to the commissioner and the payment of the reactivation fee specified in ORS 696.270.

(c) Revoked or suspended by the commissioner when conditions exist under which the commissioner would have been authorized to revoke or suspend the license if it were active. [1969 c.674 §8]

Note: ORS 696.228 takes effect on July 1, 1970. See 1969 c.674 §7.

696.230 [Repealed by 1969 c.674 §21]

696.240 Disposition of funds received by brokers. Every person, partnership or corporation licensed as a real estate broker, who does not immediately place all funds entrusted to him in his capacity as a real estate broker by his principal or others in a neutral escrow depository in this state, shall maintain a trust fund account with some bank or recognized depository located in this state and place all such entrusted funds therein upon receipt. The Real Estate Division shall establish rules and regulations to provide for records to be maintained and the manner in which such deposits shall be made.
[Amended by 1957 c.383 §1; 1963 c.580 §49]

696.250 Licensing of nonresidents. (1) A nonresident of this state who is a licensed broker in another state may obtain a license as a broker in this state by complying with all provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, provided that the nonresident broker is regularly engaged in the real estate business and maintains a place of business in the [illegible] state, and provided that that state offers the same privileges to the licensed broker [illegible] this state. Such nonresident licensee may not maintain a place of business within this state. The commissioner may license such nonresident broker without examination, provided that he has qualified for a broker's license in the state in which he resides by written examination, and also that his state of residence permits licenses to be issued without written examination to brokers resident in and licensed by this state. The commissioner may, in his discretion, refuse to issue a broker's license to an applicant who is not a resident of this state.

(2) The commissioner may issue a nonresident salesman's license to the salesman of a licensed nonresident broker.

(3) When a nonresident broker no longer regularly engages in the real estate business or maintains a place of business in the state of his resident real estate broker's license, his nonresident broker's license and the nonresident salesman's licenses of salesmen in his employ shall be surrendered to the commissioner.
[Amended by 1953 c.202 §2; 1961 c.675 §1; 1965 c.367 §2; 1969 c.674 §14]

696.260 Acceptance of license by nonresident as appointment of commissioner as agent for service; service of process on nonresident broker. The acceptance, by a nonresident, of a license as a real estate broker under this section and ORS 696.250, shall be deemed equivalent to an appointment by such nonresident of the Real Estate Commissioner of this state as his true and lawful attorney, upon whom may be served any lawful summons, process or pleading in any action or suit against him, in any court of this state, arising out of any business done by him as a real estate broker in this state, and such acceptance shall be deemed equivalent to an agreement by such nonresident that any summons, process or pleading so served shall be of the same legal force and validity as if served on him personally in this state. If it appears by the certificate of the sheriff of the county in which an action or suit has been filed against such a nonresident broker, that the defendant cannot be found in this state, service of any summons, process or pleading in the action or suit may be made by leaving a copy thereof, with a fee of $2, in the hands of the commissioner or in his office. Such service shall be sufficient and valid personal service upon the defendant; provided that notice of such service and a copy of the summons, process or pleading is sent forthwith by registered mail by the plaintiff or his attorney to the defendant, at the most recent address furnished to the commissioner by the nonresident broker or to his last-known address, and the affidavit of the plaintiff or his attorney of such mailing is appended to the summons, process or pleading and entered as a part of the return thereof. However, personal service outside of the state in accordance with the statutes relating to personal service of summons outside of the state shall relieve the plaintiff from such mailing requirement. Any summons served as provided in this section shall require the defendant to appear and answer the complaint within four weeks after receipt thereof by the commissioner. The court in which

the action or suit is brought may order such continuances as may be necessary to afford the defendant reasonable opportunity to defend the action. The fee of $2 paid by the plaintiff to the commissioner shall be taxed as costs in favor of the plaintiff if he prevails in the action. The commissioner shall keep a record of each summons, process or pleading served upon him under this section, showing the day and hour of service.

696.270 Fees. The following fees shall be charged by and paid to the Real Estate Division:

(1) For each examination applied for, $10.

(2) For each real estate broker's license, $25; and for each annual registration or renewal of a real estate broker's license thereafter, $25.

(3) For each license as real estate broker issued to a member of a partnership, association, or officer of a corporation other than the member of the partnership or association, or officer of the corporation named in the license issued to such partnership, association or corporation, $25; and for each annual registration or renewal of such license thereafter, $25.

(4) For each associate broker's license a fee of $25 and for each annual registration or renewal a fee of $25.

(5) For each real estate salesman's license, $15; and for each annual registration or renewal of such license thereafter, $15.

(6) For each additional office or place of business, an annual fee of $5.

(7) For each change of name or address of a broker on the records of the department, $5.

(8) For each duplicate license, where the original license is lost or destroyed and affidavit made thereof, $2.

(9) For each salesman's or associate broker's license issued when change of business location or change of name, $1.

(10) For each transfer of salesman's license, $5.

(11) For each duplicate registration, where the original card is lost or destroyed and affidavit made thereof, $1.

(12) For certified copies of any record in the office of the commissioner, $2 for each certificate, and 25 cents per folio for matter certified; for uncertified copies, 25 cents per folio.

(13) For the renewal of a broker's inactive license, $10.

(14) For the renewal of a salesman's inactive license, $7.50.

(15) For the reactivation of a broker's inactive license, $25, for the reactivation of an associate broker's inactive license, $25, and for the reactivation of a salesman's inactive license, $15.

(16) In addition to the annual renewal or registration fee, for late renewal or late annual registration, $10.

[Amended by 1953 c.166 §5; 1955 c.457 §1; subsections (13), (14) and (15) enacted as 1955 c.322 §3; 1957 c.383 §2; 1961 c.670 §1; 1965 c.617 §3; 1969 c.674 §15]

696.280 Real estate brokers to keep records. Every person licensed as a real estate broker shall keep records of all real estate transactions handled by or through him, which records shall include copies of earnest money receipts and closing statements showing all receipts, disbursements and adjustments, also copies of listing contracts, if any. Such records shall at all times be open for inspection by the commissioner or his duly authorized representatives. The records of each transaction shall be kept by the broker for a period of not less than six years after the date of the transaction. Violation by a real estate broker of any of the provisions of this section is grounds for revocation or suspension of licenses issued to such broker.

696.290 Sharing commission with unlicensed person prohibited. No licensed broker or salesman shall offer, promise, allow, give, pay or rebate, directly or indirectly, any part or share of his commission or compensation arising or accruing from any real estate transaction to any person who is not a licensed broker or licensed real estate salesman licensed under ORS 696.010 to 696.490 and 696.610 to 696.730. However, a licensed broker may pay a finder's fee or a share of his commission on a cooperative sale where such payment is made to a licensed broker in another state provided that the state in which he is licensed has a law permitting brokers to cooperate with brokers in this state and that such nonresident broker does not conduct in this state any of the negotiations for which a fee, compensation or commission is paid. No real estate salesman shall be employed by, or accept compensation from, any person other than the broker under whom he is licensed at the time, and no broker shall

make payment to the salesman of another broker except through the salesman's employing broker. Nothing in this section prevents payment of a commission or fee earned by such salesman while licensed, because of change of employment or inactivation of his license.

[Amended by 1953 c.42 §2; 1961 c.670 §2; 1969 c.674 §16]

696.300 Grounds for revocation or suspension of licenses. (1) The commissioner may, upon his own motion, and shall upon the verified complaint in writing of any person, provided such complaint, or such complaint together with evidence, documentary or otherwise, presented in connection therewith, shall make a prima facie case, investigate the actions of any real estate broker or real estate salesman, or any unlicensed person who assumes to act in either such capacity within this state, and has the power to suspend or revoke any license issued under ORS 696.010 to 696.490 and 696.610 to 696.730 at any time where the licensee has by false or fraudulent representation obtained a license, or where the licensee, in performing or attempting to perform any of the acts mentioned in ORS 696.010 to 696.490 and 696.610 to 696.730 is deemed to be guilty of:

(a) Making any substantial misrepresentations.

(b) Making any false promises of a character likely to influence, persuade or induce.

(c) Pursuing a continued and flagrant course of misrepresentation, or making of false promises through agents or salesmen or advertising or otherwise.

(d) Using the term "Realtor" by one not a member of the National Association of Real Estate Boards, or using any other trade name or insignia of membership in any real estate organization of which the licensee is not a member.

(e) Acting for more than one party in the transaction without the knowledge of all parties for whom he acts.

(f) Accepting a commission or valuable consideration as a real estate salesman for the performance of any of the acts specified in ORS 696.010 to 696.490 and 696.610 to 696.730, from any person, except his employer, who must be a licensed real estate broker.

(g) Representing or attempting to represent a real estate broker other than the employer, without the express knowledge and consent of the employer.

(h) Failing, within a reasonable time, to account for or to remit any moneys or to surrender to the rightful owner any documents or other valuable property coming into his possession which belong to others; or issuing an appraisal report on real property in which he has an interest, unless the nature and extent of such interest is fully disclosed in the report.

(i) Disregarding or violating any provisions of ORS 696.010 to 696.490 and 696.610 to 696.730.

(j) Making, printing, distributing or in any manner publishing misleading or untruthful advertising, descriptions or promises, of such character as reasonably to induce any person to act to his damage or injury.

(k) Paying or receiving any rebate, profit, compensation or commission in violation of ORS 696.010 to 696.490 and 696.610 to 696.730.

(L) Inducing any party to a contract, sale or lease to break such contract, for the purpose of substituting in lieu thereof a new contract with the same principal or a different principal, where such substitution is motivated by the personal gain of the licensee.

(m) Forgery, embezzlement, obtaining money under false pretenses, larceny, extortion, conspiracy to defraud, a crime of moral turpitude, or other like offense or offenses, and who had been convicted thereof in a court of competent jurisdiction of this or any other state.

(n) Guaranteeing or having authorized or permitted any person to guarantee future profits which may result from the resale of real property.

(o) Placing a sign on any property offering it for sale or for rent without the authority of the owner or his authorized agent.

(p) Soliciting, selling or offering for sale real property by offering "free lots," or conducting lotteries or contests, or offering prizes for the purpose of influencing a purchaser or prospective purchaser of real property.

(q) Any act or conduct, whether of the same or a different character than specified above in this section, which constitutes or demonstrates bad faith, incompetency or untrustworthiness, or dishonest, fraudulent or improper dealings.

BESS

8239

(r) Failing for any reason to pay to the commissioner the annual registration or renewal fee as specified in ORS 696.270 promptly and before the time specified in that section.

(s) Commingling the money or other property of his principal or client with his own.

(t) Failing or refusing upon demand to produce any document, book or record in his possession concerning any real estate business transacted by him, for inspection of the Real Estate Commissioner or his authorized representative.

(u) Failing to maintain at all times in his principal place of business a complete record of every transaction which comes within the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730.

(v) Violating ORS 659.033.

(2) The commissioner shall, in addition, have power to revoke or suspend any license issued under the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, at any time, where the licensee performs any act or offers, attempts or agrees to do any act, for which the commissioner lawfully may refuse to issue a license to any applicant.

[Amended by 1959 c.585 §1; 1961 c.670 §3; 1969 c.674 §17]

696.310 Effect of revocation on licensed associates. Any unlawful act or violation of any of the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730 by any licensee is not cause for the suspension or revocation of a license of any employer, employe, salesman, partner, member or officer associated with or employed by such licensee, unless it appears to the satisfaction of the commissioner that such employer, employe, salesman, partner, member or officer, had guilty knowledge thereof. A course of dealing shown to have been persistently and consistently followed by any real estate salesman, employe, partner, associate or officer shall constitute prima facie evidence of such knowledge upon the part of the employer, partner, associate or officer. In the event of the revocation or suspension of the license issued to any member of a partnership or to any officer of an association or corporation, the license issued to such partnership, association or corporation shall be revoked by the commissioner, unless, within a time fixed by the commissioner, where a partnership, the connection therewith of the member whose license has been revoked is severed and his interests in the partnership and his share in its activities brought to an end, or, where an association or corporation, the offending officer is discharged and has no further participation in its activities. However, the discharged or withdrawing member or officer of such partnership, association or corporation may reassume his connection with, or be reengaged by such partnership, association or corporation upon termination of the suspension or reinstatement of his license.

696.320 Effect of suspension or revocation of employing broker's license on salesman. The suspension or revocation of a broker's license shall suspend automatically every salesman's license pending a change of employer or the issuance of a new license. Such new license shall be issued without charge, if granted during the same year in which the original license was granted, upon the receipt of the salesman's original license and pocket card.

[Amended by 1969 c.674 §18]

696.330 Hearing by commissioner prior to refusing, suspending or revoking license. The commissioner shall, before denying the application for a license or before suspending or revoking any license, set the matter down for a hearing and, at least 20 days prior to the date set for the hearing, shall notify the applicant or licensee in writing, which notice shall contain an exact statement of the charges made and the date and place of the hearing and shall afford the applicant or licensee an opportunity to be heard in person or by attorney in reference thereto. The written notice may be served by delivering it personally to the applicant or licensee, or by mailing it by registered mail to the last-known business address of the applicant or licensee. If the applicant or licensee is a salesman the commissioner also shall notify the broker employing him or in whose employ he is about to enter by mailing notice by registered mail to the broker's last-known business address. The hearing on such charges shall be held before the commissioner at such time and place as the commissioner shall prescribe, and the hearing may be continued from time to time.

[Amended by 1967 c.206 §1]

696.340 Powers of commissioner in relation to hearings. The commissioner shall have the power:

(1) To administer oaths.

(2) To certify to all official acts.

(3) To subpena and bring before him any person in the state as witness.

(4) To require the production of books and papers.

(5) To swear witnesses.

(6) To take testimony of any person by deposition.

696.350 Subpenas and witnesses; decision of commissioner. Subpenas issued pursuant to the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730 shall be served in the same manner as subpenas may be served in any civil action in this state and the same fees and mileage shall be allowed in all such cases as are allowed by law in the trial of civil cases in a justice court. Any party to any such hearing shall have the right to the attendance of witnesses in his behalf at such hearing, upon making request therefor to the commissioner, designating the person sought to be subpenaed and advancing the witness fees and mileage for each such witness, and shall have the right to examine and cross-examine witnesses for and against him, either in person or by legal counsel. In all cases where the commissioner deems it necessary and proper to subpena witnesses at the expense of the division, he may do so, and such fees and expenses of any hearing may be paid out of the funds specified in ORS 696.490. The circuit court in the county in which the hearing may be held shall have the power to compel the attendance of witnesses, the giving of testimony and the production of books and papers as required by any subpena issued by the commissioner. In case of the refusal of any witness to attend or testify or produce any books or papers required by such subpena, the commissioner may report to the circuit court in the county in which the hearing is pending by petition, setting forth that due notice has been given of the time and place of attendance of the witness or the production of books and papers and that the witness has been summoned in the manner prescribed in the subpena or has refused to answer questions propounded to him in the course of such hearing, and ask an order of the court compelling the witness to attend and testify or produce the books or papers before the commissioner in charge of any such hearing. The court thereupon shall enter an order directing the witness to appear before the court at a time and place to be fixed by the court in such order, and then and there to show cause why he has not attended or testified or produced the books and papers at the hearing. A copy of the order shall be served upon the witness. If it appears to the court that the subpena was regularly issued the court thereupon shall enter an order that the witness appear before the commissioner at the time and place fixed in the order and testify or produce the required books and papers, and, upon the failure to obey the order, the witness shall be dealt with as for contempt of court. In each case a decision shall be rendered by the commissioner in writing and filed in the proceeding. If, after the hearing, the commissioner determines that an applicant is not qualified to receive a license, a license shall not be granted to the applicant, and, if the commissioner determines that any licensee is guilty of a violation of any of the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, his license shall be canceled or revoked.

696.360 Appeal from commissioner's decision. In case of the refusal, revocation or suspension of a license by the commissioner under the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, the applicant whose application is so refused, and the licensee whose license is revoked or suspended by the commissioner, shall have the right to appeal from the decision of the commissioner so refusing, revoking or suspending such license within 60 days after the filing of the decision in the office of the commissioner in the manner provided by ORS 183.480.
[Amended by 1967 c.206 §2]

ADMINISTRATION

696.375 Real Estate Division; Real Estate Commissioner; salary and bond of commissioner. (1) The Real Estate Division is established within the Department of Commerce.

(2) The Real Estate Division shall be under the supervision and control of an administrator who shall be known as the Real Estate Commissioner. The Director of Commerce shall, with the approval of the Governor, appoint the Real Estate Commissioner who shall have been, before the date of his appointment, for five years a real estate broker actively engaged in business as such in this state or actively connected with the administration of the Real Estate Division or

its predecessor, the Oregon Real Estate Department. The commissioner shall hold his office at the pleasure of the Director of Commerce and shall be responsible for the performance of the duties imposed upon the division. The Real Estate Commissioner shall receive such salary as may be provided by law.

(3) Twenty percent of the annual salary of the Real Estate Commissioner shall be paid from the Collection Agency Account, to be paid monthly out of the State Treasury upon warrant from the Secretary of State.

(4) Before entering upon the duties of his office the commissioner shall give to the state a fidelity bond with one or more corporate sureties authorized to do business in this state in the sum fixed by the Director of Commerce. The premium for the bond shall be paid by the division.

[1963 c.580 §§40, 41]

696.380 [Repealed by 1963 c.580 §103]

696.385 Power of division. The Real Estate Division shall have the power to:

(1) Adopt a seal by which it shall authenticate its proceedings.

(2) From time to time, prepare and cause to be printed and circulated among the real estate licensees of Oregon such printed matter as it may deem helpful or educational or proper for the guidance and welfare of such licensees.

(3) Make and enforce any and all such reasonable rules and regulations as shall be deemed necessary to administer and enforce the provisions of, and enforce and discharge the duties defined in, any law with the administration or enforcement of which the division is charged.

[1963 c.580 §48; 1965 c.617 §5]

696.390 [Repealed by 1963 c.580 §103]

696.395 Power of commissioner. The Real Estate Commissioner shall have the power to:

(1) For the purpose of administration, with the approval of the Director of Commerce, organize and reorganize, as necessary, the division in the manner that he deems necessary to properly conduct the work of the division.

(2) Appoint all subordinate officers and employes of the division and prescribe their duties and fix their compensation, subject to the applicable provisions of the State Merit System Law. Subject to any other applicable law regulating travel expenses, the officers and employes of the division shall be allowed such reasonable and necessary travel and other expenses as may be incurred in the performance of their duties.

(3) Require a fidelity bond of any officer or employe of the division who has charge of, handles or has access to any state money or property, and who is not otherwise required by law to give a bond. The amounts of the bonds shall be fixed by the commissioner, except as otherwise provided by law, and the sureties shall be approved by him. The division shall pay the premium on the bonds.

[1963 c.580 §42]

696.400 [Repealed by 1963 c.580 §103]

696.405 Real Estate Board; appointment; term; qualifications; compensation; expenses. (1) The Real Estate Board is established within the Department of Commerce. The board shall consist of five members, one of whom shall be the Real Estate Commissioner, and the other four members shall be appointed by the Director of Commerce with the approval of the Governor to hold office for a period of four years, but to serve at the pleasure of the Director of Commerce. The members of the board must have been, before the date of their appointment, for five years real estate brokers actively engaged in business as such in this state or actively connected with the administration of the Real Estate Division or its predecessor, the Oregon Real Estate Department. In case of a vacancy for any cause the Director of Commerce, with the approval of the Governor, shall make an appointment to become immediately effective for the unexpired term.

(2) A member of the Real Estate Board is entitled to compensation or expenses as provided in ORS 292.495.

[1963 c.580 §43; 1969 c.314 §97]

696.410 [Repealed by 1963 c.580 §103]

696.415 Officers; meetings; quorum. (1) The Real Estate Board shall annually select one of its members as chairman, who shall preside at the meetings of the board. In the absence of the chairman some other member of the board may serve as chairman. The board shall meet at such times and places as determined by the board and may also meet upon call of the chairman.

(2) A majority of the board shall constitute a quorum for the transaction of business. A vacancy on the board shall not impair the right of the remaining members to

perform all the duties and exercise all the functions and authority of the board.
[1963 c.580 §45]

696.420 [Repealed by 1963 c.580 §103]

696.425 Powers and duties of board. (1) The Real Estate Board is authorized to inquire into the needs of the real estate licensees of Oregon, the functions of the Real Estate Division and the matter of the business policy thereof, to confer with and advise the Director of Commerce as to how the division may best serve the state and the licensees, and to make recommendations and suggestions of policy to the Real Estate Division as the board may deem beneficial and proper for the welfare and progress of the licensees and of the public and of the real estate business in Oregon.

(2) The board shall conduct all examinations for applicants for both broker's and salesman's licenses, prepare or cause to be prepared the questions to be asked in the examinations and grade or cause to be graded the papers of each applicant after the completion of the examination and file a written report with the Real Estate Division as to applicants taking the examination who have passed and who have failed to pass the examination. The board shall provide the manner and methods for conducting examinations.

(3) The expenses of the Real Estate Board shall be paid from moneys available to the Real Estate Division for payment of administrative expenses relating to the real estate and business broker activities of the division.
[1963 c.580 §46; 1969 c.674 §19]

696.430 Records of commissioner as evidence; records open to inspection. Copies of all records and papers in the office of the commissioner duly certified and authenticated by the seal of the commissioner shall be received in evidence in all courts equally and with like effect as the original. All records kept in the office of the commissioner under authority of ORS 696.010 to 696.490 and 696.610 to 696.730 shall be open to public inspection under such reasonable rules and regulations as shall be prescribed by the commissioner.

696.435 Printed matter to be furnished licensees. Single copies of matter printed and circulated as authorized by ORS 696.385, except replacement pages or parts therefor, may be furnished free of charge to each licensee. Additional copies and any replacement pages or parts furnished to licensees or any copy furnished to any other person, except one required by law to be furnished, are to be sold for a charge set by the commissioner. The charge is to be set at a level reasonably estimated to be sufficient to recover the cost of printing and distributing copies to be sold.
[1963 c.546 §5; 1965 c.617 §6]

696.440 [Repealed by 1963 c.580 §103]

696.450 [Repealed by 1963 c.580 §103]

696.460 [Repealed by 1963 c.580 §103]

696.470 [Repealed by 1963 c.580 §103]

696.480 Publication of directory by commissioner. (1) The commissioner shall, at least annually, publish a directory or a list of the names and addresses of all currently licensed brokers and salesmen and all applicants whose licenses have been refused, and licensees whose licenses have been suspended or revoked within one year, a copy of the provisions of ORS 696.010 to 696.375, 696.395 to 696.490, 696.710 to 696.730 and 696.990, the code of ethics as adopted by the National Association of Real Estate Boards and a list of all local real estate boards, their officers and directors.

(2) The directory shall contain a financial statement of the receipts and disbursements of the department for the previous fiscal year and shall also contain a general report of its activities. One such directory shall be mailed without charge to each licensed broker. One such directory shall be mailed to the county clerk in each county of the state and shall be held by the county clerk as a public record. One directory also shall be mailed to the district attorney in each county of the state for his files, and one copy shall be mailed or furnished to any person upon request and the payment of $1 therefor except that copies requested may be furnished without charge to any state department.

696.490 Disposition of receipts; Real Estate Educational Account. (1) Except as provided in subsection (2) of this section, the net amount of all fees and charges collected under this chapter shall be paid by the division, at least once each month, into the State Treasury and after deduction of refunds be deposited to the credit of the General Fund and become available for general governmental expenses.

(2) All charges collected pursuant to

ORS 696.435 and one-fourth of the amount of each license fee collected under subsections (2), (3), (4), (5) and (15) of ORS 696.270 shall be deposited by the division in the General Fund in the State Treasury to the credit of an account to be known as the Real Estate Educational Account. The moneys in the Real Estate Educational Account hereby are appropriated continuously to the division, and may be expended by the division for the purpose of advancing education and research in real estate, including distributing printed matter of an educational nature, and conducting educational meetings for the benefit of licensed real estate brokers and salesmen.

[Amended by 1955 c.457 §2; 1961 c.309 §4; 1963 c.440 §16; 1963 c.580 §50; 1965 c.617 §7]

696.500 [Amended by 1959 c.27 §1; repealed by 1961 c.309 §5]

ESCROWS AND ESCROW AGENTS

696.505 Definitions for ORS 696.505 to 696.580. As used in ORS 696.505 to 696.580, unless the context requires otherwise:

(1) "Commissioner" means the Real Estate Commissioner.

(2) "Escrow" means any transaction wherein any written instrument, money, evidence of title to real or personal property or other thing of value is delivered to a person not otherwise having any right, title or interest therein for the purpose of effecting the sale, transfer, encumbrance or lease of real or personal property, to be held by that person until the happening of a specified event or the performance of a prescribed condition, when it is then to be delivered by such person to a grantee, grantor, promisee, promisor, obligee, obligor, bailee, bailor, or any agent or employe of any of them.

(3) "Escrow agent" means any person engaged in the business of receiving escrows for deposit or delivery for compensation.

[1963 c.440 §1]

696.510 [Repealed by 1961 c.309 §6]

696.511 License required; application; issuance. (1) No person shall engage in or carry on, or hold himself out as engaging in or carrying on the business or act in the capacity of an escrow agent without first obtaining a license as an escrow agent under the provisions of ORS 696.505 to 696.580.

(2) Every escrow agency before engaging in the escrow business shall file in the office of the commissioner an application for a license, in writing, verified by oath and in the form prescribed by the commissioner. It shall state the location of the agent's principal office and all branch offices in this state, the name or style of doing business, the names, resident and business addresses of all persons interested in the business as principals, partners, officers, trustees and directors, specifying as to each his capacity and title, the general plan and character of business and the length of time the agent has been engaged in business.

(3) The commissioner may require additional information he considers necessary in connection with any application for a license under this section.

(4) The commissioner shall examine the application for a license and if he is satisfied that the applicant should not be refused a license under ORS 696.535, he shall issue the license.

(5) No person shall engage in business as an escrow agent without holding a license required by ORS 696.505 to 696.580.

[1963 c.440 §§4, 17]

696.515 Foreign corporations required to have certificate of authority to act as escrow agents. No foreign corporation without a valid certificate of authority under ORS 57.655 to 57.745 shall transact any escrow business in this state.

[1963 c.440 §3]

696.520 Application of ORS 696.505 to 696.580. The provisions of ORS 696.505 to 696.580 do not apply to and the term "escrow agent" does not include:

(1) Any person doing business under the laws of this state or the United States relating to banks, mutual savings banks, trust companies, savings and loan associations, common and consumer finance companies, industrial loan companies, or insurance companies.

(2) An attorney at law rendering services in the performance of his duties as attorney at law.

(3) Any person whose principal business is that of preparing abstracts or making searches of title which are used as a basis for the insurance of titles by a title insurance company authorized to do business in this state.

(4) Any firm or corporation lending money on real or personal property and which firm or corporation is subject to licensing, supervision or auditing by a federal or state agency.

(5) Any person doing any of the acts specified in subsection (2) of ORS 696.505 under order of any court.
[1963 c.440 §2; 1967 c.359 §701]

696.525 Bond for escrow agents. (1) At the time of filing an application for an escrow agent's license, the applicant shall deposit with the commissioner a corporate surety bond running to the State of Oregon, executed by a surety company satisfactory to the commissioner, in the sum of $25,000, the provisions to be in the form substantially as follows:

Know All Men by These Presents, That we, ———————— as principal, and ————————, a corporation, qualified and authorized to do business in the State of Oregon as surety, are held and firmly bound unto the State of Oregon for the use and benefit of any interested person, in the sum of $25,000, lawful money of the United States of America, to be paid to the State of Oregon for the use and benefit aforesaid, for which payment well and truly to be made, we bind ourselves, our heirs, executors, administrators, successors, and assigns, jointly and severally, firmly by these presents.

The condition of the above obligation is such that: Whereas the above-named principal has made application to the Real Estate Commissioner of the State of Oregon for registration as an escrow agent within the meaning of ORS 696.505 to 696.580 and is required by the provisions of ORS 696.505 to 696.580 to furnish a bond in the sum above named, conditioned as herein set forth:

Now, therefore, if the principal, his agents and employes, shall strictly, honestly and faithfully comply with the provisions of ORS 696.505 to 696.580, and shall pay all damages suffered by any person by reason of the violation of any of the provisions of ORS 696.505 to 696.580, now or hereafter enacted, or by reason of any fraud, dishonesty, misrepresentation or concealment of material facts growing out of any transaction governed by the provisions of ORS 696.505 to 696.580, then this obligation shall be void; otherwise to remain in full force and effect.

This bond shall become effective on the———— day of————————, 19——, and shall remain in force until the surety is released from liability by the Real Estate Commissioner, or until this bond is canceled by the surety. The surety may cancel this bond and be relieved of further liability hereunder by giving 30 days' written notice to the principal and to the Real Estate Commissioner of the State of Oregon.

This bond shall be one continuing obligation, and the liability of the surety for the aggregate of any and all claims which may arise hereunder shall in no event exceed the amount of the penalty hereof.

In witness whereof, the seal and signature of the principal hereto is affixed, and the corporate seal and the name of the surety hereto is affixed and attested by its duly authorized officers at ————————, Oregon, this —— day of————————, 19——.

Surety

By————————————

---

(2) The commissioner may at any time require an escrow agent to deposit with the commissioner an additional bond when in the commissioner's opinion any bond then in force is insufficient to protect the public interest.
[1963 c.440 §5]

696.530 Renewal of license; fees. (1) The escrow agent's license shall expire June 30 next after the date of issuance if it is not renewed by July 1 of such year. A license may be renewed by filing a renewal application, submitting a satisfactory independent audit by a certified public accountant and paying the annual license fee for the next succeeding fiscal year.

(2) The filing fees shall be:

(a) For filing an original or a renewal application, $100 for the principal office and $35 for each branch office.

(b) For filing an application for a duplicate copy of any license, upon satisfactory showing of such loss, $10.
[1963 c.440 §6]

696.535 Refusal, suspension or revocation of licenses; records and reports. (1) The commissioner may refuse to license any escrow agent, or may suspend any license, by entering an order to that effect, with his findings in respect thereto, if upon examination into the affairs of the applicant or licensee, either in the performance of routine duties, or upon field examination, or upon hearing, it is determined that the applicant or licensee:

(a) Is insolvent; or

8245

(b) Is of bad business repute or has demonstrated his unworthiness to transact the business of agent; or

(c) Does not conduct his business in accordance with law, or has violated any provisions of ORS 696.505 to 696.580; or

(d) Is in such financial condition that he cannot continue in business with safety to his customers; or

(e) Has been guilty of fraud in connection with any transaction governed by ORS 696.505 to 696.580; or

(f) Has made any misrepresentations or false statement to, or concealed any essential or material fact from, any person in the course of the escrow business; or

(g) Has knowingly made or caused to be made to the commissioner any false representation of a material fact, or has suppressed or withheld from the commissioner any information which the applicant or licensee possesses, and which if submitted by him would have rendered the applicant or licensee incompetent to be licensed under ORS 696.505 to 696.580; or

(h) Has failed to account to persons interested for all escrows received; or

(i) Has not delivered, after a reasonable time, to persons entitled thereto, escrows held or agreed to be delivered by the licensee, as and when paid for and due to be delivered; or

(j) Has refused to permit an examination by the commissioner of his books and affairs, or has refused or failed, within a reasonable time, to furnish any information or make any report that may be required by the commissioner under the provisions of ORS 696.505 to 696.580; or

(k) Has been convicted of a felony or any misdemeanor of which an essential is fraud.

(2) It is sufficient cause for refusal or revocation of a license in case of a partnership or corporation or any unincorporated association, if any member of a partnership or any officer or director of the corporation or association has been guilty of any act or omission which would be cause for refusing or revoking the registration of an individual agent.

(3) All escrow agents shall keep and maintain at all times in their principal places of business, complete and suitable records of all escrow transactions made by them, together with books, papers and data clearly reflecting the financial condition of the business of such agents. Every agent shall, at the times required by the commissioner, make and file in the office of the commissioner a true and correct statement, in the form and containing the data the commissioner may require, of the business of the agent.

(4) Notice of the entry of any order of suspension or of refusing a license to any agent shall be given in writing, served personally or sent by certified mail or by telegraph to the agent affected. The agent shall, upon application, be entitled to a hearing; but if no such application is made within 20 days after the entry of an order of suspension or of refusing a license of any agent, the commissioner shall enter a final order in either case.

[1963 c.440 §7]

696.540 Authority of Real Estate Commissioner over escrow agents. (1) The commissioner shall have general supervision and control over all escrow agents residing in and doing business in this state. Subject to ORS chapter 183, the commissioner may adopt such rules and regulations as are reasonable and necessary for the enforcement of ORS 696.505 to 696.580. All such agents shall be subject to examination by the commissioner, or his authorized deputies, at any time he considers advisable. The provisions of this section and any other section relating to the examination of the affairs of an agent shall extend to an agent whose license has expired or been revoked or suspended, if in the judgment of the commissioner, such agent has violated any condition of his license or any provision of ORS 696.505 to 696.580 or has committed a fraud or is insolvent. The commissioner may collect from each agent the actual expenses incurred in that examination.

(2) No person shall neglect or refuse to attend and testify or answer any lawful inquiry or to produce books, papers, accounts, records, contracts or documents, if in his power so to do, in obedience to the subpena of the commissioner.

[1963 c.440 §8]

696.545 Investigation; injunction; jurisdiction. (1) The commissioner may investigate either upon complaint or otherwise whenever it appears that an escrow agent is

conducting his business in an unsafe and injurious manner or that any person is engaging in the escrow business without being licensed under the provisions of ORS 696.505 to 696.580.

(2) If upon investigation it appears that such agent is so conducting his business or an unlicensed person is engaged in the escrow business the commissioner may, in addition to any other remedies, bring suit in the name and on behalf of the State of Oregon against such person and any other person or persons concerned in or in any way participating in or about to participate in such unsafe or injurious practices or acting in violation of ORS 696.505 to 696.580, to enjoin such person and such other person or persons from continuing such practices or engaging therein or doing any act or acts in furtherance thereof or in violation of ORS 696.505 to 696.580.

(3) The circuit court of any county of this state hereby is vested with jurisdiction in equity to restrain unsafe, injurious or illegal practice or transactions and may grant injunctions to prevent and restrain such illegal practices or transactions, in addition to the penalties and other remedies provided in ORS 696.505 to 696.580. The court shall have power, during the pendency of the proceedings before it to issue such preliminary restraining orders as may appear to be just and proper; and the findings of the commissioner shall be deemed to be prima facie evidence and sufficient ground, in the discretion of the court, for the issue ex parte of a preliminary restraining order.

(4) In any such court proceedings the commissioner may apply for and on due showing be entitled to have issued the court's subpena requiring forthwith the appearance of any defendant and his employes and the production of documents, books and records as may appear necessary for the hearing of such petition, to testify and give evidence concerning the acts or conduct or things complained of in such application for injunction.
[1963 c.440 §9]

696.550 Appeal procedure. (1) An appeal may be taken by any person interested from any final order of the commissioner to the circuit court of Marion County by serving upon the commissioner within 20 days after notice of the entry of the order a written notice of the appeal, stating the grounds upon which a reversal of the final order is sought and accompanied by a demand in writing for a certified transcript of the record and of all papers on file in his office affecting or relating to the order and by executing a bond in the penal sum of $500 to the State of Oregon, with sufficient surety, to be approved by the court, conditioned upon the faithful prosecution of the appeal to final judgment and the payment of all costs adjudged against the appellant. Thereupon the commissioner shall within 10 days make, certify and deliver to the appellant the transcript, or in lieu thereof the original papers if the court so orders. The appellant shall within five days thereafter file the same and a copy of the notice of appeal with the clerk of the court, which notice of appeal shall stand as appellant's complaint. Thereupon the cause shall be entered on the trial calendar of the court for trial de novo and shall be given precedence by the court over other matters pending. The court shall receive and consider any pertinent evidence, oral or documentary, concerning the order of the commissioner from whom the appeal is taken.

(2) If the order of the commissioner is reversed the court shall by its mandate specifically direct the commissioner as to his further action in the matter, including the making and entering of any order in connection therewith, and the conditions, limitations or restrictions to be therein contained, provided that the commissioner shall not thereby be barred from thereafter revoking or altering the order for any proper cause which may thereafter accrue or be discovered. If the order is affirmed, the appellant shall not be barred after 30 days from filing a new application provided the application is not otherwise barred or limited. The appeal shall not in anywise suspend the operation of the order appealed from during the pendency of the appeal unless upon proper order of the court. An appeal may be taken from the judgment of the circuit court on any such appeal on the same terms and conditions as an appeal is taken in civil actions. An appeal from an order of the commissioner shall be considered as a proceeding in equity. Any order of the commissioner which finally limits, or adversely determines, the rights of any interested person, shall be a final order as to such interested person, and be subject to appeal under this section and ORS 696.555.
[1963 c.440 §10(1), (2)]

696.555 Commissioner to take possession of property and assets of escrow agent when assets or capital impaired; receiver may be appointed. (1) When the commissioner ascertains by examination or otherwise that the assets or capital of any agent are impaired, or that the agent's affairs are in an unsafe condition, he may in either case immediately take possession of all the property, business and assets of the agent which are located in this state and retain possession of them pending the further proceedings specified in this section and ORS 696.550. Should the board of directors or any officer or person in charge of the offices of such agent refuse to permit the commissioner to take possession as aforesaid, the commissioner shall communicate such fact to the Attorney General, whereupon it shall become the duty of the Attorney General at once to institute such proceedings as may be necessary to place the commissioner in immediate possession of the property of the agent. The commissioner thereupon shall make or have made an inventory of the assets and known liabilities of the agent. The commissioner shall file one copy of the inventory in his office and one copy in the office of the clerk of the circuit court of the county in which the principal office of the agent is located, and shall mail one copy to each stockholder of the agent at his last-known address, if by the exercise of reasonable diligence it can be determined. The clerk of the court with whom the copy of the inventory is filed shall file it as any other case or proceeding pending in the court and shall give it a docket number.

(2) The officers, directors or stockholders of the agent may have 60 days from the date when the commissioner takes possession of the property, business and assets, to make good any deficit which may exist or to remedy the unsafe condition of its affairs. At the expiration of this time, if the deficiency in assets or capital has not been made good or the unsafe condition remedied, the commissioner may apply to the court to be appointed receiver and proceed to liquidate the assets of the agent which are located in this state in the same manner as now provided by law for liquidation of a private corporation in receivership. No other individual shall be appointed receiver by any court without first giving the commissioner ample notice thereof. The inventory made by the commissioner and all claims filed by creditors shall be open at all reasonable times for inspection and any action taken by the receiver upon any of the claims shall be subject to the approval of the court before whom the cause is pending. The expenses of the receiver and compensation of counsel, as well as all expenditures required in the liquidation proceedings, shall be fixed by the commissioner, subject to the approval of the court, and, upon certification of the commissioner, shall be paid out of the funds in his hands as such receiver.
[1963 c.440 §10(3),(4)]

696.560 Deposit and designation of money held in escrow. All money deposited in escrow to be delivered upon the close of the escrow or upon any other contingency shall be deposited in a bank and kept separate, distinct and apart from funds belonging to the escrow agent. Such funds, when deposited, are to be designated as "trust funds," "escrow accounts," or under some other appropriate name indicating that the funds are not the funds of the escrow agent.
[1963 c.440 §11]

696.565 Funds exempt from execution or attachment; designation of funds. (1) Escrow or trust funds are not subject to execution or attachment on any claim against the escrow agent.

(2) No person shall knowingly keep or cause to be kept any funds or money in any bank under the heading of "trust funds" or "escrow accounts" or any other name designating such funds or money as belonging to the clients of any escrow agency, except actual escrow or trust funds deposited with such agency.
[1963 c.440 §12]

696.570 Hearings procedure under ORS 696.505 to 696.580; subpena; witness fees; depositions. (1) All hearings before the commissioner or his authorized representative conducted under the authority of ORS 696.505 to 696.580 shall be conducted in accordance with the provisions of ORS chapter 183 and such rules and regulations made in conformity therewith as the commissioner shall consider necessary.

(2) The commissioner, or anyone authorized by him, shall have the power to subpena witnesses and administer oaths in connection with the administration of ORS 696.505 to 690.580. Each witness who appears before the commissioner and who was subpenaed in his behalf shall receive for his attendance

the fees and mileage provided for witnesses in civil cases in the court of record in the county where the hearing is held. The commissioner or any party may, in any investigation, cause the depositions of witnesses residing within or without the state to be taken in the manner prescribed for depositions in civil actions in circuit courts.
[1963 c.440 §13]

696.575 Civil or criminal actions not limited by ORS 696.505 to 696.580. Nothing in ORS 696.505 to 696.580 shall limit any statutory or common law right of any person to bring any action in any court for any act involved in the transaction of the escrow business or the right of the state to punish any person for any violation of any law.
[1963 c.440 §14]

696.580 Documents filed with commissioner as public records; exception. All papers, documents, reports and other written instruments filed with the commissioner under ORS 696.505 to 696.580 shall be open to public inspection, except that the commissioner may withhold from public inspection for such time as he considers necessary any information which in his judgment the public welfare or the welfare of any escrow agent requires to be so withheld.
[1963 c.440 §15]

BUSINESS CHANCE BROKERS

696.610 "Business chance broker" defined. As used in this chapter, "business chance broker" means and includes all persons, firms, corporations and associations that engage directly or indirectly in the business of buying, selling or dealing in any established business or business opportunity or good will or any interest therein, or who, for profit, compensation or commission engage in the business of offering to establish others in business or who declare to the public that they are engaged in the business of buying, selling or dealing in established businesses or business opportunities.

696.620 Real estate broker's or salesman's license required. No person shall engage in the business of a business chance broker without having a real estate broker's license or a real estate salesman's license as provided in this chapter.

696.630 Powers and duties of commissioner in relation to business chance brokers. The Real Estate Commissioner shall enforce the provisions of ORS 696.610 to 696.640, and he shall have full power to issue, deny, suspend and revoke licenses in the manner and under the terms and conditions as provided in ORS 696.010 to 696.490 and 696.610 to 696.730.

696.640 Law applicable to business chance brokers. Any person who engages in the business of a business chance broker is bound by and subject to all the provisions of ORS 696.010 to 696.490 and 696.610 to 696.730, except subsection (2) of ORS 696.110.

ACTIONS AND REMEDIES

696.710 Necessity of alleging license in action to collect compensation. No person engaged in the business of, or acting in the capacity of, a real estate broker within this state shall bring or maintain any action in the courts for the collection of compensation without alleging and proving that such person was a duly licensed real estate broker at the time the alleged cause of action arose.

696.720 Remedies are concurrent. The remedies provided for in ORS 696.010 to 696.490 and 696.610 to 696.730 are in addition to and not exclusive of any other remedies provided by law.

696.730 Jurisdiction of courts for violations; revoking license upon conviction. Any court of competent jurisdiction, including justices of the peace, has full power to try any violation of ORS 696.010 to 696.490 and 696.610 to 696.730, and, upon conviction, the court may, at its discretion and in addition to the other penalties imposed, revoke the license of the person or persons convicted.

PENALTIES

696.990 Penalties. (1) Violation of any provision of ORS 696.010 to 696.165, 696.180 to 696.226, 696.240 to 696.375, 696.395 to 696.490 and 696.610 to 696.730 is punishable, upon conviction of a first violation thereof, by a fine of not less than $200 nor more than $500 or by imprisonment for a term not to exceed 90 days, or by both, and, upon conviction of a second or subsequent violation, by a fine of not less than $500 nor more than $1,000 or by imprisonment for a term not to exceed two years, or by both.

(2) Any officer or agent of a corporation, or member or agent of a partnership or association, who personally participates in or is an accessory to any violation of ORS 696.010 to 696.165, 696.180 to 696.226 696.240 to 696.375, 696.395 to 696.490 and 696.610 to 696.730 by the partnership, association or corporation, is subject to the penalties prescribed in subsection (1) of this section.

(3) A violation of any one of the provisions of 696.505 to 696.580 is a misdemeanor.

REAL ESTATE DIVISION

[ED. NOTE: Unless otherwise specified, Sections 10-010 through 10-125 of this Chapter of the Oregon Administrative Rules Compilation were adopted by the Real Estate Board July 20, 1959, and filed with the Secretary of State, August 27, 1959 as Administrative Order REC 10.]

Statutory Authority: ORS 696.385 (3) and ORS 696.240

Real Estate Brokers and Salesmen

10-010 Advertising. (1) A broker shall not advertise by liner advertisements, or otherwise, to sell, buy, exchange, rent or lease property in a manner indicating that the offer to sell, buy, exchange, rent or lease such property is being made by a private party not engaged in the business of a real estate broker, except as provided in subsection (3).

(2) All advertising must be under the direct supervision and in the name of the employer-broker on all display signs as well as other types of advertising and the name of the broker must be prominently displayed and the name of the salesman must not be featured. Every salesman is prohibited from advertising under his own name.

(3) The advertising for rent of licensee owned property is exempted from the provisions of (1) and (2) above.

Hist: Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-015 Listings. (1) A broker or salesman who obtains a listing shall, at the time of securing such listing, give the person or persons signing such listing a true, legible carbon copy thereof.

(2) Every listing agreement, exclusive or non-exclusive, shall state a definite expiration date; it shall contain no provision requiring the party signing the listing to notify the broker of his intention to cancel the listing after such definite expiration date; it shall contain no provision which would subject the owner of the property to the payment of two commissions for one sale in the event the owner lists the same property with a second or subsequent broker after the termination of the first or preceding listing.

(3) No broker or salesman shall conspire with anyone to deprive an original listing broker of a commission, utilizing the restrictions of sub-paragraph (2) above.

Hist: Filed 5-5-65 as REC 20. Eff.: 7-1-65

10-020 Offers to Purchase. A broker or salesman shall promptly tender to the seller every written offer to purchase obtained on the property involved and, upon obtaining a proper acceptance of the offer to purchase, shall promptly deliver true executed copies of same, signed by the seller and purchaser, to both purchaser and seller; all brokers and salesmen shall make certain that all of the terms and conditions of the real estate transaction are included in the offer to purchase, especially that portion referring to evidence of title or absence of the requirement thereof, should that right have been waived by the prospective purchaser. An earnest money receipt, when signed by the prospective purchaser, shall be deemed in all respects, an offer to purchase.

10-025 Deposits. (1) All moneys of whatever kind and nature pertaining to real estate transactions as defined in ORS 696.010 belonging to others and accepted by the broker while acting in his capacity as a broker, shall be deposited in a neutral escrow depository or in a separate bank account to be entitled CLIENT'S TRUST ACCOUNT, maintained by the broker as a depository for clients' funds and shall be retained in this bank account until the transaction involved is consummated or terminated, at which time the broker shall account for the full amounts received. However, a broker, in his discretion, may pay to any seller or to the seller's authorized agent, the whole or any portion of such special deposits provided that such broker shall, nevertheless, be held personally responsible for such deposits at all times.

(2) Every salesman shall, promptly upon receipt by him of any money on any transaction in which he is engaged on behalf of his employer broker, pay over the amount to his employer.

(3) Under no circumstances shall a broker permit any advance payment of funds belonging to others to be deposited in the broker's personal account or be commingled with funds he may have on deposit.

(4) Every deposit made in accordance with the provisions of ORS 696.240, shall be made with a deposit slip which will identify each transaction. This deposit slip shall state in addition to the amount of the deposit, the names of all parties involved in the transaction.

(5) A complete record must be maintained in the broker's office of all moneys received on all real estate transactions. This record shall show from whom the money was received, the date of the receipt, the place of deposit, and the date it was deposited, and when the deal has been completed the final disposition of the funds.

(6) All earnest money deposits wherein a broker or salesman has a purchaser's interest, shall be placed in a neutral escrow in this state.

(7) The Commissioner shall be provided upon his request continuing authorization to verify the actual balance in any "CLIENT'S TRUST ACCOUNT". Such authorization to be placed on file with the bank in which the acount is maintained.

Hist: Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-030 Closing Statements. (1) In any real estate transaction where he acts as a real estate broker, any broker shall deliver to the seller at the time the transaction is consummated, a complete detailed closing statement showing all of the receipts and disbursements handled by him.

(2) He shall also deliver to the buyer a complete statement showing all moneys received in the transaction from the buyer and how they were disbursed.

(3) The broker shall retain true copies of these statements in his file including evidence of delivery.

Hist: Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-035 Earnest Money. The type of earnest money received in any real estate transaction, whether it be cash, check or promissory note, shall be specifically stated in the earnest money receipt.

10-040 Method of Filing. All real estate deals or transactions shall be numbered consecutively. All listing agreements and all earnest money receipts shall be approved in writing on the document by the broker within five (5) days of the date thereof. The above documents shall be kept in the main office and copies thereof may be retained in the branch office.

Hist: Filed 4-11-63 as REC 18

10-043 Brokers. A broker shall not permit the use of his license to enable salesmen licensed through him to in fact establish and carry on a real estate brokerage business wherein the brokers only interest is the receipt of a fee for use of his license by others, the broker having no or only nominal control of the affairs of the business conducted under his license.

Hist: Filed 3-1-63 as REC 17

10-045 Broker's Personal Interest. (1) A broker shall not either directly or indirectly buy for himself, property listed with him or as to which he has been approached by the owner to act as broker, nor shall he acquire interest in any other property therein either directly or indirectly, without first making his true position clearly known to the owner. Satisfactory written proof of this fact must be produced by the broker upon request of the Commissioner.

(2) A broker shall not take an option to himself, either directly or indirectly, upon property for the sale of which he has been approached by the owner to act as a broker, without first making his true position clearly known that he is now acting as a prospective buyer and is no longer acting as a broker or agent for the owner. Satisfactory proof of this must be produced by the broker upon request of the Commissioner.

(3) A salesman shall not buy for himself, either directly or indirectly, property listed with his employer-broker, nor shall he acquire interest in any other property, either directly or indirectly, without first making his true position clearly known to the owner, nor shall he take an option unto himself from any such owner or to anyone on his behalf upon any property without first making his position known. Satisfactory written proof of these facts must be produced by the salesman on request of the Commissioner.

Hist: Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-050 Associate Real Estate Brokers. The contract provided for in ORS 696.165 as a prerequisite for a broker to have his license transferred to that of an associate broker shall read substantially as follows:

Agreement For Associate Broker

_____, Oregon _____, 19____.

For and in consideration of the issuance to me of a license as an Associate Real Estate Broker by the Real Estate Commissioner of the State of Oregon, I do hereby undertake and agree that I will not, during the time that I retain my license as an Associate Real Estate Broker, engage in any act or acts whatsoever in the capacity of a Broker other than as an employe of my employing broker. This agreement is executed in conformance with ORS 696.165, and is for the benefit of my employing broker.

10-055 Salesmen. Every salesman shall be licensed under a broker; he cannot be licensed with more than one broker during the same period of time. A salesman shall not commence work until he receives a pocket card from his employer-broker, either an original application or transfer. Brokers and salesman shall carry their pocket cards with them at all times. Duplicate cards will be issued upon submission of satisfactory proof of the loss of the originals. Immediately on the issuance of a duplicate card the original shall cease to have any effect.

10-060 Salesman Closing. A salesman shall not handle the closing of any real estate transaction (unless authorized by his employer-broker) except under the direct supervision of the broker, a licensed officer, or a licensed partner of the corporation or partnership under whom the salesman is licensed. Authorization of a salesman to make closing must be in writing, and a copy of the authorization bearing the employer-broker's signature must be filed with the Real Estate Division.

Hist: Filed 8-5-64 as REC 19

10-065 Application for Real Estate License: (1) Any person desiring to take an examination for real estate broker or salesman must file with the Real Estate Division a completed application together with the application fee no later than the fifteenth day of the month immediately preceding the month in which the examination is scheduled.

(2) In addition to that information and those documents required by ORS 696, every applicant shall as an integral part of the completed application furnish at his own expense a current credit report from an established credit reporting agency acceptable to the Real Estate Commissioner.

Hist: Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-070 Assumed Business Names. (1) A broker shall not conduct his business under any name other

than the one in which his license is issued. A broker desiring to operate under an assumed name shall forward a copy of the registration of assumed name furnished and verified by the Corporation Commissioner to the Real Estate Commissioner with his application for a broker's license and said name shall be shown on the broker's license and pocket card.

(2) An "Assumed Business Name" of a real estate broker may not contain as part of that name the surname of a real estate salesman licensed with that broker. The name of a corporation, partnership or association may not contain as part of that name, the surname of a real estate salesman licensed with that corporation, partnership or association. The Commissioner may, at his discretion, however, allow the use of such surname where the circumstances are unusual or coincidental.

(3) Use of an "Assumed Business Name" which is misleading or is the name of a person whose license has been suspended or revoked is grounds for refusal by the Commissioner to issue a license in such name.

Hist: Filed 8-5-64 as REC 19
Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-075 Branch Offices. Any additional office or places of business other than the principal place of business of a broker shall be licensed only with the approval of the Real Estate Commissioner after the broker has given satisfactory proof that his additional place of business will be so located as to receive the broker's personal supervision or that it will be under the supervision of the duly licensed salesman or associate broker of the broker, approved by the Commissioner. Every such office will be designated as a BRANCH OFFICE by an appropriate sign displayed in the manner provided for signs in ORS 696.200.

10-080 [Repealed 8-5-64 by REC 19]

10-085 Licenses and Licensees. (1) A broker or salesman, upon surrendering his license or upon notice of suspension or revocation of his license, shall forward the license, together with his pocket card, at once to the Commissioner. A broker shall also forward to the Commissioner with his broker's license and pocket card all salesman's licenses and pocket cards in his possession or in his office and shall be responsible for all missing licenses of his salesmen. No refund will be made upon licenses when surrendered, suspended or revoked.

(2) At the time of renewing his license, a broker or salesman who does not intend to perform any of the acts as defined in ORS 696.010, may renew his license on an inactive basis. The fee of $7.50 for an inactive salesman's license or the fee of $10.00 for an inactive broker's license shall accompany the application.

(3) To reactivate an inactive license, the salesman's license fee of $15.00 or the broker's license fee of $25.00 must be submitted with the application, and no credit for fees previously paid will be allowed.

(4) A broker or salesman who has renewed his license as inactive or who surrendered his active license during the fiscal year and has applied for an inactive license, must, in order to remain in good standing, pay the annual renewal fee each year that the license is inactive.

(5) It is unlawful for any broker or salesman who holds an inactive license to perform any acts defined in ORS 696.010.

(6) Any real estate broker, associate broker or real estate salesman whose license has not been renewed for a period exceeding one year shall not be eligible for renewal of such license without again submitting to the real estate examination for such license.

(7) Any person who has passed the examination for real estate broker or real estate salesman, must become licensed within one year from the date of such examination in order to become eligible for such license. Failure to comply with this provision will necessitate the submission to and passing of another examination.

Hist: Filed 7-5-67 as REC 21
Amended 7-3-69 by REC 23. Eff.: 9-1-69

10-090 Attorneys. A broker should not discourage any party to a real estate transaction from seeking the advice of an attorney.

10-095 Penalties. Any real estate broker or salesman who fails or neglects to abide by sections 10-010 to 10-115 shall be deemed prima facie, to be guilty of improper dealings, and may be subject to a hearing before the Commissioner.

10-100 Hearings. The Commissioner may refuse to accept jurisdiction of any dispute presented or complaint filed in his office not involving fraud on the part of a broker or salesman or may dismiss any such matter without prejudice at any stage of the proceeding when it develops or appears that the complaining party or other disputes may obtain adequate relief through the courts. In any case in which a broker is charged with fraud or the improper handling of money, and where the Commissioner becomes satisfied that there is no sufficient basis for such charge, the Commissioner may dismiss the matter, leaving the parties to their respective court remedies.

10-105 Recording to Hearings. At any hearing before the Commissioner as provided by ORS 696.330, the testimony of witnesses may be recorded by a mechanical, electrical or electronic device.

10-110 Amendments. These rules may be amended by the Oregon Real Estate Division at any time without notice; provided, however, that in the event of any such amendment, or in the event of the adoption by the Division of additional rules a copy shall be mailed by the Commissioner to each licensed broker within the state at his most recent address registered in the real estate division. Failure on the part of any licensee to receive any such copy shall be no defense.

Hist: Filed 8-5-64 as REC 19.

PROCEDURE

10-115 Rules of Procedure in Contested Cases. (1) The rules of procedure in contested cases of the Real

Estate Board (agency) shall be the Model Rules of Procedure as promulgated by the Attorney General of the State of Oregon and filed with the Secretary of State on October 3, 1959 with the exception of Rule 3A (3) (c) and Rule 3B (2) (b) which are a part of the model rules and are not adopted by this agency.

(2) The Division shall require an original and two copies of the petition provided for in Rule 3A (4) of the Model Rules.

(3) The Division shall require two copies of any amended petition provided for in Rule 3A (8) of the Model Rules.

Hist: Filed 8-5-64 as REC 19

10-120 Brokers and Salesmen: Every licensee shall, within ten days, notify the Real Estate Commissioner of any adverse decision of any court of competent jurisdiction as the result of any suit or judgment, civil or criminal, in which the licensee appeared as the defendant, and in which the subject matter involved any real estate or business-chance transaction to which he was a party.

Hist: Filed 7-3-69 as REC 23. Eff.: 9-1-69

10-125 Payment of Commission. Upon receipt by a real estate broker of an earned commission as a disbursement from his "CLIENT'S TRUST ACCOUNT" or from a neutral escrow account, he shall within a reasonable time pay to his salesman or salesmen, as the case may be, the agreed share or shares of such salesman's commission. Failure to so pay the salesman within 30 days after receipt of a commission by a broker shall be deemed prima facie evidence of violation of this section.

Hist: Filed 7-3-69 as REC 23. Eff.: 9-1-69

CODE OF ETHICS

NATIONAL ASSOCIATION OF REAL ESTATE BOARDS

Preamble

Under all is the land. Upon its wise utilization and widespread ownership depend the advancement of national well-being and the perpetuation of the free institutions that go to make the American way of life.

The Realtor has husbanded and developed the land resource of the nation and, with his help, ownership has attained its widest distribution—a distinguishing mark that differentiates this from other civilizations and provides the real safeguard against radical impenetrations.

The Realtor is a creator of homes, both urban and rural, and by his activities helps mold the form of his future community, not only in the living of its people, but in its commercial and industrial aspects.

Such functions impose obligations beyond those of ordinary business; they impose grave social responsibilities which the Realtor can meet only by diligent preparation and by dedicating himself as a civic duty to their fulfillment.

The Realtor therefore must be zealous to maintain and continually improve the professional standards of his calling. He shares with his fellow-Realtors a common responsibility for the integrity and honor of that calling. In the interpretation of his obligations, he can take no safer guide than that which has been handed down through twenty centuries, embodied in the Golden Rule, in substance:

"Whatsoever ye would that men should do to you, do ye even so to them."

Accepting this standard as his own, every Realtor pledges himself to observe its spirit in all his dealings and to conduct his business in acordance with the following Code of Ethics, adopted by the National Association of Real Estate Boards:

PART I

Relation to the Public

Article 1. The Realtor should keep himself informed as to movements affecting real estate in his community, state, and the nation, so that he may be able to contribute to public thinking on matters of taxation, legislation, land use, city planning, and other questions affecting property interests.

Article 2. It is the duty of the Realtor to be well informed on current market conditions in order to be in a position to advise his clients as to the fair market price.

Article 3. It is the duty of the Realtor to protect the public against fraud, misrepresentation or unethical practices in the real estate field.

He should endeavor to help stamp out or prevent arising in his community, any practices which could be damaging to the public or to the dignity and integrity of the real estate profession. If there be a board or commission in the state, charged with the duty of regulating the practices of brokers and salesmen, the Realtor should lend every help to such body, cooperate with it, and report violation of proper practice.

Article 4. The Realtor should ascertain all pertinent facts concerning every property for which he accepts the agency, so that he may fulfill his obligation to avoid error, exaggeration, misrepresentation, or concealment of pertinent facts.

Article 5. The Realtor should not be instrumental in introducing into a neighborhood a character of property or use which will clearly be detrimental to property values in that neighborhood.

Article 6. The Realtor should not be a party to the naming of a false consideration in a deed, unless it be the naming of an obviously nominal consideration.

Article 7. The Realtor should not engage in activities that constitute the practice of law and should recommend that title be examined and legal counsel be obtained when the interest of either party requires it.

Article 8. The Realtor should keep in a special bank account, separated from his own funds, monies coming into his hands in trust for other persons, such as escrows, trust funds, client's monies and other like items.

Article 9. The Realtor in his advertising should be especially careful to present a true picture and should not advertise without disclosing his name or his firm name, nor permit his salesmen to use individual names or telephone numbers, unless the salesman's connection with the Realtor is obvious in the advertisement.

Article 10. The Realtor, for the protection of all parties with whom he deals, should see that financial obligations and commitments regarding real estate transactions are in writing, expressing the exact agreement of the parties; and that copies of such agreements, at the time they are executed, are placed in the hands of all parties involved.

PART II

Relations to the Client

Article 11. In accepting employment as an agent, the Realtor pledges himself to protect and promote the interests of the client. This obligation of absolute fidelity to the client's interest is primary, and does not relieve the Realtor from the obligation of dealing fairly with all parties to the transaction.

Article 12. In justice to those who place their interests in his hands, the Realtor should endeavor always to be informed regarding the law, proposed legislation, legal orders issued and other essential facts and public policies which affect those interests.

Article 13. Since the Realtor is representing one or another party to a transaction, he should not ac-

cept compensation from more than one party without the full knowledge of all parties to the transaction.

Article 14. The Realtor should not acquire an interest in or buy for himself, his firm or any member thereof, or a corporation in which he has an interest, property listed with him, or his company or firm, without making his true position known to the listing owner. In selling property owned by him, or in which he has some ownership interest, the exact facts should be revealed to the purchaser.

Article 15. The exclusive listing of property should be urged and practiced by the Realtor as a means of preventing dissension and misunderstanding and of assuring better service to the owner.

Article 16. When acting as agent in the management of property, the Realtor should not accept any commission, rebate or profit on expenditures made for an owner, without the owner's knowledge and consent.

Article 17. The Realtor should charge for his services only such fees as are fair and reasonable, and in accordance with local practice in similar transactions.

Article 18. When asked to make a formal appraisal of real property, the Realtor should not render an opinion without careful and thorough analysis and interpretation of all factors affecting the value of the property. His counsel constitutes a professional service for which he should make a fair charge.

The Realtor should not undertake to make an appraisal or render an opinion of value on any proprty where he has a present or contemplated interest unless such interest is specifically disclosed in the appraisal report. Under no circumstances should he undertake to make a formal appraisal when his employment or fee is contingent upon the amount of his appraisal.

The Realtor should not undertake to make an appraisal that is outside the field of his experience unless he obtains the assistance of a Realtor or appraiser familiar with such types of property, or unless the facts are fully disclosed to the client.

Article 19. The Realtor should not submit or advertise property without authority and in any offering, the price quoted should not be other than that agreed upon with the owners as the offering price.

Article 20. In the event that more than one formal offer on a specific property is made before the owner has accepted a proposal, all written offers should be presented to the owner for his decision.

PART III

Relations to His Fellow-Realtor

Article 21. The Realtor should seek no unfair advantage over his fellow-Realtors and should willingly share with them the lessons of his experience and study.

Article 22. The Realtor should so conduct his business as to avoid controversies with his fellow-Realtors; but, in the event of a controversy between Realtors who are members of the same real estate board, such controversy should be submitted for arbitration in accordance with regulations of their board and not to a suit at law. The decisions in such arbitration should be accepted as final and binding.

Article 23. Controversies between Realtors who are not members of the same real estate board should be submitted to an arbitration board consisting of one arbitrator chosen by each Realtor from the real estate board to which he belongs. One other member, or a sufficient number of members to make an odd number, should be selected by the arbitrators thus chosen.

Article 24. When the Realtor is charged with unethical practice, he should voluntarily place all pertinent facts before the proper tribunal of the real estate board of which he is a member, for investigation and judgment.

Article 25. The Realtor should never publicly criticize a competitor, nor volunteer an opinion of a competitor's transaction. If his opinion is sought it should be rendered with strict professional integrity and courtesy.

Article 26. When the Realtor accepts a listing from another broker, the agency of the broker who offers the listing should be respected until it has expired and the property has come to the attention of the accepting Realtor from a different source, or until the owner, without solicitation, offers to list with the accepting Realtor unless contrary to the rules of the local real estate board; furthermore, such a listing should not be passed on to a third broker without the consent of the listing broker.

Article 27. The Realtor should cooperate with other Realtors on property listed, sharing commissions on an agreed basis. Negotiations concerning property listed exclusively with one Realtor should be carried on with the listing broker, not with the owner, except with the consent of the listing Realtor.

Article 28. The Realtor should not solicit the services of an employee or salesman in the organization of a fellow-Realtor without the knowledge of the employer.

Article 29. Signs giving notice of property for sale, rent, lease or exchange should not be placed on any property by more than one Realtor, and then only if authorized by the owner, except as the property is listed with and authorization given to more than one Realtor.

Article 30. In the best interest of society, of his associates and of his own business, the Realtor should be loyal to the real estate board of his community and active in its work.

Conclusion

The term Realtor has come to connote competence, fair dealing and high integrity resulting from adherence to a lofty ideal of moral conduct in business relations. No inducement of profit and no instructions from clients ever can justify departure from this ideal, or from the injunctions of this Code.

ABSTRACT - Developed by the Bureau of Curriculum Development in cooperation with the Bureau of Trade and Technical Education of the New York City Board of Education, this curriculum guide is for instructor use in an experimental airframe maintenance technician program in vocational and technical high schools. The objectives are to provide over a 3-year period (1,518 hours), the technical knowledge and skill to students interested in qualifying for an FAA Maintenance Technician Certificate of Competency with the Airframe, Powerplant, or combined Airframe and Powerplant ratings. A topical outline, time allotments, curriculum pattern, teacher requirements, and facilities and equipment information are presented. The majority of the material is concentrated on the airframe maintenance technician curriculum, with assignments and necessary information given for each topic. (GEB)

Amended Curriculum
F.A.R. Part 147.7

8258

1. Introduction

The New York City Board of Education Curriculum Development Bureau submits the amended curriculums for Airframe, Powerplant and Airframe and Powerplant Maintenance Technician Ratings to the Department of Transportation, Federal Aviation Administration for approval in accordance with the revised F.A.R. Part 147. The individual curriculum projects are identified as follows:

1. Airframe Maintenance Technician Project 7515
2. Powerplant Maintenance Technician Project 7516
3. Airframe and Powerplant Maintenance Technician Project 7515A

These curriculums will be put to use in those Vocational and Technical High Schools that wish to provide the educational opportunities necessary for teaching the technologies and skills required by interested and motivated students in order to qualify for an F.A.A. Maintenenace Technician Certificate of Competency with the Airframe, Powerplant or combined Airframe and Powerplant ratings.

The New York City school system has the following schools teaching F.A.A. Approved Maintenance Technician Curriculums:

1. Aviation High School
   Mr. Frank Woehr, Principal
   Queens Blvd. and 36 Street
   Long Island City, N.Y. 11101

   a) Airframe Maintenance Technician

   b) Powerplant Maintenance Technician

   c) Airframe and Powerplant Maintenance Technician

2. East New York Vocational and
   Technical High School
   Mr. Solomon Kantowitz, Principal
   1 Wells Street
   Brooklyn, N. Y. 11208

   a) Powerplant Maintenance Technician

Approval of these curriculums and the issuance of amended F.A.A. Maintenance Technician School Ratings for Aviation High School and East New York Vocational and Technical High School is hereby applied for:

3. CURRICULUM PATTERN

All students enrolled in the FAA approved school curriculum (Airframe or Power Plant) follow the same course of instruction during the 10th and 11th school years.

The course content includes those subjects of common interest and importance to both the airframe and power plant ratings. This pattern allows the students to acquire training and experience in both areas of the maintenance technician curriculum. Specialization for either the airframe or power plant maintenance technician curriculum takes place in the 12th year.

The FAA approved airframe or power plant maintenance technician curriculum of the school provides 1518 hours of training and instruction for each course. The minimum hours of instruction required for either the Airframe or Power plant approved curriculum as listed in F.A.R. 147.21 is 1150 hours.

_____ School _____ Date

5. GENERAL NOTES

A. Federal Air Regulations contained in Volumes I, II, III, IV, V, VI and IX and Parts 1, 11, 13, 21, 23, 25, 27, 29, 33, 35, 37, 39, 41, 43, 45, 47, 49, 65 91 and 145 will be covered and taught throughout the Airframe, Powerplant, Airframe and Powerplant and the General Curriculum wherever they are deemed applicable.

B. The use and care of tools, equipment, materials, instruments and essential safety instructions will be taught at the appropriate time in conjunction with the demonstration and information lessons throughout the 10th, 11th and 12th year shops.

C. The basic references recommended and to be followed for the instructional and training program will include: AC65-2A - Airframe & Powerplant Mechanics Certification Guide, The General, Airframe and Powerplant Study Text Books now being prepared for sale by the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402, and any other suitable text book that the individual teacher deems satisfactory. There will be no attempt to restrict or limit the use of texts, instruction sheets, job sheets, information sheets, assignment sheets, audio, visual or animated instructional aids.

_____ School _____ Date

_____ Principal

D. The instructional levels to be maintained are clearly defined in AC 65-2A as follows:

Level 1. Know - basic facts and principles

Be able to - find information, follow directions and written instructions

Knowledge of general principles but limited practical application with no development of manipulative skill

Instruction by lecture, demonstration and discussion

Level 2. Know and understand - principles, theories and concepts

Be able to - find and interpret information and perform basic operations

A high level of skill is not required

Instruction by lecture, demonstration, discussion and limited practical application

Level 3. Know, understand and apply - facts, principles, theories and concepts, Understand how to relate to the total operation and maintenance of aircraft

Be able to - make independent and accurate judgements, perform all operations to a return to service standard

Practical application of general principles to a high degree and development of a sufficient manipulative skill to accomplish return to service

Instruction by lecture, demonstration, discussion and degree of practical application

8266

_____ School _____ Date

_____ Principal

E. Testing of each student's technical knowledge and competence in performing manipulative skills will be conducted by a series of written exams and practical performance projects. This testing and evaluation is indicated at the end of each section for each subject area in the curriculum. This program will consist of the following:

All level 1 learning - a written examination

All level 2 learning - a written examination and a practical project

All level 3 learning - a written examination and a practical work project that must meet "return to service standard"

The curriculum lists the practical work projects that will be used to conduct the performance demonstrations.

A record of the examination grades and performance scores earned by each student, the practical projects completed by each student, will be kept by the school and made a part of each student's accumulative record.

A work progress card will be maintained by the shop teacher who will hold an FAA Maintenance Technicians Certificate of Competency for each student that will show:

(a) each completed practical project

(b) grade earned for each project

(c) score earned for each written examination

(d) attendance and punctuality record

(e) character and personality ratings

_____ School _____ Date

_____ Principal

F. The school will expect each student who satisfactorily completes the FAA Technician Certification Courses, Airframe or Powerplant, to score 70% or higher in the school-administered Final Qualifying Examination to be given at the very end of the completed course of study. Failure to meet this standard will prevent a student from receiving the school FAA course completion graduation certificate. Provisions for continued education and training will be made available during the summer period so that interested and motivated students will be helped to meet the requirements for the FAA school course completion graduation certificate.

School _____ Date _____

Principal _____

6. AIRFRAME MAINTENANCE TECHNICIAN CURRICULUM

I. GENERAL CURRICULUM SUBJECTS

A. BASIC ELECTRICITY (10th, 11th, 12th Year and RT)

1. Measure capacitance and inductance (level 1)

a) The effect of inductive reactance in an electrical circuit.

b) The interrelationship of capacitive and inductive reactance.

c) The term that describes the combined resistive forces in an A.C. electrical circuit.

d) The unit of measurement for capacitance and inductance.

A written examination appropriate to the above subject will be used to determine the degree of learning by the students.

2. Calculate and measure conductivity and electrical power (Level 2)

a) Determine the power furnished by a generator to an electrical system consisting of various electrical units having specific load ratings.

b) Determine the power required by an electric motor that is operating at a specified efficiency and load.

A written examination required and practical projects.

1) Find the power required of a generator supplying various units in an electric circuit

2) Find the power required by an electric motor in an existing circuit under various load conditions.

School _____ Date _____

Principal _____

3. Measure voltage, current, resistance, continuity, and leakage (Level 3)

   a) Use an ohmeter to check for open or short circuits.

   b) The test instruments used to check continuity.

   c) The basic operating principles of D.C. electrical instruments.

   d) The basic operating principles of a galvonometer.

   e) Connect voltmeters and ammeters into an electrical circuit.

   f) The purpose of a shunt resistor when used with an ammeter.

   g) The meaning of prefixes such as micro, mega, kilo, and milli as used in expressing electrical quantities.

   A written examination required and practical projects.

      1) Use an ohmeter to check for short and open circuits in an existing electrical circuit.

      2) Connect an ammeter and a voltmeter in an existing electrical circuit. Use an ammeter requiring an external shunt.

4. Determine the relationship of voltage, current, and resistance in electrical circuits (Level 3)

   a) Determine the current flow in an electrical circuit using variable resistance and voltage valves.

   b) Determine the power requirements of an electrical circuit when the voltage and resistance valves are specified.

   c) The current relationship in an electrical parallel circuit.

School _____ Date _____

Principal _____

d) The unit of measurement used to express electrical power.

e) The principles of electromagnetic induction.

f) The characteristics of magnets and magnetic lines of force.

g) The factors that effect the voltage drop in an electrical conductor.

h) Determine the resistance of an electrical device from the wattage and voltage values specified.

i) Calculate the voltage drop across a resistor.

A written examination required and practical projects.

1) Determine the needs of, select, install, operate and test an electrical circuit using a ZAV supply consisting of the following units: bus, circuit breaker, switch, relay, lamps, and rheostat.

The above project should reflect both series and parallel lamp circuits.

5. Read and interpret electrical circuit diagrams (Level 3)

a) Trace electrical circuits using aircraft wiring diagrams.

b) Identify electrical system malfunctions by reference to circuit diagrams.

c) Identify the commonly used aircraft electrical symbols.

_____ School _____ Date

_____ Principal

A written examination required and practical projects.

1) Wire an aircraft navigation and lighting system mock-up using an aircraft wiring diagram. Incorporate the following units into the lighting system: bus bar, circuit protecting devices, switches, lamps in parallel, variable resistance in series with cabin lamps.

6. Inspect and service batteries (Level 3)

a) Remove spilled electrolyte and treat all adjacent surfaces.

b) Remove and install a battery in the aircraft with a single wire electrical system.

c) Connect batteries to a constant current battery charger.

d) Determine the specific gravity of the battery electrolyte.

e) Perform a high-rate discharge condition test of batteries.

f) The design factors that affect battery voltage and capacity.

g) The factors that determine battery charging rate on a constant voltage source.

h) The indications of a shorted battery cell.

i) The significance of battery capacity ratings.

j) The effects of increased internal resistance on battery operation.

k) The effects of connecting battery cells in series or parallel.

l) The relative advantages of lead-acid and nickel-cadmium batteries for use in aircraft.

_____ School

_____ Principal

m) The principles of battery construction.

n) Check battery electrolyte level.

o) The relationship between battery state of charge and the temperature at which the electrolyte will freeze.

p) The purpose of and requirements for ventilating batteries and battery compartments in civil aircraft.

q) The effect of excessive charging rates on batteries.

A written examination required and practical projects.

1) Remove, clean, service, charge and install batteries in an aircraft. (Use constant current and constant potential charger)

2) Clean and protect battery compartment in an aircraft and service spill-jar.

B. AIRCRAFT DRAWINGS (10th, 11th, 12th Year and RT)

1. Use drawings, symbols, and schematic diagrams (Level 2)

a) Interpret the various types of lines employed in blueprints and schematics.

b) Use schematic diagrams to analyze system malfunctions.

c) Extract a specific electrical circuit from a system drawing.

d) Know why dimensions are used and how they are shown on aircraft drawings.

e) Use installation diagrams to locate and identify components.

School _____ Date _____

Principal _____

A written examination required and practical projects.

1) Install a rotating beacon on an aircraft using blueprints and wire chart as references.

2) Install wiring for a generating system using schematics, charts, and graphs.

3) Using wiring diagram of an aircraft engine instrument system, isolate a particular system, i.e. fuel pressure system, and proceed to correct fuel pressure system malfunction.

4) Rig a centersection on a biplane using specifications shown on a blueprint.

5) Layout a drawing to specifications. Transfer layout information to a piece of flat stock. Fabricate fitting.

2. Draw sketches of repairs and alterations (Level 3)

a) Illustrate a major repair or alteration.

b) Use dividers, compass, ruler, T-Square, etc., in the development of sketches of repairs and alterations.

c) Use standard drafting procedures.

A written examination required and practical projects.

1) Recover a control surface, fill out form 337 and appropriate records.

120 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

School Date

Principal

2) Repair damage to stressed skin area of fuselage, fill out form 337 and appropriate records.

3) Install an oil cooler on an engine other than that shown on data sheet, fill out form 337 and appropriate records.

3. Use blueprint information (Level 3)

a) The information presented in blueprint title blocks

b) The common symbols used on aircraft blueprints

c) Install and modify component parts by reference to blueprints

d) Identify the changes made to a blueprint

A written examination required and practical projects.

1) The drafting department curriculum provides adequate time and practice in areas a, b, and d above

2) Modify a stringer installation by reference to blueprints.

3) Install an electrical oil pressure gauge using installation prints and specifications.

4. Use graphs and charts (Level 3)

a) Determine electric cable size and current carrying capacity

b) Determine engine power requirements

A written examination required and practical projects.

1) By referring to the electrical cable chart in AC 43 13-1 determine the size of an aluminum cable to replace a copper cable for the inverter.

School _____ Date _____

Principal _____

2) During ground run use the manufacturer's manual to determine if the engine meets manufacturer's requirements.

C. WEIGHT AND BALANCE (12th Year and RT)

1. Weigh aircraft (Level 2)

a) Use aircraft specifications for weighing purposes.

b) Locate jacks and scales in the correct position.

c) Prepare aircraft for weighing.

A written examination required and practical projects.

1) Weigh an aircraft and record the scale readings.

2. Perform complete weight and balance check and record data (Level 3)

a) Determine that the foreward or rearward center of gravity (C.G.) limit is not exceeded on a specified aircraft.

b) The point of reference for all weight and balance measurements.

c) The procedure for computing "minimum fuel."

d) Locate the information that should be known to compute weight and balance.

e) The method of expressing additions or removals of equipment for weight and balance purposes.

f) Determine the fully loaded center of gravity of an aircraft.

g) Determine the "maximum authorized weight" of an aircraft.

School _____ Date _____

Principal _____

h) The method of determining aircraft empty weight, when engine oil and hydraulic fluid are contained in supply tanks.

i) The effect on weight and balance of replacing a component with another of different weight and location.

j) Calculate the maximum cargo or baggage weight that can be carried by an aircraft.

k) The record requirements for weight and balance data.

l) The hazards of exceeding aircraft fore and aft center of gravity limits.

m) The critical conditions of helicopter load and balance.

n) Determine aircraft empty weight and empty weight center of gravity.

o) Define maximum gross weight.

p) Determine the moment of an item of equipment.

q) Account for tare weight when weighing an aircraft.

A written examination required and practical projects.

1) Compute new empty weight, empty weight center of gravity, and useful load. Complete appropriate record requirements.

2) Change or remove equipment from an aircraft, such as propeller, seats, gas tanks, etc. Compute new weight and balance, reflecting a corrected empty weight, empty weight center of gravity, useful load, fore and aft check and correction where necessary. This project must utilize such specifications and references as "Data Sheets" "A.CA 65. 13-1" and equipment list.

8277

School _____ Date _____

Principal _____

D. FLUID LINES AND FITTINGS (11th, 12th Year and RT)

1. Fabricate and install rigid and flexible fluid lines and fittings (Level 3)

a) Single and double-flare tubing.

b) Install military standard (MS) flareless fittings

c) The significance of the identification stripes that appear on aircraft hose

d) Fabricate and install beaded tubing

e) Use lubricants and sealants in the assembly of lines and fittings

f) Identify flexible hydraulic lines

g) Install hose clamps

h) Determine the bend radii for rigid tubing

i) Fabricate aluminum tubing using standard AN flared tube fittings

j) Route fluid lines in entryways and passenger, crew, or baggage compartments.

k) Repair metal tube lines

l) Route fluid lines adjacent to electrical power cables.

m) Install rigid tubing.

n) Select tube flaring tools

o) Identify AN fitting materials from color designators

p) The maximum reduction in original outside diameter allowed when bending aluminum alloy hydraulic lines.

School

Principal

q) The procedure to follow if scratches are detected on an aluminum alloy tube.

r) The storage requirements for hydraulic hose.

s) Install flexible hydraulic hose.

t) The lubricant used when assembling oxygen fittings.

A written examination required and practical projects.

1) Make up a replacement fluid line (rigid and flexible) and install the line in an aircraft or system mock-up. Use both AN and MS fittings.

2) Repair a rigid or a flexible fluid line using a union or repair a high pressure line using a replacement section.

E. MATERIALS AND PROCESSES (10th, 11th, 12th Year and RT)

1. Identify and select appropriate nondestructive testing methods (Level 1)

a) The use of radiography in aircraft and component inspection

b) The use of ultrasonic inspection methods for detecting cracks.

c) The applicability of magnetic particle inspection methods to engine crankshafts.

d) The method for detecting surface cracks in aluminum castings and forgings.

e) The technique for locating cracks in materials when only one side of the material is accessible.

A written examination appropriate to the above subject will be used to determine the degree of learning by the students.

_____ School _____ Date

_____ Principal

2. Perform penetrant, chemical etching, and matnetic particle inspections. (Level 2)

   a) The general procedure for performing magnetic particle inspection.

   b) Demagnetize steel parts after magnetic particle inspection.

   c) Clean parts in preparation for penetrant inspection.

   d) The visual indications of a subsurface flaw or fracture during magnetic particle inspection.

   e) Locate cracks and blowholes in welded assemblies.

   f) The procedure for using dye penetrants.

   g) Distinguish between heat-treated and non-heat-treated aluminum alloys when the identification marks are not on the material.

A written examination required and practical projects.

1) Using dye-penetrant method of inspection examine suspected areas of an aircraft engine power section.

2) Using the magnetic particle type of inspection equipment inspect various engine parts, piston pin, connecting rod, crankshaft, and welded assembly.

3) Using acceptable trade practices distinguish between a heat treated and a non-heat treated piece of aluminum alloy.

4) Inspect an aluminum propeller blade using the caustic soda etching method.

5) Inspect a landing gear component by use of magnetic particle equipment.

School _____ Date _____

Principal _____

6) Inspect an aircraft and/or powerplant aluminum alloy part using the "Zyglo" method of inspection.

3. Perform basic heat-treating processes (Level 2)

a) The types of aluminum alloys considered to be heat treatable.

b) Anneal copper tubing.

c) The steps in heat treatment of aluminum alloys.

d) The effects of various forms of heat treatment.

e) The effect of incorrect heat treatment on the corrosion-resistant properties of aluminum alloys.

f) Identify the degree of temper for aluminum alloy products from code designators.

g) The effect of heating a metal slightly above its critical temperature, and then rapidly cooling it.

h) The effect of strain hardening on the tensile strength of aluminum alloy.

i) The relationship between tensile strength and metal hardness.

j) Anneal a welded steel part.

A written examination required and practical projects.

1) Remove a copper primer line, anneal, and reinstall.

2) Anneal a welded steel tubing joint or cluster.

3) Heat treat and form an aluminum alloy rib.

4) Heat treat a new machined center punch.

School Date

Principal

4. Identify and select aircraft hardware and materials (Level 3)

   a) Identify aluminum alloys from code designators.

   b) Identify steel from code designators.

   c) The identification markings of AN standard steel bolts.

   d) Identify aircraft cable.

   e) The characteristics of a material that affect its ability to be hammered, rolled, or pressed into various shapes.

   f) The SAE system of identifying steel.

   g) Determine wrought aluminum alloy composition and condition by referring to aluminum codes.

   h) Install self locking nuts.

   i) Determine the correct length bolt to use.

   j) Determine correct torque values for tightening aircraft nut and bolts.

   k) Determine rivet composition, condition, shape, and dimension by referring to Rivet Code.

   l) Identify materials suitable for use for firewalls and exhaust shrouds.

   m) Install castle nuts.

   n) The strength characteristics of type "A" rivets.

   o) The characteristic of aluminum alloy rivet material that causes some rivets to require several days to reach their ultimate strength.

School _____ Date _____

Principal _____

p) Determine that materials used in aircraft maintenance and repair are of the proper type and conform to the sppropriate standards.

q) The characteristics of aluminum - clad sheet aluminum alloy.

A written examination required and practical projects.

1) Fabricate an aluminum alloy control surface.
2) During engine overhaul assemble sylinders and torque to proper value.
3) Install an aircraft control surface using castellated nuts.
4) During engine overhaul install connecting rods using castellated nuts.
5) Replace an aircraft control cable in an aircraft.
6) Replace a propeller governor control cable.
7) Install bolts using self locking nuts during engine overhaul.
8) Install bolts using self locking nuts during replacement of components on aircraft.
9) Select steel and aluminum alloy using code designators in fabricating aircraft fittings and brackets.
10) Make stressed skin repair.

School _____ Date _____

Principal _____

5. Inspect and check welds (Level 3)

a) The characteristics of a good weld.

b) The types of stress that welded joints can withstand.

c) The effect of welding over a previously brazed or soldered joint.

A written examination required and practical projects.

1) Weld a steel tubing cluster.

2) Inspect a welded tube structure, i.e., welded tube engine mount, welded tube fuselage structure.

6. Perform precision measurements (Level 3)

a) Use a micrometer and a caliper to make precision measurements.

b) Measure a small hole using micrometer and a hole gauge.

c) Read and interpret a vernier micrometer scale.

d) Use a dial indicator, V blocks, and a surface plate to check the alignment of a shaft.

A written examination required and practical projects.

1) During engine overhaul inspect various parts for wear and proper clearance.

2) During engine overhaul inspect a camshaft and/or crankshaft for runout.

School _____ Date _____

Principal _____

F. GROUND OPERATION AND SERVICING (12th Year and RT)

1. Start, ground operate, move, service and secure aircraft (Level 2)

a) The procedure for extinguishing fires in the engine induction system during starting.

b) Use hand signals to direct aircraft movement.

c) Select and use external auxiliary power units for engine starting.

d) Tie down and secure aircraft for outside storage.

e) Protect aircraft fuel system from contamination during fueling operations.

f) Connect and operate an external source of hydraulic power.

g) Start and operate an engine equipped with a float type carburetor.

h) Check a reciprocating engine for liquid lock.

i) Operate hand and electrical priming systems during engine starting.

j) Start and operate an engine equipped with a pressure injection carburetor.

k) Start and operate an engine equipped with an internal supercharger.

A written examination required and practical projects.

1) Move, tie-down, and store aircraft on hangar apron and in hangar.

2) Pre-start check a reciprocating engine including a check for liquid lock.

School Date

Principal

3) Start an aircraft engine using an A.P.U.

4) Start and run an aircraft engine with an internal supercharger.

5) Start and run an aircraft engine with a pressure injection carburetor.

6) Start and run an aircraft engine with a float type carburetor.

7) Service an aircraft engine with fuel and oil.

8) Operate aircraft actuating mechanisms with an external source of hydraulic power.

2. Identify and select fuels (Level 2)

a) The effect of ethylene dibromide added to aviation gasoline.

b) The identifying color of various grades of aviation gasoline.

c) The characteristic of a fuel that affects its tendency to "vapor lock."

d) The significance of the numbers used to designate various grades of aviation gasoline.

e) The relative advantages of gasoline and kerosine for use as fuel for turbine engines.

f) Determine the types of fuel to be used with a specific aircraft.

g) The factors affecting the antiknock characteristics of fuel.

A written examination required and practical projects.

1) Refuel various aircraft requiring several grades of fuel.

School _____ Date _____

Principal _____

G. CLEANING AND CORROSION CONTROL (10th, 11th, 12th Year and RT)

1. Identify and select cleaning materials (Level 3)

a) The effect of caustic cleaning products on aluminum structures.

b) The characteristics and use of chemical cleaners.

c) Clean aluminum and steel engine parts.

d) The type cleaner for use on high strength metals.

e) The methods for cleaning turbine engine compressor blades.

A written examination required and practical projects.

1) Clean an engine in preparation for PIS assembly.

2) Clean engine parts in preparation for inspection.

3) Clean an aircraft structure in preparation for painting.

4) Clean engine exhaust systems.

2. Perform aircraft cleaning and corrosion control (Level 3)

a) Protect tires and other rubber products from the deteriorating effects of cleaning materials.

b) The cause and corrective procedures for fretting corrosion.

c) Identify and control intergranular corrosion of heat treated aluminum alloy.

d) Protect structure against dissimilar metal corrosion.

e) Prevent and remove rust.

f) The effect of oily, dirty surfaces on the operation of high performance aircraft.

g) Protect interior surfaces of closed steel and aluminum tubing against corrosion.

School _____ Date _____

Principal _____

h) The methods of protecting aluminum alloy parts against corrosion.

i) Clean and protect battery compartments and adjacent areas.

j) Remove corrosion products such as metal flake, scale powder and salt deposits from aluminum.

k) Clean corrosion resistant parts by blast cleaning methods.

l) Use paints and similar organic coatings for corrosion protection purposes.

A written examination required and practical projects.

1) Clean and protect a battery compartment on an aircraft.

2) Clean exhaust collectors and shrouds.

3) Cover tires of stored aircraft against oil and solvent drippings.

4) Remove rust from the exterior of spark plugs and paint.

5) Wash down aircraft.

6) Clean, zinc chromate, and paint aircraft fittings and brackets before installing.

7) Use par-al-ketone to protect exterior surfaces of engines in storage.

8) During fabrication of a control surface (Aileron) use proper corrosion protection between dissimilar metals.

_____ School _____ Date

_____ Principal

H. MATHEMATICS (10th, 11th, 12th Year and RT)

1. Extract roots and raise numbers to a given power (Level 1)
2. Determine areas and volumes of various geometrical shapes (Level 2)
3. Solve ratio and proportion and percentage problems (Level 3)
4. Perform algebraic operations involving addition, subtraction, multiplication, and division of positive and negative numbers (Level 3)

Students will demonstrate competency with this subject while performing practical projects and written examinations at appropriate times throughout the curriculum. Selected projects would include: weight and balance computations, flat pattern layout development, electric circuit computations, and calculating gear ratios and engine displacement.

I. MAINTENANCE FORMS AND RECORDS (11th, 12th Year and RT)

1. Write descriptions of aircraft condition and work performed (Level 3)
   a) Describe the repairs made to an aircraft structure.
   b) State aircraft condition based upon inspection.

   A written examination required and practical projects.

   1) Make a log book entry describing repairs made to an aircraft and/or powerplant.
   2) Perform a 100 hour inspection to an aircraft and/or powerplant and submit a completed inspection report and discrepancy list.

_____ School _____ Date

_____ Principal

2. Complete required maintenance forms, records, and inspection reports (Level 3)

   a) Enter the required information in the permanent maintenance records when a minor repair has been performed.

   b) Prepare and properly dispose of FAA Form 337.

   c) The minimum information required to be entered in the maintenance records after maintenance or alteration of aircraft.

   d) Make record entries to indicate compliance with airworthiness directives.

   e) The definition of "Time In Service" with respect to maintenance records.

   f) The record requirements for returning aircraft to service after 100 hour inspection.

   g) The requirement for maintaining a permanent record of aircraft maintenance.

   h) The definition of "Repair" as related to aircraft maintenance.

   i) The requirements for a permanent maintenance record.

A written examination required and practical projects.

   1) Make a log book entry reflecting a major repair made to an aircraft and/or powerplant and execute an FAA Form 337.

School _____ Date _____

Principal _____

2) Make a log book entry reflecting compliance with an airworthiness directive.

3) Make a log book entry reflecting return to service after completing a 100 hour inspection.

J. BASIC PHYSICS (10th, 11th, 12th Year and RT)

1. Use the principles of simple machines; sound, fluid, and heat dynamics. (Level 2)

The course content includes classroom and laboratory experiments and demonstrations in the theory and application of the laws of physics as applied to aviation in the performance and operation of aircraft and powerplants and the functioning of its support systems.

Examples: Charles Law, Boyles Law, Pascals Law, Bernoulli Theorum, Newtons Laws, Otto Cycle, Braden Cycle are examples of the basic concepts incorporated in the curriculum.

K. MAINTENANCE PUBLICATIONS (10th, 11th, 12th Year and RT)

1. Select and use FAA and manufacturer's aircraft maintenance specifications, data sheets, manuals, and publications, and related Federal Aviation Regulations (Level 3).

a) Determining the suitability of a propeller for use with a particular engine - airplane combination.

b) Determine the minimum diameter of a propeller type and model when used with a particular engine.

School Date

Principal

c) Locate aircraft leveline and weighing information.

d) Determine engine/propeller speed ratios.

e) The instrument markings required on a specified type and model aircraft.

f) The purpose and applicability of technical standard orders.

g) The purpose and applicability of supplemental type certificates.

h) Identify the useful load and empty weight C.G. of an aircraft by reference to data.

i) Use FAA specifications and type certificate data sheets.

j) The applicability and requirements for aircraft airworthiness certificates.

k) Determine the control surface movement limits of a specified aircraft.

l) Determine seat locations of an aircraft using aircraft specifications.

m) Use aircraft listing to find information about aircraft of limited production.

n) The purpose and applicability of FAA airworthiness directives.

o) Use "Table of Limits" to determine condition of parts.

A written examination is required and practical projects.

1) During the performance of a 100 hour inspection, determine from the aircraft data sheet that the powerplant/propeller combination is correct and that the diameter of the propeller is within limits.

School Date

Principal

2) During the weighting of an aircraft make use of the aircraft data sheets to determine the identification of, and location of the leveling means, seat location, and gross weight.

3) Check instrument marking and placards using aircraft and powerplant data sheets.

4) During engine overhaul make use of manufacturers instruction manuals and table of limits.

5) Determine the airworthiness of various pieces of equipment by referring to technical standard orders.

6) During the performance of a 100 hour inspection refer to summary of airworthiness directives for mandatory adherence data sheets for control surface travel.

2. Read technical data (Level 3)

a) Find specified information in technical reports and manuals.

L. MECHANIC PRIVILEGES AND LIMITATIONS.(12th Year)

1. Exercise mechanic privileges within the limitations prescribed by FAR 65 (Level 3)

a) The criteria for determining the classification (major, minor, or preventive maintenance) of airframe repairs and alterations.

b) The criteria for determining the classification (major, minor or preventive maintenance) of powerplant repairs and alterations.

School _____ Date _____

Principal _____

c) The criteria for determining the classification (major, minor, or preventive maintenance) of propeller repairs and alteration.

d) Return an aircraft to service after installation of an engine type other than that for which the aircraft was originally certificated.

e) The minimum age requirement for issuance of a mechanic certificate.

f) The privileges of a mechanic in relation to 100-Hour and annual inspections.

g) The requirements for reporting change of address.

h) The duration or effective period of a mechanic certificate.

i) The requirements an applicant must meet for issuance of a mechanic certificate.

j) Determine the maintenance classification (major repair, minor repair, preventive maintenance) of Landing Gear tire removal, installation, and repair.

k) Determine the maintenance classification (major repair, minor repair, preventive maintenance) of servicing Landing Gear shock struts.

l) Determine the repair classification (major repair, minor repair, preventive maintenance) of repairs to steel tubing structures by welding.

m) Determine the repair classification (major repair, minor repair, preventive maintenance) of replacing the fabric on fabric - covered parts such as wings, fuselages, stabilizers, and control surfaces.

_____ School _____ Date

_____ Principal

3. Repair a damaged steel tubing structure and/or overhaul a cylinder. Establish authority to do the work necessary. Refer to Part 65, and classify the work required as to a major repair, minor repair or preventive maintenance. Refer to Part 43.

4. Recover a control surface and/or remove and service a set of spark plugs. Establish authority to do the work necessary. Refer to Part 65, and classify the work required as to a major repair, minor repair or preventive maintenance. Refer to Part 43.

5. Replace a Landing Gear shock strut and/or a rebuilt generator. Establish authority to do the work necessary. Refer to Part 65 and classify the work required as to a major repair, minor repair or preventive maintenance. Refer to Part 43.

School _____ Date _____

Principal _____

II. AIRFRAME STRUCTURES

A. WOOD STRUCTURES (10th, 12th Year, General Science)

1. Service and repair wood structures (Level 1)

a) The general requirements of scarf splice joints.

b) The repair procedure for elongated holes in wood spars.

c) The permissible wood substitutes for use in making repairs to wood structures.

d) The procedures for repairing wood rib capstrips.

e) The characteristics of glue used in aircraft construction and repair.

f) The procedures for sealing the inner surfaces of wooden structure that is to be assembled by gluing.

g) The general characteristics of wood commonly used in Aircraft construction.

A written examination appropriate to the above subjects will be used to determine the degree of learning by the students.

2. Identify wood defects (Level 2)

a) Recognize acceptable and nonacceptable wood defects.

A written examination required. Practical Projects.

1) Inspect a wood spar for acceptable defects.

School _____ Date _____

Principal _____

3. Inspect wood structures (Level 2)

   a) The effect of moisture content on wood size and strength.

   b) The strength characteristics of wood structures.

   c) The characteristics of plywood and laminated wood.

   A written test is required. Practical Project.

   1) Students will inspect a sample wood aircraft structure.

B. AIRCRAFT COVERING (10th, 12th Year, RT)

1. Select and apply fabric and fiberglass covering materials (Level 1)

   a) The factors to consider in selecting aircraft fabric.

   b) The types of seams commonly used in aircraft fabric coverings.

   c) The general requirements for making doped and lapped seams.

   d) The meaning of the term "warp" as used in reference to aircraft textile products.

   e) The precautions to observe when installing surface tape on control surfaces.

   A written examination appropriate to the above subject will be administered to determine the degree of learning by the student.

2. Inspect, test and repair fabric and fiberglass (Level 3)

   a) Determine the condition of aircraft fabric.

   b) Apply a doped-on patch to aircraft fabric.

School _____ Date _____

c) Make a sewed repair to a fabric-covered surface.

d) The areas on a fabric-covered aircraft most susceptible to corrosion.

A written examination required and practical projects.

1) Cover an aircraft structure with aircraft fabric.

2) Test and repair fabric covered aircraft structure.

C. AIRCRAFT FINISHES (10th, 12th Year, General Science)

1. Apply trim, letters and touch-up paint (Level 1)

a) The requirements for registration markings.

b) The relative proportions of identification markings.

c) The use of color and ornamentation when applying registration markings.

A written examination appropriate to the above subject will be used to determine the degree of learning by the students.

2. Identify and select aircraft finishing materials (Level 2)

a) The characteristics of butyrate and acetate dopes.

b) The types of thinners used with various types of paint and dope.

c) The characteristics of fabric rejuvenators.

d) The types of priming paints generally used on aircraft.

e) The type of paint used to coat the insides of battery compartments.

A written examination appropriate to the above subject will be used to determine the degree of learning by the students and the practical projects will consist of:

School _____ Date _____

Principal _____

1) Apply clear dope to a fabric covered aircraft surface.

2) Apply primer to a metal aircraft surface.

3. Apply paint and dope (Level 2)

a) The purpose of fungicidal dope in aircraft finishing.

b) The application of rejuvenator to repair an aged dope finish.

c) The products and methods used to dopeproof airframe structures.

d) The effect of atmospheric conditions on dope during its application.

e) Sand and rub aircraft finishes.

f) Apply primer to aluminum alloy parts.

g) Use and maintain a paint spray gun.

h) The purpose of brushing the first coat of dope instead of spraying.

Written examination required and practical projects.

1) Spray pigmented dope on aircraft fabric.

2) Spray paint on a metal aircraft surface.

4. Inspect finishes and identify defects (Level 2)

a) The type of painting defect caused by moving the spray gun in an arc instead of a straight line.

b) The cause of runs and sags in aircraft finishes.

Written examination required and practical projects:

1) Student to demonstrate proper spraying technique.

_____ School _____ Date

_____ Principal

D. SHEET METAL STRUCTURES (10th, 12th Year and RT)

1. Install special rivets and fasteners (Level 2)

a) Determine correct rivet length and diameter.

b) Install a Hi-Shear rivet.

c) The precautions concerning rivet fit.

d) Install Deicer boot fasteners.

e) Install blind type rivets.

f) The stresses that a rivet is designed to resist.

A written test is required. The practical projects are:

1) Assemble two aluminum alloy plates utilizing conventional rivets, Hi-Shear rivets, cherry rivets and riv-nuts.

2. Inspect bonded structures (Level 2)

a) The reason for using metal sandwich panels in high-speed aircraft construction.

b) The use of the metallic "ring" test to inspect for delamination damage of bonded structures.

c) Evaluate the extent of damage to a bonded structure and determine the type of repair needed.

A written test is required. The practical projects are:

1) Student to make a visual inspection of a sample bonded aircraft structure.

School _____ Date _____

Principal _____

3. Inspect and repair plastics, honey-comb, and laminated structures (Level 2)

   a) Distinguish between transparent plastic and plate-glass enclosures.

   b) Protect plastics during handling and repair operations.

   c) Remove scratches and surface crazing from plastic enclosures.

   d) Drill shallow or medium depth holes in plastics materials.

   e) The effect of moisture entrapped in honey-comb structures.

   f) Use a router to remove damaged area from honey-comb panels.

   g) Clean honey-comb panels prior to patching.

   A written test is required. Practical Project.

   1) Clean and polish plastic canopy and windshield enclosures.

4. Inspect, check, service, and repair windows, doors and interior furnishings (Level 2)

   a) Clean transparent plastic window and windshield materials.

   b) Inspection procedures and airworthiness requirements for safety belts.

   c) The characteristics of acrylic plastic enclosure materials.

   d) Maintain safety belts.

   e) Secure transparent plastic enclosure material to aircraft structure.

   f) Protect transparent plastic enclosure material during handling and storage.

School Date

Principal

g) The physical characteristics of transparent plastic enclosure materials.

h) Form and shape acrylic plastic.

i) Repair shallow surfaces scratches in transparent plastic enclosures.

A written test is required;the practical projects are:

1) Make an airworthiness inspection of seat belts and their installation.

5. Inspect and repair sheet-metal structures (Level 3)

a) Select and use twist drills.

b) Select and use a hand file for soft metals.

c) Prepare dissimilar metals for assembly.

d) Determine the type, size and number of rivets for use in structural repairs.

e) Repair sheet metal flight control surfaces.

f) The loads acting on a semimonocoque fuselage.

g) The construction characteristics of monocoque and semimonocoque fuselage.

h) The construction characteristics of canti-lever wing structures.

i) The types of loads carried by wing spars.

j) Drill holes in stainless steel.

k) Define shear failure.

l) Repair a hole in a stressed skin metal wing.

School _____ Date _____

Principal _____

m) Repair a section of damaged skin using a single-lap sheet splice.

n) Construct a watertight joint.

o) Countersink a hole.

p) Perform dimpling process.

q) Select the correct rivet to accomplish a repair using a specified material.

r) Repair or splice stringers on the lower surface of a stressed-skin metal wing.

s) Determine the correct rivet layout and spacing for a specified repair.

t) Use proper riveting techniques.

u) Stop drill cracks in sheet metal.

v) Repair a slightly oversize hole.

w) Repair structural units, such as spars, engine supports, etc. that have been built from sheet metal.

x) Repair shallow scratches in sheet metal.

y) Determine the condition of a stressed-skin metal structure that is known to have been critically loaded.

z) Use a reamer.

A written test is required. The practical projects are:

1) Construct and assemble a metal control surface.

2) Make a stressed skin repair. *

3) Make a stringer repair. *

* In conformance with AC-43.13-1

School _____ Date _____

Principal _____

6. Install conventional rivets (Level 3)

   a) Prepare sheet metal for installation of flush rivets.

   b) Identify and select rivets.

   c) Determine the correct rivet length and diameter.

   d) Select and use the correct rivet set for specified rivet head styles.

   e) Select and use bucking bars.

   f) Remove rivets.

   g) Determine the condition of a driven rivet.

   h) Determine the circumstances under which 2117 rivets may be used to replace 2017 and 2024 rivets.

   i) Define rivet tipping.

   j) Determine the correct number of rivets to be used in making a structural sheet metal repair.

   k) Handle and install rivets that require heat treatment prior to use.

   l) Adjust and use an air operated riveting gun.

   m) The circumstances under which type "A" rivets may be used in aircraft.

   n) The mechanical properties of heat-treated rivets.

A written test is required. The practical projects are:

   1) Make a fuselage frame splice using several different alloy rivets (AD, D, DD) and incorporate some oversize rivets.

School _____ Date _____

Principal _____

7. Hand form, layout, and bend sheet metal (Level 3)

a) Make a joggle or offset bend.

b) Bend sheet metal that requires the use of a large radius.

c) Determine the neutral axis of a bend.

d) Define bend radius.

e) Determine the amount of material required to make a specified bend.

f) Bend sheetmetal to a specified angle.

g) Lay out and bend a piece of sheet metal using minimum radius for the type and thickness of material specified.

h) Lay out a bend in relationship to metal "grain" to minimize the possibility of cracking.

i) Determine the flat layout dimensions of a component part to be formed by bending.

j) Form metal by bumping.

A written test is required. The practical projects are:

1) Make a "U" channel aircraft spar section.

2) Form metal rib for the metal control surface.

School _____ Date _____

Principal _____

WELDING (11th, 12th Year and RT)

1. Weld magnesium and titanium (Level 1)

   a) The method of cleaning magnesium in preparation for welding.

   b) The main function of a flux while welding magnesium.

   c) The types of gases to use when gas welding magnesium.

   d) The use of butt joints when gas-welding magnesium.

   Written examination required.

2. Solder Stainless Steel (Level 1)

   a) The use of silver soldering as a method of bonding metals.

   b) The preparation of stainless steel for soldering.

   c) The methods of cleaning material after soldering.

   Written examination required.

3. Fabricate tubular structures (Level 1)

   a) The types of tubing splices.

   b) The proper welding sequence to use when welding - fuselage tubes.

   c) The characteristics of a welded tubing joint.

   d) The protection of the interior of tubular steel that is to be closed by welding.

   e) The methods used to control distortion of steel tube structures during welding repairs.

   f) The preparation of tube ends for welding.

   Written examination required.

School _____ Date

Principal _____

4. Solder, braze, gas, and arc-weld steel (Level 2)

   a) Use cleaning operations to prepare sheet steel for welding.

   b) Adjust oxyacetylene welding torch to produce the type flame needed to weld a specified material.

   c) Select and use filler rod.

   d) The effect of excessive heat on metal.

   e) Operate a portable welding set.

   f) Select the correct size welding torch tip.

   g) The precautions regarding welding over a previously brazed or soldered joint.

   h) Solder a wire or cable to an electrical component.

   i) Sweat solder a lap joint.

   j) Normalize a steel part after welding.

   k) Identify steel parts considered to be repairable by welding.

   l) The preheating required prior to welding.

   Written examination required and practical project.

      1) Gas weld a steel tubular "T" joint.

      2) Weld a steel tube to a plate.

5. Weld aluminum and stainless steel. (Level 2)

   a) Use a filler rod when welding aluminum with oxyacetylene.

   b) Use flux when welding aluminum.

   c) The purpose and effect of using inert gas to shield the arc in certain types of welding.

School _____ Date _____

Principal _____

Written examination required and practical projects.

1) Butt weld two pieces of sheet aluminum using the inert gas method.

2) Butt weld two pieces of stainless steel using the inert gas method.

F. ASSEMBLY AND RIGGING (10th, 12th Year and RT)

1. Rig rotary-wing aircraft (Level 1)

a) The condition of flight that a properly rigged aircraft should maintain.

b) The relationship of thrust and drag of an aircraft during level unaccelerating flight.

c) The relationship of lift and weight of an aircraft during level unaccelerating flight.

d) The meaning of the term "angle of attack" of an airfoil.

e) The type of control movement used to induce forward flight in a helicopter.

f) The method of controlling vertical flight of a helicopter.

g) The movement of an aircraft about its axes during normal flight maneuvers.

h) The factors affecting stability of an aircraft abouts its axes.

i) The methods of maintaining directional control of a helicopter.

j) The cause and effect of rotor blade stall in helicopters operating at high speeds.

School _____ Date _____

Principal _____

k) The cause of vertical vibration in a two-blade helicopter rotor system.

l) The preparations required prior to rigging.

m) The method of tracking helicopter main rotor blades.

Written examination required.

2. Rig fixed-wing aircraft (Level 2)

a) The condition of flight that a properly rigged aircraft should maintain.

b) The factors to consider when rigging vertical stabilizer of single-engine, propeller-driven aircraft.

c) The relationship of thrust and drag of an aircraft during level unaccelerating flight.

d) The effect of incorrect wing incidence angle.

e) The effect of dihedral on aircraft stability.

f) Use wing "wash-in" and "wash-out" to correct aircraft rigging.

g) The relationship of lift and weight of an aircraft during level unaccelerating flight.

h) The meaning of the term "angle of attack" of an airfoil.

i) The effect of flaps on aircraft landing speed and approach angle.

j) The meaning of the term "incidence angle" of an airfoil.

k) The movement of an aircraft about its axes during normal flight maneuvers.

l) The relationship between the center of pressure of a wing and its angle of attack.

School _____ Date _____

Principal _____

m) The factors affecting stability of an aircraft about its axes.

n) The usual location of aircraft c.g. in relationship to center of lift.

o) The changes in lift and drag of the wings when an aircraft is rolled about its longitudinal axis.

p) The procedure for establishing wing angle of incidence prior to repairing wing attachment fittings.

Written examination required and the practical projects.

1) Level aircraft laterally and longitudinally.

2) Assemble and rig a high wing strut braced monoplane.

3. Check alignment of structures (Level 2)

a) Prepare fuselage for alignment check.

b) Check alignment of internally braced wing structure.

c) The significance and method of expressing reference positions.

d) Check alignment of assembled aircraft.

Written examination required and the practical projects.

1) Check the alignment of an internally braced wing.

2) Check the alignment of a tubular fuselage.

3) Check the alignment of a semi-monocoque fuselage.

4. Assemble Aircraft (Level 3)

a) The methods of safetying aircraft screws, bolts and nuts.

b) Assemble, adjust and safety cable turnbuckles.

c) The correct method of inserting bolts in aircraft fittings.

d) Install and inspect swaged cable terminals and fittings.

8311

School _____ Date _____

Principal _____

Written examination required and the practical projects are:

1) Install attaching hardware on a control surface installation.

2) Make up a control cable using swaged terminals.

3) Install and safety an aircraft control cable.

5. Balance and rig movable surfaces (Level 3)

a) The inspection requirements for cable-operated primary flight control systems.

b) Handle and make up control cables.

c) The corrosion protection requirements of control cables.

d) The effect of overtightening control cables.

e) The relationship between specified movements of the cockpit controls and the control surfaces.

f) The relationship between specified control movements during flight and the movement of the aircraft about its axes.

g) The movement of the controls, control surfaces, and the aircraft about its axes during normal flight maneuvers.

h) Balance control surfaces after repair.

i) The relationship between specified movements of the trim tab operating device and the trim tab.

j) Secure the cockpit flight controls in preparation for control surface rigging.

k) The effect of a worn pulley in a cable-operated control system.

School Date

Principal

l) The means used to reduce or prevent control surface flutter.

m) The purpose and operation of control surface locks.

n) The purpose and operation of differential controls.

o) The purpose and applicability of fairleads in a cable operated control system.

p) Install and rig the cables in a flight control system.

q) Splice control cables using Nicopress sleeves.

r) The probable causes of control surface flutter.

s) The maintenance requirements of control surface trim tab systems.

t) The purpose of counterweights incorporated into the leading edges of some primary control surfaces.

u) The purpose and function of "spring tabs" and "servo tabs."

v) Measure control surface movement and adjust control stops.

w) The effect of temperature changes on control system cable tension.

x) Assemble, adjust, inspect and safety push-pull type flight control systems.

Written examination required and the practical projects.

1) Check, balance and install a cable operated aircraft control surface to manufacturer's specifications including trim tabs.

School _____ Date _____

Principal _____

2) Check, balance and install a push-pull tube operated aircraft control surface to manufacturer's specifications, including trim tabs.

3) Make up and splice aircraft control cable using Nicopress sleeves.

6. Jack aircraft (Level 3)

a) Determine maximum allowable jacking weight.

b) The use of correct capacity jacks.

c) Protect aircraft from damage during lifting and lowering operations.

d) Use ballast when jacking aircraft with engine removed.

e) The effects of wind when jacking aircraft.

Written examination required and the practical projects:

1) Jack an aircraft observing all necessary precautions for:

(a) rigging

(b) landing gear "swing" check.

G. Airframe Inspection (10th, 12th Year and RT)

1. Perform airframe conformity and airworthiness inspections (Level 3)

a) The maximum period of time an aircraft can be flown before an annual inspection is required.

b) Determine the condition of airframes, airframe systems, and components.

School Date

Principal

c) The primary purpose of inspection.

d) The maximum time an aircraft that carries passengers for hire or is used in flight instruction can be flown before being inspected.

e) Determine that an aircraft is in conformity with FAA Specifications.

f) Determine that applicable Airworthiness Directives have been complied with.

g) Conduct a thorough and detailed inspection of an aircraft.

Written examination required and practical project.

1) A 100 hour inspection of the airframe in accordance with appropriate federal air regulations.

_____ School _____ Date

_____ Principal

III. AIRFRAME SYSTEMS AND COMPONENTS

A. Aircraft Landing Gear Systems (11th, 12th Year)

1. Inspect, check, service and repair landing gear, retraction systems, shock struts, brakes, wheels, tires, and steering systems (Level 3)

a) Determine aircraft tire inflation pressures.

b) The factors affecting the retreading of aircraft tires.

c) Adjust landing gear toe-in.

d) Install and remove aircraft wheel and brake assemblies.

e) Install tubes and tires.

f) Protect aircraft tires from hydraulic fluids.

g) Service brake boosters.

h) Service landing gear shock struts.

i) The effects of increasing temperature on "parked" brakes.

j) Determine the cause of an oleo strut bottoming during taxi operations.

k) The pressure source for actuating power brakes.

l) Select and install air valves in oleo shock struts.

m) Observe safety precautions when demounting tire and wheel assemblies.

n) Determine if a brake system requires bleeding; perform brake system bleeding.

o) Inspect and adjust multiple-disc brakes.

p) Install new linings in hydraulically operated single-disc brakes.

School _____ Date _____

Principal _____

q) Determine the cause of spongy brake action.

r) Inspect and service aircraft tires and tubes.

s) Determine the reason for "dragging" brakes.

t) The method of equalizing braking pressure on both sides of the rotating disc of a single-disc brake.

u) Operate and check retractable landing gear.

v) Determine the cause of fading brakes.

w) Replace actuating cylinders.

x) Install brake blocks in an expander-tube brake assembly.

y) Inspect brake drums.

z) The purpose and function of metering pins in oleo shock struts.

aa) Determine the cause of excessive brake pedal travel.

bb) The operating principles of oleo shock struts during landing.

cc) The storage requirements for aircraft tires and tubes.

dd) The effect of a broken return spring in a brake master cylinder.

ee) Determine the cause of grabbing brakes.

ff) The purpose and operation of a debooster in a hydraulic power brake system.

gg) Detect internal leakage in a brake master cylinder.

hh) The operating principles of servo, expander-tube, multiple-disc, and single disc aircraft brakes.

ii) The purpose and operating principles of brake master cylinders.

School _____ Date _____

Principal _____

Written examination required and practical project.

1) A complete brake system overhaul, installed on aircraft.

2) Perform a tire change and service.

3) A landing gear retraction check, including system inspection and adjustment.

4) Overhaul and service an oleo shock strut assembly.

5) Check and service a power brake system in accordance with manufacturer's specifications.

B. HYDRAULIC AND PNEUMATIC POWER SYSTEMS (11th, 12th Year and RT)

1. Repair hydraulic and pneumatic power system components (Level 2)

a) Install packing seals and rings on hydraulic components.

b) Determine the correct seal type to use with ester-base, petroleum-base and vegetable base fluids.

c) Remove and install hydraulic selector valves.

d) Remove and install a spool-type or balanced-type pressure regulator.

e) Determine the cause of excessive oil in an aircraft pneumatic system.

f) The operating principles of a pneumatic power system multi-stage reciprocating compressor.

g) Identify hydraulic seals and packing.

h) Protect packing rings or seals against thread damage during installation.

School _____ Date _____

Principal _____

A written test is required. The practical projects are:

1) Remove, disassemble, inspect and reassemble various types of hydraulic units and reinstall in system.

2. Identify and select hydraulic fluids (Level 3)

a) Determine the fluid type for use in a specified aircraft hydraulic system.

b) The method of measuring the viscosity of a liquid.

c) Identify ester-base, petroleum-base, and vegetable-base fluids.

A written test is required. The practical project is:

1) Service aircraft hydraulic system with fluid in accordance with maintenance manual.(Students will identify the type of fluid used on a specific aircraft or mock up)

3. Inspect, check, service, trouble shoot and repair hydraulic and pneumatic power systems (Level 3)

a) Determine the air pressure in a hydraulic accumulator.

b) The location and use of quick-disconnect fittings in hydraulic and pneumatic systems.

c) The mounting position of diaphragm and bladder type hydraulic accumulators.

d) Service hydraulic reservoirs.

e) Determine the causes of incorrect system pressure.

School _____ Date _____

Principal _____

f) Service porous paper and micronic filter elements.

g) Adjust the pressure setting of the main system relief valve.

h) Purge air from the hydraulic system.

i) The term used to indicate force per unit area.

j) Identify the types of hydraulic power systems.

k) The purpose, location, and operation of a hydraulic fuse.

l) Protect a hydraulic system against contamination during a component replacement.

m) Inspect a hydraulic system for water and metal contamination.

n) Service a pneumatic system moisture separator.

o) The purpose, location and operation of an orifice check valve in the wing flap actuating system.

p) The purpose, location, and operation of a wing flap overload valve.

q) The purpose, location, and operation of a hydraulic system pressure regulator.

r) The purpose, location and operation of a sequence valve.

s) The purpose, location and operation of a cross flow valve.

t) The purpose, location and operation of a hydraulic system accumulator.

u) The purpose, location and operation of a shuttle valve.

v) The purpose, location and operation of a check valve.

w) Install and remove hydraulic engine driven pumps.

x) The indications of a worn or damaged hydraulic pump shaft.

School _____ Date _____

Principal _____

y) The operating principles of hydraulic hand pumps.

z) The cause of hydraulic pump chatter during operation.

aa) The operating principles of a constant displacement hydraulic pump.

bb) The operating principles of a variable displacement hydraulic pump.

cc) The purpose of the shear section on the shaft of an engine-driven hydraulic power pump.

dd) The purpose and operation of a hydraulic actuating cylinder.

ee) Determine the cause if a constant pressure hydraulic system with no external leakage will not hold pressure when the power pump is not operating.

ff) Determine the cause if an engine driven power pump will not maintain system pressure during the actuation of a unit in the system.

gg) The general features and operating principles of aircraft pneumatic power systems.

hh) The purpose of pressurized reservoirs in some hydraulic systems.

ii) The purpose and location of a stand pipe in some hydraulic systems.

jj) The cause of too frequent cycling of a constant-pressure hydraulic system.

kk) Operate and check a hydraulically operated flap system.

ll) The operating mechanism of most hydraulic pressure gauges.

mm) The indications of a low fluid supply during system operation.

_____ School _____ Date

_____ Principal

A written test is required. The practical projects are:

1) Connect a hydraulic A.P.U. to the aircraft hydraulic system. Check operation.
2) Adjust hydraulic system pressures on a constant pressure type system.
3) Adjust hydraulic system pressures on an open center hydraulic system.
4) Install and service hydraulic system accumulators.
5) Trouble shoot a malfunction in a hydraulic system or component.
6) Inspect and service hydraulic filters and reservoirs.
7) Install and remove various hydraulic system components such as engine driven pumps, hand pumps, actuators, check valves, filters, selector valves and pressure gauges.

C. CABIN ATMOSPHERE CONTROL SYSTEMS (12th Year and RT)

1. Repair heating, cooling, air-conditioning, pressurization, and oxygen system components (Level 1)
   a) The usual reasons a surface combustion heater fails to operate.
   b) The effects of cracks or holes in an exhaust-type heat exchanger.
   c) The usual sources of contamination of a freon system.
   d) The method of protecting a freon system from contamination during replacement of a component.

Written examination required.

_____ School _____ Date

_____ Principal

2. Inspect, check, troubleshoot, service, and repair heating, cooling, air conditioning, and pressurization systems. (Level 1)

   a) The operating principles of a thermostatically controlled surface combustion heater.

   b) The methods used to control cabin pressure of a pressurized aircraft.

   c) The protective features included in the control circuits of surface combustion heaters.

   d) The purpose and operation of check valves in the delivery air ducts of a pressurization system.

   e) The basic principles of providing and controlling aircraft pressurization.

   f) The inspection requirements of cabin heating systems that utilize and exhaust heat exchanger as a source of heated air.

   g) The method of checking a combustion heater fuel system for leaks.

   h) The function of the condenser in a freon cooling system.

   i) The function of the evaporator in a freon cooling system.

   j) The function of an expansion valve in a freon cooling system.

   k) The location, in relationship to each other, of the units in a freon cooling system.

   l) The method of determining the liquid level in a vapor-cycle cooling system.

   m) The procedure for servicing a vapor-cycle air conditioning system that has lost all its freon charge.

   n) The basic operating principles of an air-cycle cooling system.

School Date

Principal

o) The function of a jet pump in a pressurization and air-conditioning system.

p) The function of a mixing valve in an air-conditioning system.

q) The function of the negative pressure relief valve in a pressurization system.

r) The function of the outflow valve in a pressurization system.

s) The function and principles of operation of an automatic cabin rate-of-climb control system.

Written examination required.

3. Inspect, check, troubleshoot, service and repair oxygen systems (Level 2)

a) Check oxygen system for leakage.

b) Service oxygen system with breathing oxygen.

c) Inspect a breathing oxygen system for contamination.

Written examination required and the practical project:

1) Check an oxygen system for leakage and service the system.

D. AIRCRAFT INSTRUMENT SYSTEMS (12th Year, RT)

1. Install instruments (Level 1)

a) The installation and connection of shock-mounted vacuum instruments to their power system.

b) The types of hardware used to install instruments.

_____ School _____ Date

_____ Principal

c) The application of operation markings to the glass face of an aircraft instrument.

d) The protection of instruments during handling.

e) The installation practices necessary to prevent damaging an instrument.

f) The installation practices used in making hose or tubing connections to the instruments.

Written test required.

2. Inspect, check, service, troubleshoot, and repair heading, speed, altitude, time, attitude, temperature, pressure and position indicating systems. (Level 1)

a) The procedure for "swinging" an aircraft magnetic compass.

b) The methods used to test a static air system for leakage.

c) The significance of various types of marks on the face of an instrument.

d) The operating principles of a thermo-couple temperature-indicating circuit.

e) The service requirements of instrument system filters.

f) The effect of a ruptured or disconnected static pressure line located inside a pressurized cabin.

A written test required.

School _____ Date _____

Principal _____

E. COMMUNICATION AND NAVIGATION SYSTEMS (12th Year and RT)

1. Inspect, check and service auto pilot and approach control systems (Level 1)

   a) The operating principles of the sensing device used in an autopilot system.

   b) The purpose and operation of the autopilot.

   c) The purpose of a servomotor in an autopilot system.

   d) The installation requirements for autopilot units.

   e) The function of a position transmitter in an autopilot system.

   Written examination required.

2. Inspect, check, and service aircraft electronic communication and navigation systems. (Level 1)

   a) The FCC regulations pertaining to the operation of two-way radio.

   b) The principal conditions which must be considered in the installation of radio.

   c) The protection of radio equipment from shock and vibration.

   d) The methods of reducing engine noise in radio receivers.

   Written examination required.

3. Inspect and repair antenna and electronic equipment installations (Level 2)

   a) The preferred location and methods of mounting external antennas.

   b) The procedure for returning an aircraft to service after a radio installation has been made in accordance with approved installation data.

_____ School _____ Date

_____ Principal

c) The preferred location for the VOR localizer receiver antenna on a small aircraft.

Written examination required and the practical projects.

1) Install a LF antenna on aircraft.

2) Install a VHF antenna to mast.

3) Inspect the installation of radio equipment and racks in aircraft for conformance with approved installation data.

F. AIRCRAFT FUEL SYSTEMS (12th Year, RT)

1. Check and service fuel dump systems (Level 1)

a) The reasons for requiring fuel dump systems.

b) The methods used to control the operation of fuel dump chutes and valves.

c) The principal safety requirements for a fuel dump system.

d) The purpose of jettison pumps in fuel dump systems.

Written test required.

2. Perform fuel management, transfer, and defueling (Level 1)

a) The precautions required when defueling an aircraft.

b) The tank-to-engine combinations possible with a crossfeed system.

School Date

Principal

c) The method of maintaining C.G. limits using fuel transfer technique.

d) The arrangement of fuel system controls, indicators, and warning lights.

Written test required.

3. Inspect, check, and repair pressure fueling systems (Level 1)

a) The method of controlling fuel level during pressure fueling operations.

b) The methods used to operate fueling valves.

c) The protection of inegral tanks against overpressure during pressure fueling operations.

d) The arrangement of fueling system controls, indicators, and warning lights.

e) The precautions required when fueling an aircraft.

f) The purpose and operation of pilot valves.

Written test required.

4. Repair aircraft fuel system components (Level 2)

a) Repair and seal fuel tanks.

b) Pressure test fuel tanks.

c) Remove and clean fuel strainers.

d) The precautions to follow when routing fuel lines.

e) The method of regulating fuel system pressure.

Written test required. Practical project included in Item 7.

School _____ Date _____

Principal _____

5. Inspect and repair fluid quantity indicating systems (Level 2)

   a) The methods used to determine the level of fluid in a tank.

   b) The purpose of remote-reading electrical gauges.

   c) Calibrate liquidometer-type fluid quantity indicating systems.

   d) The effect of aircraft attitude on fluid level measuring devices.

   Written test required. Practical project included in Item 7.

6. Troubleshoot, service, and repair fluid pressure and temperature warming systems (Level 2)

   a) Determine and adjust the pressure or temperature at which warning systems operate.

   b) Determine the cause of incorrect warning system indications and make corrections.

   Written test required. The practical projects are:

   1) Correct malfunction in fuel pressure warning system.

7. Inspect, check, service, trouble shoot, and repair aircraft fuel systems (Level 3)

   a) The fuel system inspection requirements for aircraft operating in areas of high humidity or wide temperature ranges.

   b) The design and installation requirements for aircraft fuel tanks.

   c) The maintenance requirements of fuel tank sumps.

   d) The marking requirements for fuel filler openings.

School Date

Principal

e) The purpose of potassium dichromate in a fuel system.

f) The reason for using booster pumps with engine-driven pumps.

g) The purpose of baffle plates in fuel tanks.

h) The installation and operation requirements of fuel valves.

i) The venting requirements of interconnected fuel tanks.

A written test is required. The practical projects are:

1) Repair and check fuel tank strainers.

2) Install a fuel pump, pressure check fuel lines and adjust pressure.

3) Check and service fuel quantity indicators installed in aircraft, in accordance with maintenance manual.

4) Perform a daily inspection of a fuel system.

5) Replace and check firewall shut-off valve, selector values, linkages and handles.

6) Install and check a fuel booster pump.

7) Check, service and trouble shoot a fuel tank vent system.

8) Service aircraft fuel system with proper grade of fuel.

G. AIRCRAFT ELECTRICAL SYSTEMS (10th, 11th, 12th Year and RT)

1. Repair aircraft electrical system components (Level 2)

a) Use a "growler" in generator and motor armature inspection and repair.

b) Check the condition of shunt and compound generator field circuits.

School

Principal

c) Locate and use overhaul information for electrical equipment.

d) The procedures for correcting generator brush arcing.

e) Dress or turn the commutator surface of a motor or generator armature.

f) Flash a generator field.

g) The effect of changes in speed and load on generator output.

h) The function of a commutator in a direct current electric motor.

i) Seat new or replacement generator brushes.

j) The effect of incorrect generator brush spring tension on generator operation.

k) The methods of reducing armature reaction in aircraft generators.

l) The operating principles of carbon-pile voltage regulations.

m) The design factors that determine the number of cycles-per-revolution an alternating current generator will produce.

n) Determine the speed (r.p.m.) of an electric motor.

o) The basic principles of generators.

p) The factors that affect the torque produced by an electric motor.

q) The methods used to protect armature shafts from overloads.

r) The speed and load characteristics of series-, compound-, and shunt-wound motors.

s) The means employed to control current and voltage output of aircraft generators.

t) The methods used to control output frequency and voltage of alternating current generators.

School Date

Principal

u) The general operating characteristics of vibrator-type current and voltage regulators.

v) The purpose and operation of reverse-current cutout relays in generator control circuits.

w) The basic internal electrical circuits of series-, compound-, and shunt-wound generators.

x) The operating principles of magnetic clutches and brakes commonly used with electric motors.

y) The purpose and operation of reversible electric motors.

Written examination required and the practical projects:

1) Disassemble, inspect, repair as necessary, assemble and test an aircraft D.C. generator.

2) Service a D.C. generator regulating system.

3) Disassemble, inspect, repair as necessary, assemble and test an aircraft D.C. motor which incorporates a "brake" system.

2. Install, check, and service airframe electrical wiring, controls, switches, indicators, and protective devices (Level 3)

a) The purpose, applicability, and operation of electrical fuses and circuit breakers.

b) The types and operation of electrical switches.

c) Install and wire electrical switches.

d) Splice wiring in aircraft electrical systems.

e) The characteristics of high tension and low tension electrical wiring.

School

Principal

f) The purpose, applicability, and use of electrical wiring terminal strips.

g) The criteria for selecting aluminum and copper electrical cables.

h) Replace terminals on aircraft aluminum and copper electrical cables.

i) Determine the current-carrying capacity of an electrical circuit.

j) The installation and maintenance of open wiring electrical systems.

k) Install electrical wiring in conduits.

l) The method of protecting electrically operated emergency systems from accidental actuation.

m) The strength requirements for electrical cable terminals.

n) Select and install electrical bonding jumpers.

o) The installation requirements for electrical junction boxes.

p) The characteristics of single-wire electrical systems.

q) The special requirements an electrical bonding jumper must meet if it is required to carry a ground load for a unit of electrical equipment.

r) The purpose of shielding electrical wiring and equipment.

s) The use of quick-disconnect electrical plugs and sockets.

t) The purpose of static wicks or dischargers.

u) The American Wire Gage (A.W.G.) system of designating electrical wire sizes.

_____ School _____ Date

_____ Principal

Written examination required and the practical projects:

1) Install a single-wire navigation light system.

2) Install a two-wire aircraft landing light system.

3) Install electrical wiring in a conduit and junction box using a quick disconnect plug.

4) Set the limit switches that control the position or limits of motion of electrically operated flaps, landing gear retraction, or similar systems.

5) Inspect and test bonding system connections with ohmmeter including static wicks.

3. Inspect, check, troubleshoot, service and repair alternating current and direct current electrical systems (Level 3)

   a) The results of short or open circuits in a generator control circuit.

   b) The effect of sticking points in a reverse-current cutout relay.

   c) The cause and effect of solenoid switch chatter.

   d) The installation and circuit requirements for anticollision light systems.

   e) The installation and circuit requirements for position lights.

   f) The method of providing direct current for battery charging on aircraft that operate only alternating current generators.

   g) The common methods of controlling output current and voltage of compound direct current generators.

   h) The operating principles and characteristics of inverters.

School _____ Date _____

Principal _____

i) Determine the output frequency of an alternating current generator.

j) The operating principles and characteristics of rectifiers.

k) The method of providing alternating current in aircraft that operate only direct current generators.

l) The electrical device usually used to convert alternating current to a lower or higher voltage without a change in frequency.

m) The operating principles and characteristics of electrical induction coils.

n) The operating principles and characteristics of transformers.

o) The advantages of using alternating current in aircraft.

Written examination required and the practical projects:

1) Locate and correct a malfunction in a D.C. electrical system.

2) Locate and correct a malfunction in an A.C. electrical system.

3) Check reverse current relay settings.

4) Check and correct malfunction in a battery charging system.

5) Check the output of generator-operated electrical system.

School _____ Date _____

Principal _____

H. POSITION AND WARNING SYSTEMS (11th, 12th Year and RT)

1. Inspect, check and service speed and take off warning systems, electrical brake controls and antiskid systems (Level 1)

   a) The general requirements for installing skid detectors.

   b) The operating principles of hydraulic brake antiskid systems.

   A written test is required.

2. Inspect, check, trouble shoot, service and repair landing gear position indicating and warning system (Level 3)

   a) Determine the cause of a gear unsafe warning signal.

   b) The effect of various electrical faults in the operation of the landing gear warning system.

   A written test is required. The practical projects are:

   1) Locate defective micro switch in landing gear position indicating system.

   2) Correct inoperative warning horn in gear position indicating system.

I. ICE AND RAIN CONTROL SYSTEMS (12th Year and RT)

1. Inspect, check troubleshoot, service, and repair airframe ice and rain control systems (Level 2)

   a) Install deicer boots.

   b) The operating principles of anti-icing systems that utilize heated air in the leading edges of airfoils and intake ducts.

School _____ Date _____

Principal _____

c) The operating principles of electrically operated anti-icing systems.

d) Protect de-icer boots from deterioration.

A written test is required. Practical projects:

1) Check pilot tube heater.

2) Check the installation and operation of installed de-icer boots.

3) Inspect and service the air/oil separator in a vacuum system.

J. FIRE PROTECTION SYSTEMS (12th Year and RT)

1. Inspect, check and service smoke and carbon monoxide detection systems (Level 1)

a) The operating principles of smoke and carbon monoxide detection systems.

A written test is required.

2. Inspect, check, service, trouble shoot, and repair aircraft fire detection and extinguishing systems (Level 3)

a) The type of fire extinguishing agent most suitable for use with electrical fires.

b) The fire extinguishing agent normally used with built-in aircraft fire extinguishing systems.

c) Check fire extinguisher container pressure.

d) Check continuity and resistance of the electrical circuit.

School Date

Principal

e) Determine the cause for the system failing function.

f) Check fire warning sensors or detectors for open or short circuits.

A written test is required. The practical projects are:

1) Locate and replace a defective thermal sensor.

2) Check quantity of fire extinguishing agent available in the system.

3) Make operational check of circuits used to actuate a built-in fire extinguishing system.

AIRFRAME MAINTENANCE TECHNICIAN INSTRUCTIONAL FACILITIES

The following is a brief description of the airframe facilities.

All shops are equipped with suitable arrangements for the storing of materials, tools, and equipment. Suitable and separate space is provided for wash tanks, de greasing, air pressure and other cleaning equipment. In addition, other specialized equipment applicable to the subject being taught is provided. All of the facilities are properly heated, lighted, and ventilated.

INSTRUCTIONAL EQUIPMENT

The Airframe curriculum provides the following instructional equipment consisting of training aids, visual aids, and mock-ups appropriate to the course.

1. Hydraulic Training Aids:
   a) Aileron boost systems.
   b) Landing gear actuating system.
   c) Various types of brake systems.
   d) Open and closed center systems.

2. Electrical Mock-ups
   a) D.C. generator and generator control systems.
   b) A.C alternator system.
   c) Junction mock-up.
   d) F-84 electrical system mock-up.

3. Various types of wing sections, fuselages, control surfaces and tab systems.

4. Aircraft (complete)
   a) 7 North American (SNJ-AT6)
   b) 1 Sikorsky S-51 Helicoptor
   c) 1 Stearman (Boeing PT-17)
   d) 2 Beechcraft (D-18, CAS)
   e) 1 Lockheed (T-33, TV-2)
   f) 1 Aeronca (K)

DESCRIPTORS - *VOCATIONAL EDUCATION; SUPPLEMENTARY TEXTBOOKS; *RESOURCE MATERIALS; *DRAFTING; *DRAFTSMEN; SECONDARY EDUCATION; INDUSTRIAL ARTS; *TRADE AND INDUSTRIAL EDUCATION

ABSTRACT - Developed by drafting instructors in the Milwaukee Public Schools in cooperation with a curriculum advisory committee, this curriculum supplement is a collection of individual resource units including bibliographies for use in junior high and high schools. The publication, designed to assist instructors of drafting, presents current industrial practices which include: (1) Levels of Drafting Occupations, (2) Kinds of Drafting Activities, (3) Standards, (4) Documentation, (5) Engineering Drawing Changes, (6) Dimensioning, (7) Drawing Media, and (8) Microfilming. For the convenience of instructors who might experience difficulty in securing prints from industry, various industrial prints are appended. (LM)

ACKNOWLEDGMENT

The material covered in this publication has been selected in cooperation with the Curriculum Advisory Committee for Drafting, and the content of this and other identified resources has been developed with their assistance.

The writing has been accomplished as a joint effort by Agner Andersen, Gerald DeLeeuw, Rowland Morrison, and Donald Strube--all of whom are instructors of drafting in the Milwaukee Public Schools.

8351

INTRODUCTION

This material has been developed in an effort to assist instructors of drafting within the Milwaukee Public Schools in areas of current drafting-room practice for which their individual backgrounds and/or coverage in texts is inadequate to provide for meaningful instruction. This is a supplement to the existing curriculum guide and is not intended for student use. Since this is not intended as a text, but rather as a series of individual resource units in one binding, individual bibliographies are incorporated as a part of each unit rather than as a part of the total publication.

Current industrial practice is presented in a concise, authoritative way. At the same time, attention is called to as many resource materials as can be identified in each subject area which will, in turn, facilitate the development of an expanded resource library.

Proficiency in all of these areas is not necessarily the objective. In many cases, no more is desired than a sense of awareness that a given activity is currently being used in industry.

LEVELS OF DRAFTING OCCUPATIONS

Every industry has its own set of job titles, and each individual industry may assign different activities to persons holding the same or similar titles. In view of these facts, it is not possible to set forth a firm list of job titles or the kinds of activities in which persons having a particular responsibility are engaged. The descriptions outlined below are no more than examples of what might be. Individual instructors are encouraged to invite resource persons from several industries into their classes to discuss the table of organization, job description, employment requisites, etc., typical of their companies.

The Draftsman Trainee

The trainee works under the close guidance and direction of other draftsmen or supervisory personnel. His assignments are selected and varied according to individual competence so as to develop his skills in the acquisition and application of drafting techniques.

The trainee acquires basic knowledge and skill through assignments in a short, formalized training program and/or by working directly on assignments in a specific department. He learns and applies fundamentals of drafting under immediate supervision. Included are dimensioning, development of detailed views, cross-sections of major units, and preparation of tables and production drawings. The major portion of a trainee's time is spent effecting changes on existing documents, as this permits him to adapt to company standards and familiarizes him with the product.

Qualifications for training programs usually specify a high school diploma or its equivalent, with specialization in drafting, mathematics, and science.

8355

8354

The Draftsman

Work as a detailer may be the first opportunity a draftsman has to make decisions relative to design. His primary function is to prepare detail drawings for manufacture. This would include:

- -- Preparing parts drawings
- -- Working from layout drawings
- -- Working from explicit instructions by engineer or layout draftsmen
- -- Revising drawings - bills of material
- -- Incorporating revisions of design
- -- Preparing bills of material

The draftsman utilizes the best practical language for communicating an engineer's, designer's, or architect's ideas to the workmen who, in turn, transform them into reality. His work requires skill in applying drafting techniques along with a practical knowledge of engineering and production procedures.

The Layout Draftsman

The layout draftsman proves out the product design on drawings using prior layouts, sketches, models, and verbal instructions. As a layout draftsman, he also supervises and aids detail draftsmen and works with designers on new and special products.

The Designer or Senior Draftsman

The designer or senior draftsman typifies the peak of the producing draftsman. Not only does he use skills acquired over the years and contribute to the design of the finished product, but he exercises personal leadership in directing those working under him.

8355

Checkers

Checkers are experienced draftsmen who verify and examine all finished drawings to insure accuracy, completeness, and manufacturing efficiency. They must certify the correctness of documents before they may be released. To qualify, checkers must:

-- Be familiar with manufacturing practices in the industry

-- Be well trained in drafting and manufacturing standards

-- Have experience similar to that required for senior draftsmen or designers

-- Be able to suggest modifications to correct errors in design and recommend changes which will facilitate production

8356

KINDS OF DRAFTING ACTIVITIES

Engineering Drafting

Engineering is an applied science involving the complete and accurate communication of physical facts. Quantitative relationships may be expressed mathematically, while the written word completes many descriptions. But whenever machines and structures are designed, described, and built, graphic representation is necessary. Although the works of artists (or photography and other methods of reproduction) provide pictorial representation, they cannot serve as engineering descriptions.

Engineering drawings express pure engineering intent but do not show how manufacturing is to be accomplished. Shaded pictorial drawings and photographs are used for special purposes, but the great bulk of engineering drawings are made in line only, with separate views arranged in a logical system of projection. Drawings which specify operations and other directions for manufacture are process drawings and are often produced in a production engineering department. This is the language of engineering drawing, which can be defined as the graphic representation of physical objects and relationships.

Electrical Drafting

Drawings for electrical machines, details, fixtures, apparatus, and related construction are based upon the same basic principles of orthographic projection and dimensioning as for all other drafting. However, electrical and electronic drafting has to do with drawings which show circuits or wiring diagrams. These circuits must be planned by the electrical design engineer. Sketches form an important part of the design studies from which draftsmen work.

Various types of diagrams and a great number of graphic symbols are used to show the different parts or components of a system--where they are located and how they are connected to serve the required purpose.

8357

Electrical drafting requires a basic knowledge and understanding of circuitry in addition to the ability to make drawings. Therefore, one should seek to learn about circuitry and how it behaves as well as about the materials, tools, and processes used in electrical work.

Architectural Drafting

The general principles of drawing are the same for all kinds of technical work. However, architectural drawings usually reveal a more spontaneous approach to drawing problems than that shown in other fields of engineering. The preparation of preliminary studies, presentation drawings, building models, and architectural working drawings requires various techniques and drawing skills. Thus, an architect--even more than his fellow engineers--must be able to draw both freehand and with instruments, using all the materials and techniques at a draftsman's disposal.

The combined art and science of building structures, especially the art of building houses, churches, bridges, and the like, is properly placed (professionally) between engineering and the fine arts. Architectural designing is that phase of architecture based primarily upon study of the fine arts, but architects must understand structural engineering requirements.

Structural Drafting

Structural drafting has to do with the drawings made for the framework and supporting members of structures such as columns, floor members, roof trusses, bridge trusses, and the great variety of construction work made from structural-steel shapes and plates. The design of structures requires a knowledge of the many subjects included in structural engineering, such as mathematics, stresses, mechanics, properties of materials, methods of fabricating, and methods of erection.

8329

8358

Map Drafting

Maps are essentially one-view drawings of a part of the earth's surface. Some maps having to do with the ownership of property, such as city plats, must be extremely accurate--particularly as to data noted on the map. The scale is relatively large (50 to 200 feet to the inch). Geographic maps of states or countries which show boundary lines, streams, lakes, coastlines, and relative locations may use a scale of several miles to the inch.

These represent only a portion of the types of drawings. Many others are in common usage in industry and should be understood by the student of drafting. Included would be piping diagrams, interface control drawings, matched parts, inseparable assembly, and purchase part drawings. An excellent single source for definitions is MIL-STD-100A, as noted in the bibliography for this unit.

8359

TYPE AND LENGTH OF TRAINING PROGRAMS FOR DRAFTSMEN

(As Developed by Typical Milwaukee Companies)

Company	Type of Training
Allen-Bradley	Four-Year Apprenticeship
Bucyrus-Erie	Three-Year Apprenticeship
Chain Belt	Three-Year Apprenticeship
City of Milwaukee Civil Service Commission	Draftsman I - Two Years (Or less if able to pass promotional examination)
	Draftsman II - Two Years (Or less if able to pass promotional examination)
	Draftsman III
Cutler-Hammer	Trainee
Evinrude	Four-Year Apprenticeship
Falk	Three-Year Apprenticeship
Globe-Union	Three-Year-Apprenticeship
Harnischfeger	Two-Year Apprenticeship
Johnson Service	Three-Year Apprenticeship
Kearney and Trecker	Three-Year Apprenticeship
Ladish	Three-Year Apprenticeship

STANDARDS

What are standards? Webster says they are ". . . established by authority or general consent; that which is proper and adequate for a given purpose."

Standards relate to people as well as things. Requirements for teacher certification are a form of standard, as are eligibility requirements for the athlete and graduation requirements for the student. Many technical jobs screen applicants by carefully-written job specifications. Standards define a product, process, or procedure with reference to nomenclature, composition, construction, dimensions, tolerances, safety, operating characteristics, performance, quality, rating, testing, and the service for which designed.

Standards serve the needs of designers and control variety. They cover materials, engineering practices, processes, codes, symbols, nomenclature, and include some phases of marketing. Inadequate standardization could result in complications in procurement and production, as well as in significantly greater costs. Today's standards become obsolete as old problems are solved, as new ones arise, and as new products and processes come into use. Thus, a continual process of reappraisal, rejection, and modification is required.

Perhaps the most universal standard deals with measurement. Scientists throughout the world use the metric system of weights and measures. Many American industries employ both systems, the inch and the meter, because of the demands of customers or the nature of their product. For this reason students must have an accurate understanding of the metric system of weights and measures. A more complete discussion of metrics will be found in the unit on dimensioning.

Because of the fact that common fractions do not lend themselves to the degree of accuracy which is demanded of our industrial society and, because they cannot be converted to meters, industry has ceased using them and has adopted decimals. The facts that most nations of the world measure in meters,

8363
8362

and that industry measures with decimals clearly indicate that students must learn to think in terms of and work with decimals.

As students progress through their learning experiences in mathematics, they acquire an understanding of fractional parts, or what the layman thinks of as common and decimal fractions. Because it is necessary for the student to learn to think in terms of decimals, rather than thinking common fractions and converting to decimals, it would appear desirable to talk in terms of "decimals" rather than "decimal fractions," even though the latter term is correct mathematically. It is interesting to note that teachers of mathematics find students, particularly those who are less capable, able to more effectively apply concepts developed around decimals than those oriented to common fractions.

It is unnecessary for the student of drafting to know a great amount of detail about many kinds of standards, but he must understand that no one in the broad field of drafting works with complete freedom. He should, however, know where and how to research standards and understand their place in the profession.

Equipment standardization is usually limited to features which insure interchangeability, compatability, operational characteristics, and the use of standard parts. Consequently, these will not necessarily result in items identical in appearance or design, but only in conformation to space allocation, interchangeability, common operational characteristics, etc.

Are standards really necessary? Couldn't we get along without them? Consider that, less than one hundred years ago, every community established its own time, as did each railroad system. Imagine the chaos encountered in attempting to plan a trip which might involve a change from one railroad to another, compounded by meetings in cities along the way. Yet, it took twenty years for the American Railway Association to adopt the standard time zones of today, and even longer for the communities in the country to follow this lead.

8363

Industry agrees that the savings which standards make possible far outweigh the cost of developing them. One estimate indicates that every dollar spent on standards will effect at least a three-dollar saving in design and production. Imagine the cost in man-hours alone if each automobile manufacturer had to carefully spell out the composition of each piece of steel, cast iron, aluminum, glass, rubber, plastic, wire, and fabric used. Compound this with specifics of sizes, tolerances, and cost considerations for tooling and limited production runs.

Every manufacturer in the United States knows that a tap made in the East will thread a hole to accept a screw cut in the West; that a nut produced in the South will fit, within the prescribed tolerances, a matching bolt made in the North. He knows that a given grade of steel, regardless of the producer, will have certain characteristics, and that the ingredients used in alloying the steel will also have been produced under and will have met prescribed standards.

What kinds of standards are there?

COMPANY STANDARDS are those adopted by any corporation for its own use. These may, of course, include many things. Restricting examples to the drafting room, company standards might include the sizes of sheets, the numbering system, the style and height of lettering, design data, and the number of details on a single sheet.

INDUSTRY STANDARDS, as the name implies, are those adopted for use within an industry. These are most often the outgrowth of activities within a trade association, and these standards are oftentimes incorporated, in whole or in part, into national standards. Typical of groups developing industry standards are: American Concrete Institute, American Institute of Architects, American Petroleum Institute, American Welding Society, and the Society of Automotive Engineers.

NATIONAL STANDARDS are usually developed as the result of the cooperative efforts of several groups under the coordination of the USASI (United States

DOCUMENTATION

A document is, by definition, any instrument which conveys information, and documentation is the information itself. For the purposes of the draftsman, the word documentation refers to the actual drawing as well as supporting parts lists, bills of materials, standard hardware lists, and all other supporting materials. Documentation can further be defined as configuration management which is: 1) identification (product definition); 2) control; and 3) processing and verification. The engineering documentation is that which supports the drawing, such as specifications, bills of material, or parts lists which identify the design. The manufacturing documentation is the paper work supporting the drawings involved in the manufacture of the product. Data process runs, manufacturing drawings, test runs, process sheets, operation sheets, etc., would be included in this definition.

The two areas having a somewhat different definition of documentation also have somewhat different uses. Engineering concerns itself with the design and development of a product, while manufacturing documents indicate the specifics related to manufacture.

Manufacturing may require a change in the document so that parts may be produced or purchased in a more economical way. Parts may be altered or change orders issued which will make the document more adaptable to the use of computerized or data-controlled processes. Computerized bills of material, parts lists, etc., are used by almost all commercial industries. Even smaller and commercially-oriented (not just the large military contract type) industries use computer-developed information in the preparation of drawings. The cost of computer and data processing equipment is lessened through time-sharing. This is a system which permits several companies to share in the use of and derive the benefits from a computer. None of these individual companies would have enough work to keep the computer busy and, therefore,

8368 8368

could not justify the expense involved. These new processes have the effect of taking much data off the drawing itself and putting it onto supporting documents.

The commonly accepted practice is to put as few notes on a drawing as possible and to use more symbols--the language of the newer method--thus reducing the need for notes. Notes can be typed on supporting documents quickly and are easier to revise; symbols require less time to comprehend, are less likely to be misinterpreted, and require less time for revision. Typical examples are to be found on pages 45-52.

Hardware catalogs, manufacturing specification sheets, and material supply catalogs are a source of reference for the student. He should become acquainted with them and their use by the draftsman. The general types of detail drawings such as electrical, mechanical, welding, structural, manufacturing, purchased parts, schematics, and assembly should be shown by example and with problems in all of these areas. Multi-detail drawings are used primarily for single- or low-production runs whereas mono-detail drawings are now commonly used in industry for high production. Size of the component is not significant. Anticipated production is the determining factor.

Types of Drawings

There must be as many different types of drawings as there are things to be drawn. The two largest fields involved with particular types of drawings are construction drawings for the construction industries and product drawings for the manufacturing industries.

CONSTRUCTION DRAWINGS are used in the design of buildings, structures, and their related construction and are normally associated with architectural or civil engineering operations. Construction drawings include plan drawings, elevation drawings, erection drawings, and plot (plat) plan drawings. They do not normally include sketches, perspectives, and presentation drawings.

8368 8369

Plan drawings depict horizontal projection of a building or structure showing the layout of the foundation, floors or specific levels, and roof. The plan drawing shall show shapes, sizes, and materials; the relationship between the different plan drawings and the location of walls, bulkheads, stanchions, columns, openings, stairs, skylights, ventilators, parapet walls, drainage, etc. It may include or require separate drawings for services depicting individual layouts for heating, plumbing, air conditioning, electrical, and other utility systems. These, again, are individual types of drawings.

Elevation drawings depict vertical projections of a building or structure, showing the profile. Other requirements of plan drawings also apply to elevation drawings.

Erection drawings depict procedure and operation sequence for the erection or assembly of a structure. An erection drawing shows--for each part of the structure--the location, identification markings, types of fastening required, controlling dimensions and any other information that would contribute to the erection of the structure.

Plot (plat) plan drawings depict areas on which structures are clearly indicated with detail information regarding their relationship to other structures, existing and proposed utilities, topography, boundary lines, fences, railroad sidings, roads, walks, etc. A plot (plat) plan drawing shows necessary property lines, building lines, location of structures to be constructed, existing buildings, existing and new utilities, approaches, finish grades, shrubbery, and other pertinent data.

1988 8370

PRODUCT DRAWINGS are used to manufacture and maintain a particular product. Product drawings include detail drawings, inseparable assembly drawings, assembly drawings, control drawings, and diagnostic drawings. Product drawings do not include sketches or layout drawings, although they may be used in the process of creating them.

Detail drawings depict total requirements for a particular part delineated on a drawing. A detail drawing defines all features of a part including configuration, dimensions, tolerances, materials, mandatory processes, surface finishes, protective coatings, etc. Detail drawings can be subdivided into drawing types dependent on the method of fabrication, such as: machined parts, sheet metal parts, gears, castings, forgings, purchased part drawing, etc.

Inseparable assembly drawings depict parts that are fabricated individually and are permanently joined together to form an integral part, such as weldments, etc. The inseparable assembly drawing fully defines the integral part as assembled.

Assembly drawings depict the assembled relationship of two or more parts, a combination of parts and subassemblies, or two or more subassemblies. An assembly drawing contains sufficient views to show the relationship between each part or subassembly that comprises the assembly. Parts on subassemblies shall not be reidentified on the assembly drawing. Assembly drawings contain references to related diagrams and associated lists.

Control drawings depict configuration, requirements, weight limitations, and necessary mounting and connecting attachments to enable the item to be developed or procured on the commercial

8371

market, meeting the stated requirements. Control drawings can be further defined as envelope, specification control, source control, interface control, or installation control drawings.

Diagramatic drawings depict features and relationship of parts forming an assembly or system by means of symbols and lines. A diagramatic drawing is a graphic explanation of the manner by which an installation, assembly, or system performs its intended function. Diagramatic drawings can be further subdivided as electrical or electronic schematic diagram, mechanical or gear schematic diagram, hydraulic schematic diagram, pneumatic schematic diagram, interconnection diagram, piping diagrams, logic diagram, etc.

Satellite Documents (Completing a Set of Engineering Drawings)

A satellite document is any separate document--such as a specification, parts list, process, etc., called out on the drawing by a separate number--required to support the manufacture and maintenance of the item depicted.

In thinking of engineering drawings used to manufacture an item, many persons think of just the drawings. If a bolt is going to be manufactured, visualize a single drawing containing all the information necessary to identify its requirements on the single document--its material, finish requirements, the dimensions, and all other data required to completely identify its parameters.

The same illusion is created when thinking of an assembly drawing--a self-contained document that would call out the necessary assembly instructions plus identify the individual parts, by number, that are in the assembly.

To understand a drawing and what it is used for, this approach and thinking is all right. But, in reality, this is not the way major industries prepare their drawings or define a product.

Drawings are prepared for many purposes other than manufacturing. Some of the other purposes would be design evaluation, logistics support, installation, maintenance, etc. (See Types of Drawings, page 16.)

To completely define an item to be manufactured and supported, many additional documents are prepared. These documents are called satellite documents and are referenced on the individual engineering drawings. Once referenced on the drawing the same rules of control, quality, and maintenance apply to them as to the engineering drawing.

Another reason for preparing a satellite document would be because the information to be placed on the drawing is of such a magnitude that it would be more logical to be on a separate document or because the information to be placed on a drawing is the same information that would be common to many

8380

drawings. Again, this information placed on separate documents and called out on the drawings has the same importance and serves the same purposes as that of a self-contained drawing.

A few examples would help illustrate the above information. Complete descriptions of materials, test instructions, or material finishes are many times too voluminous to call out in their entirety on the face of the engineering drawing, or the material (as an example) is common to many parts and repeating the voluminous information would be time consuming and expensive. In these cases, separate documents would be prepared.

In many companies these separate documents are called "specifications." They, like the drawing, have standards controlling not only the preparation but also the size of the document, format, change block, etc.

Another satellite document commonly prepared by most companies in industry is the parts list or, as some call it, the bill of material. With most companies now using computers to support their operations, preparation of the parts lists by this means is very economical, timesaving, and easy to maintain.

Again, when prepared separately from the assembly drawing this document has a controlled procedure for preparation, format, and change. As stated previously, a complete set of drawings is only complete when all satellite documents called out on the drawings are included in the drawing package and are maintained through a controlled change system the same as the drawing.

ENGINEERING DRAWING CHANGES

The great majority of all drafting room activity is devoted to revisions of existing documents. Such documents include layout, detail, and assembly drawings as well as parts lists, master templates, diagrams, and other documents. Change orders may come about as a result of requests by the customer, manufacturing, purchasing, or engineering. Any of these groups may call for revision even before manufacturing has started.

Management's decision to "stop the presses" must be a wise one. Customer acceptance, product reliability, manufacturing, inventories, service policies, instruction manuals, and other existing items of cost must be considered.

The decision to change a product triggers a review in many areas. Customer interface drawings (documents which affect the design or operation of co-functioning items are used as design control documents for the purpose of establishing and maintaining compatability between planes having a common boundary) of mechanical or electrical requirements might be needed. Such a change might require a layout revision, stress analysis, materials review, and other engineering studies.

After the decision to change has been approved, the change must be controlled. A history of the original design should be kept. This can be done on microfilm before the drawing is changed. An engineering order authorizes the drafting department to incorporate the change. The order is kept as part of the change history.

Management's decision to authorize a change is transmitted to responsible groups by an engineering change order (ECO). Copies are distributed to all groups concerned. Dealer information concerning changes is sometimes distributed by newsletter for information on future sales and service.

8383

During the review of the required changes, all drawing structures for the assemblies in which a part is used are studied. The record of usage is reviewed to determine whether a change will affect an assembly not under consideration. Also, during this review, drawings such as schematic diagrams, electrical wiring drawings, test specifications, and other related data are studied and the necessary changes written. "Related changes" can increase the ECO and drafting work effort by a significant margin. Other documents such as parts lists must also be changed.

When an article must be removed from the shipping line or altered in the field, a retrofit or modification drawing is made. These documents delineate the instructions, parts list, and other necessary information for modifying parts or assemblies to meet new specifications.

At the time of writing an ECO, a person familiar with drafting policies and procedures might review the change order. This action prevents an ECO from describing a change which adversely affects any step in the change procedure.

The drawing of a part is sometimes retained in its original form and a new model or assembly number created. This allows stock and dealer parts to be used, followed by the new model. The new part drawing could be a reproduction of the original part with the required drawing and identification changes incorporated. The process is fast and economical.

When the original drawing is changed, the ECO requirements must be closely followed. Revisions are made by erasure or chemical eradication. History of the change is indicated by a revision statement or ECO number recorded in the revision area of the drawing.

Because the status of change is important to many groups, the time of acceptance is important. The change status of a drawing is identified by a revision letter and date.

8384

New design requirements are distributed to responsible groups through the revised drawings and associated lists. New tooling, parts, and materials are ordered where necessary. If changes require it, time studies and product costs are revised. Assembly procedures must show the new part numbers, tooling setups, and techniques. If required, a break-in point can be part of the ECO. In this case a given quantity or serial number is manufactured using the requirements before the change. After this point the changed part or assembly is made.

From the above information, it is apparent that there is more to an engineering change than simply revising the document. A good, knowledgeable draftsman will not only make the required change as directed by the engineering order but, knowing the impact of a change on his facility, will look for such items as inter-assemblies, etc. Change activity is a very important part of a draftsman's job. Its importance should not be minimized.

In keeping with the amount of time draftsmen devote to this practice, students must have experience making revisions on documents. Since the primary concern is with drawings as opposed to supporting documents, instruction may be accomplished by developing a set of revision and change-order assignments supplementing the required problems. A column should be provided on the drawing for noting revision data.

Specific guidelines for effecting changes on documents prepared for DOD contracts are indicated in MIL-STD-100A. Since many companies hold government contracts this is an excellent reference.

MIL-STD-100A ENGINEERING DRAWING PRACTICES
Chapter 1, Section 5

DIMENSIONING*

Decimal Dimensioning

History and Purpose

The use of decimal notation is inherent to the 10-base numerical system used throughout the civilized world and is employed in the majority of the world's coinage systems. Decimalization is a fundamental practice in the metric system of weights and measures. The decimalized foot was used in land surveying in the United States prior to 1856.

The ability to fabricate parts to a high degree of precision evolved during the industrial revolution of the nineteenth century. It brought about the need for expression of subdivisions of the inch in increments smaller than the 1/64 fraction previously considered to be the smallest practical subdivision of the inch. About the time of the American Civil War, mechanical measurements began to be expressed in terms of thousandths of an inch and this practice was followed closely by the gage maker's need for even smaller increments of one ten-thousandth of an inch. Today, manufacturers are able to produce to accuracies in terms of millionths of an inch.

The use of thousandths and ten-thousandths in combination with the common fractions, however, has created awkward dimensioning and measuring practices which may be overcome by dispensing with the common fractions and going to complete decimalization.

Trend in Industry

A major breakthrough occurred when a decimal inch system for linear measurements was adopted by the Ford Motor Company in 1930. The expanding

*Portions of this unit have been extracted from USA STANDARD DRAFTING PRACTICES, DIMENSIONING AND TOLERANCING FOR ENGINEERING DRAWINGS (USASI Y14.5 - 1966), with the permission of the publisher, The American Society for Mechanical Engineers, United Engineering Center, 345 East 47th Street, New York, New York 10017.

8387

aircraft industry in the United States was quick to see the advantages of decimalization. By 1940 many aeronautical manufacturers were using the decimal inch exclusively for product dimensioning. In 1946, the SAE Aeronautical Drafting Manual was published, which included a description of a complete decimal inch dimensioning system.

During the period 1946 to 1961, many leading companies in the automotive, electrical, defense, and allied mechanical industries converted to the decimal inch using the two-place decimal as the basic increment. The majority of industrial firms are currently using the decimal dimensioning system, which makes it almost mandatory for the schools to familiarize prospective draftsmen and machine operators with this system. Industry has found it necessary to change to this system due to its compatability with computers and for programming for numerical control machine tools.

Utilization

The scales used and conversion practices followed will vary with some firms, from merely converting fractions to decimal equivalents to adoption of the "complete decimal inch system."

Drawing textbooks currently available still use fractional dimensions for most assignments. It is suggested that a system of converting fractions to decimal equivalents be used at the beginning levels, following conversion tables available in most texts. This will make it easier for the students to understand and accept decimals but, at the same time, they should be learning to think in terms of decimals--not to think common fractions and convert.

Advanced students familiar with the above practice could be introduced to the "complete decimal inch system," which would require the use of scales graduated in tenths and fiftieths--on which the smallest graduation is 0.02 inch. The complete decimal inch system uses increments of 0.02 inch or multiples thereof, such as 0.04, 0.24, 5.20, etc. Two-place decimal

8388

dimensions in other than 0.02 inch increments should be used where necessary to satisfy design requirements or where required to comply with standard commercial sizes of stock or tools.

For greater precision, three, four, or more decimal places may be used. Where less precision allows, one or no decimal place may be used. Decimal points should be bold, be given a full letter space, and placed in line with the bottom of the digits.

The number of places to which a decimal dimension is carried out will reflect the implied tolerance. An example is shown at the right.

UNLESS OTHERWISE SPECIFIED
1 - PLACE DEC ±.060 2 - PLACE DEC ±.030 3 - PLACE DEC ±.010 ANGULAR ± 2°

This implied tolerance may vary with different companies and should be specified in the title block area of the drawing.

The use of implied tolerances is a labor-saving device and not an inherent part of decimal dimensioning. Their use eliminates the need for specifying tolerance except where it differs from the implied.

A decimal dimension may be given as a UNILATERAL dimension: $1.878\ ^{+.000}_{-.003}$ which means that the permissible variation from the design size is shown in one direction. BILATERAL tolerancing permits variations in both directions, as $1.876\ ^{+.002}_{-.001}$

Another common practice is to apply the tolerance as a limit dimension. The relative position of the high and low limit is based upon the direction of material removal.

8389

The Metric System

Of the two major systems of weights and measures used in the world today, the United States uses the oldest one, which is based upon the inch and the pound. The other system, presently used by over 90 percent of the world's population, is the metric system, with the meter and kilogram as its base.

The metric system originated in France nearly 200 years ago, and the value of metric measurements as used by the French soon became so apparent to residents in adjoining countries that they gradually adopted metric weights and measures. A steady progression of metric usage in the majority of the world's countries followed, and now the internationally-understood language of measurements based on the metric system is called the International System of Units or SI.

Early in United States history, efforts were made to abandon the complicated inch-pound system in favor of the metric system. These efforts led to enactment of legislation by Congress in 1866 that made the metric system the only legal system of weights and measures in the United States. The law, however, did not state that use of metric measurements was compulsory.

Since that time, consistent but unsuccessful attempts have been made to pass a law making the metric system the only legal system in the United States. Starting in 1960, an almost annual attempt has been made to get Congress to approve a comprehensive study on advantages and disadvantages of the United States adopting the International System of Units.

The United States has drifted toward metrics and now uses a mixture of inch-pound/metric measurements, with the inch-pound system predominating. The SI has become the language of science in America. A number of groups (optical, pharmaceutical, chemical, etc.) have converted to the SI within their own industries.

1668 8390

Positional Dimensioning

True position dimensioning is the establishment of the theoretically exact location of a feature by means of basic dimensions. It provides for a tolerance zone uniformly distributed about this basic location and specifies the acceptable limits of deviation. True position tolerances are calculated to allow the maximum permissible deviation that will still guarantee assembly and interchangeability of parts. In many cases a bonus tolerance can be realized as a feature departs from its maximum material condition. The true position system may be used with coordinate or other methods in combinations that best suit the application. Examples of both the coordinate and true position systems of dimensioning are shown on pages 39 and 41.

Datums

Just as each of us depends on a road map when traveling in strange territory, a machinist depends on a drawing for specific directions when making a new part. Directions on a map or on a drawing have meaning only if the starting point is known and can be found with little difficulty. The machinist's starting point is called a datum. The following concepts are fundamental to specified or implied datum interpretation and use.

The term datum means something real or assumed which is used as a beginning for calculation or measurement. As "called out" or implied on drawings, datums are points, lines, planes, etc., assumed to be exact for purposes of computation and from which the location or geometric relationship (form) of other features of a part may be established. The word datum is used as an adjective with the applicable feature element.

As applied in manufacturing and inspection, datum references are established by relationship to the planes existing in the machine tool, jig, fixture, surface plate, gauge, or other setup or checking device. They may be either finished surfaces approximating true planes or planes developed by coordinate movements of the equipment.

8391

All manufactured parts contain datums, which may be specified on the drawing or implied by the dimensioning. Each feature requires a starting point from which its location and relationship to other features is established.

Unless otherwise specified, "maximum material condition" applies to datum references used to control true position tolerances. "Regardless of feature size" applies to datum references used to control positional and form tolerances. Datum surfaces and datum features that are single planes have no size and, therefore, result in an RFS application, regardless of intent.

An implied datum is one that is evident by the method of dimensioning. On most drawings, datums are not specified as such. However, dimensions referenced to a common surface or center line imply a datum. On the part shown below, the near or far side and the left and lower edges are implied datums by dimensional arrangement.

For production and inspection purposes either the near or far side could be used as the primary plane and the left and lower edges as secondary or third planes.

8392

Symmetrical parts sometimes require a point "P" to be marked on the part to identify the datums used in manufacture, thus avoiding conflict between manufacturing and inspection.

A specified datum is one that is identified by a symbol or note. The datum identity symbol consists of an identity letter preceded and followed by a dash within a rectangular frame. The symbol will be identified with the applicable line, plane, or point by one of the means shown below. Use of a datum surface is always preferable to a datum line.

Specified Datum Symbol

8393

Used as a reference, the specified datum identity letter is included in the feature control symbol without the dashes.

Where reference is made to two or more datums used to control positional or form tolerances of a feature, the primary datum letter is first; second datum letter is second, etc. Datum reference letters are placed in order of importance with respect to establishing location, form or position of other features, and will not necessarily be in alphabetical order, as applied.

Where a datum feature is controlled by a positional or form tolerance, the feature control symbol and the datum identification symbol are combined, as shown.

Three-Plane Concept

When a part is related to reference planes, it should be visualized in three dimensions. Datum features are specified or chosen in logical sequence to orient the part in relation to a set of three mutually perpendicular planes.

CYLINDRICAL DATUM FEATURES

Two datum planes are represented on the drawing by center lines intersecting, at right angles, the center of cylindrical datum features. Thus, one cylindrical datum feature is associated with two datum planes, and the intersection of these planes is called the datum axis. If the cylindrical feature is first in the specified datum sequence, these planes are the primary and secondary datum planes.

RECTANGULAR PARTS

The primary datum feature relates the part initially to the primary datum plane of the three-plane reference framework, as shown on the next page. Secondary and tertiary datum features relate the part to corresponding secondary and tertiary datum planes. For rectangular parts, the three planes are easily visualized, since flat surfaces of parts resemble datum planes.

8395

C	⊥A .005

OR:

C	⊥B .005

8396

Establishing Datum Planes

Since perfectly flat planes do not exist in either parts or machines, datum planes must be established by making contact with the relatively high-quality surfaces of machine tables, angle plates, etc., which can be considered to simulate perfect planes. Surfaces of the part, rough by comparison, actually touch at only a few points. To establish datum planes, minimum contact requirements are:

Primary Plane

- -- The three highest points by which the piece will rest without rocking
- -- If concave, the points along the edge upon which the part will rest in its free state (evenly shimmed where necessary)
- -- If convex, the center point plus equal spacing around the periphery
- -- If none of the previous conditions are satisfactory, the part shall be rough finished to establish a suitable datum with a minimum cut

Secondary Plane

- -- The two highest points which contact a plane at a right angle to the primary plane (It may also be established according to (b) or (c) above.)

Tertiary Plane

- -- The one highest point of contact with the tertiary datum plane at right angles to both primary and secondary planes

Since actual surfaces and features used to establish datums include all their irregularities, the same basic rules must be used in both manufacturing setup and in inspection setup. Parts that are flexible or have some degree of distortion in the free state must be fixed, during manufacture and inspection, in a position that will duplicate the assembled condition.

Establishing Datum Axes

In practice, the axis of a cylindrical datum feature is simulated by the axis of the processing equipment which centers the feature.

8397

Tolerance of Form

FUNCTION

Form tolerances state how far the actual part may deviate from the perfect shape implied by the drawing. They control the conditions of straightness, flatness, roundness, cylindricity, angularity, parallelism, perpendicularity, profile, and runout. Although primarily position controls, symmetry and concentricity tolerances are included. Normal shop practice limits and size tolerances provide adequate form control for average conditions. However, when more restrictive control is required, it should be specified. Symbols and modifiers are used to define these special conditions.

GEOMETRIC CHARACTERISTIC SYMBOLS			
	Characteristic		Symbol
Form Tolerances	For Single Feature	FLATNESS	▱
		STRAIGHTNESS	—
		ROUNDNESS (CIRCULARITY)	○
		CYLINDRICITY	⌭
		PROFILE (CONTOUR)	⌓
	For Related Features	PARALLELISM	∥
		PERPENDICULARITY (SQUARENESS)	⊥
		ANGULARITY	∠
		RUNOUT	↗
Positional Tolerances		TRUE POSITION	⊕
		CONCENTRICITY	◎
		SYMMETRY	⌯

FEATURE CONTROL SYMBOL

The basic control system consists of the characteristic symbol and the tolerance value within a rectangular frame. Datum references and modifiers are added when required. The following symbols are used extensively by industry and agree with U.S.A. standard Y14.5. Each has a definite meaning and can be quickly drawn. Use of these symbols on the drawing will save drafting time and make the drawing easier to read and more universally understood. Last, but far from least, they will eliminate the ambiguous and confusing drawing notes that have been used in the past.

8398

Flatness

When the flatness symbol is indicated, the surface can deviate within two parallel planes which are as far apart as the noted tolerance. The example shows a flatness tolerance of .002 over the surface. It should be understood that this symbol controls only flatness--not squareness or parallelism in any relation to any other surface.

Straightness

Straightness is the condition in which an element of a surface is a straight line, where the characteristics of flatness are common to a surface having one element in one plane. Straightness may be applied to cylindrical or conical surfaces.

8399

Roundness (Circularity)

Although related, separate symbols have been assigned to roundness and cylindricity. A roundness tolerance applied to a surface means that every point in any cross-section perpendicular to a reference access, or through the center of a ball, must lie between two concentric circles separated by a distance equal to the specified tolerance.

ROUND WITHIN .004

Cylindricity

A cylindricity tolerance applied to a surface means that the entire surface must lie between two coaxial cylinders separated by a distance equal to the tolerance specified. As in the case of roundness, cylindricity is measured with respect to itself, and a datum feature reference is not necessary.

CYLINDRICAL WITHIN .001

Profile (Contour)

Contour control is the means of controlling either a portion or the total outline of a part in which a uniform variation can be permitted from the basic untoleranced size dimensions.

TOLERANCE AT ALL POINTS WITHIN .010

Parallelism

Parallelism is the condition in which a plane is an equal distance from its datum throughout its entire length. The tolerance is the distance between two planes within which the surface must lie. These planes are parallel to the datum plane. In this example the surface is held parallel over its total area to datum A within .002.

PARALLEL TO A WITHIN .002 TOTAL

0049 8401

Perpendicularity (Squareness)

Perpendicularity is the condition of a feature which is at right angles to a datum or another feature.

Angularity

The angularity tolerance is the permissible variation from a specific angle. There are two basic ways that angularity control can be defined. One is in degrees, with an angular tolerance; the second is with a uniform tolerance zone between two parallel planes--within which the entire tolerance surface must lie. The planes are inclined from the datum at the exact nominal angle. In the illustration, the two sides of the tolerance zone are parallel. The acceptable tolerance is .003, the width of the tolerance zone.

Runout

Runout establishes control of features having a common axis, with measurements taken under a single setup. It is, therefore, necessary to establish a datum axis about which the features are to be related.

True Position

True position is the theoretically exact position for a feature.

DUP. 8403

Concentricity

It should be emphasized that concentricity is primarily a tolerance of position relating one axis to another. Therefore, it is preferable to use the concentricity symbol only when a definite control of axis is needed, regardless of feature size.

Symmetry

This is the condition in which the part or the feature has the same contour and size on each side of a central plane.

8404

The complete symbol should be read from left to right and top to bottom.

<u>Basic Symbol</u>

Means: This surface must be flat within .004 total.

▱	.004

<u>Modified Symbol</u>

Means: This feature must be perpendicular to datum A within .006 total at MMC.

⊥	A	.006 Ⓜ

<u>Modified Symbol</u>

Means: This feature must be perpendicular to datum A within .015 total RFS and must be flat within .004 RFS.

This feature then becomes datum C.

MAXIMUM MATERIAL CONDITION

THE TERM "MAXIMUM MATERIAL CONDITION" BASICALLY MEANS THAT A FEATURE OF A PART CONTAINS THE MAXIMUM AMOUNT OF MATERIAL PERMITTED BY ITS SIZE TOLERANCE. THAT IS, MAXIMUM MATERIAL CONDITION FOR INTERNAL FEATURES EXIST WHEN THESE FEATURES ARE AT THEIR MINIMUM ALLOWABLE SIZES AND FOR EXTERNAL FEATURES WHEN THEY ARE AT THEIR MAXIMUM ALLOWABLE SIZES. IT IS THE CONDITION RESULTING IN A MINIMUM CLEARANCE BETWEEN MATING PARTS. Ⓜ

(MMC) MAXIMUM MATERIAL CONDITION

INTERNAL FEATURE (HOLE)

EXTERNAL FEATURE

REGARDLESS OF FEATURE SIZE

REGARDLESS OF FEATURE SIZE "RFS" Ⓢ

THE APPLICATION OF (RFS) TO A POSITIONAL OR FORM TOLERANCE MEANS THAT THIS TOLERANCE MUST NOT BE EXCEEDED REGARDLESS OF THE ACTUAL SIZE TO WHICH THE FEATURE OR FEATURES ARE PRODUCED.

DRAWING MEDIA

Drawing paper and drafting techniques have changed and improved with the passage of time. Formerly, most engineering and technical drawings were rendered in pencil or ink on a relatively opaque sheet from which an ink tracing was made on a translucent sheet in order to obtain a reproduction.

Today, drawings are commonly rendered in pencil directly on a translucent sheet. Relatively opaque drawing papers are still produced and used; however, the term "tracing paper" has come to mean the translucent drawing paper on which most drawings are rendered, even though the "tracing" operation generally is outmoded.

Tracing Papers

The selection of satisfactory tracing paper is the first requirement for successful reproduction.

There are two primary types of tracing paper. "Natural paper" has natural translucency as it comes from the mill. "Prepared" papers, frequently called vellum, are of a similar basic paper stock, but have been treated to secure additional transparency so that prints may be made at a faster speed than with natural paper.

Translucency

Translucency--the characteristic of permitting the passage of light and, in printmaking, particularly the ultraviolet rays--is very desirable in paper used for making drawings, as it contributes substantially to good reproduction. Quite often one paper may appear more translucent than another, yet it may actually permit less ultraviolet transmission due to a yellowish tint to the paper which impedes the passage of the actinic rays of the printing machine. Therefore, a good tracing paper should be white or only slightly bluish in tint, since the blue tint is only a slight obstacle to the passage of ultraviolet light.

8411

8410

Thinness also contributes to the translucency of paper, but because of other considerations--mainly that of strength--tracing papers are rarely made in basis weights lighter than 12 pounds. ("Basis weight" is defined as the weight of 500 sheets of 17" x 22" paper.)

Another important consideration in selecting tracing paper is uniformity of thickness, since variations in thickness will result in variations in translucency and unsatisfactory prints.

Surface Quality and Tooth

The softer grades of drawing pencils deposit more graphite on paper and hence produce more opaque lines. However, many draftsmen continue to use the harder grades because they produce sharper lines and do not smudge as readily under drafting instruments and perspiring arms and hands. If harder pencil grades are to be used, the drawing paper must have sufficient surface roughness, called "tooth," to wear away sufficient graphite to give a uniform line of consistent opacity. A smooth surface paper takes a more uniform deposit of graphite than one with "tooth." However, the graphite on the smooth paper will smear more easily than the line on the paper with "tooth." The harder leads should not be used, for they tend to engrave and emboss the paper, making successful erasures difficult.

A graphite or pencil line, under magnification, is not a continuous line but a chain of graphite particles with spaces or voids between them. The fewer open spaces in the graphite line the better, as light passing through the voids weakens the image on the reproduction.

Surface finish of the paper also is important when ink is used, for it must not absorb the ink excessively and neither repel nor "feather" it. The surface must take the ink exactly as the ruling or lettering pen delivers it. The ink must adhere to the paper surface so that it will not flake off after drying, but it must not penetrate so deeply that it cannot be erased with reasonable ease. Also, paper must not pucker due to the wetting action of

8413
8412

the ink. Puckering, also called "cockling," "cockle," or waviness, may also be produced by perspiration from hands or arms and may interfere with the contact between the original and the reproduction paper during printing exposure, resulting in "fuzzy" prints.

Erasability

It is inevitable that engineering drawings will be changed or revised. This imposes a requirement that tracing paper withstand repeated erasures. Erasures should be made with extreme care, and the draftsman should be encouraged to use the type of eraser recommended for the drawing medium on which he is working.

A good tracing paper must be capable of withstanding not just one but several erasures in the same spot and should leave no "ghost" to show on the reproduction. Even after repeated erasures, the paper should permit the draftsman to draw clearly and sharply over the erased area without feathering the line.

Although pencil drawings are now predominant, occasionally an ink drawing must be made, or the draftsman may wish to use ink on some portion of his pencil drawing. Good erasing quality in the paper is a critical requirement in pencil drawings but is obviously much more important when ink is used.

Paper Strength - Aging Qualities

After the drawing has been completed and checked for accuracy, it goes to the graphic reproduction center to obtain the required number of prints.

Some mutilation, smudging, wrinkling, or other quality deterioration invariably results when the operator picks up the drawing as it emerges from the printer, and then feeds it back on the sensitized paper. The principal danger in such handling is the risk of tearing a drawing which represents a sizable expenditure of engineering and drafting time. Consequently, another important characteristic of tracing paper is high resistance to tearing.

8413

In the printing or reproduction machines, the drawing is subjected to intense ultraviolet light and high temperatures. Therefore, it must also resist curling, shrinking, stretching, and embrittlement. A good paper must resist "yellowing" with age, as this characteristic effectively filters the printing light, thus requiring greater printing time.

Paper must also have uniform "formation" or texture, otherwise fiber-clusters, foreign matter, or other blemishes such as watermarks, dirt, specks, or oil spots are likely to be reproduced in the prints.

The required characteristics of tracing paper are usually best met by carefully made 100% rag paper--preferably made from strong, uniform, new cotton rags, such as white shirt cuttings. There are no qualities in rag paper which may not eventually be achieved by wood fiber papers but, at the present, rag papers are superior.

Pencil Tracing Cloth

Pencil tracing cloth is used where greater durability and permanence are desired than can be obtained with paper. Such cloths are more expensive than paper and most of them permit the use of both pencil and ink.

One type of pencil tracing cloth is processed to make it quite impervious to moisture--whether from accidental wetting or the perspiration of the draftsman.

Other Drawing Media

Polyester film, acetate film, glass cloth, and other materials are being used in increasing amounts as drawing media. A distinctive characteristic of these materials is improved dimensional stability.

Polyester film appeared on the market early in 1958. Its popularity as a drafting room drawing media soared. Today it is perhaps the leading media, crowding out the old standbys such as vellum and cloth.

8414

122 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

The reasons for its popularity are many, such as:

-- Toughness. This media offers almost complete immunity to tearing.

-- Stability. It is relatively unaffected by temperature and humidity; as a result it will not buckle or curl and always lies flat on the drawing board.

-- Permanence. Even after long periods in storage, drafting films will not become brittle and will not fade, age, yellow, crack, rip, peel, or wrinkle.

-- Erasability. Using a soft pencil eraser, preferably of the plastic type, lines can be removed easily without leaving "ghosts."

-- Printability. Due to its high degree of transparency it gives faster reproductions--a very important consideration in reducing print-back costs. Since stored drawings produced on mylar do not pick up opaquing properties, such as commonly happens with vellum and cloth, reproduction printing speeds are not slowed up and the user is assured of obtaining good first, second, or third generation sepia intermediates.

However, the same considerations in the care and preparation of drawings rendered on tracing paper and cloth generally apply in the use of these new materials.

Grades of Pencils

The quality and grade of the pencil used is important in the preparation and reproduction of technical drawings. Since wood drawing pencils and mechanical pencil leads are available in many degrees of hardness, the grade selected should be compatible with the type of drawing medium to be used. Careful selection, after adequate tests, will be well worthwhile. Avoid the use of regular writing pencils, since they tend to produce gray lines which do not print well.

The selection of the grade of pencil or lead, under a given set of conditions, is determined by a number of factors, such as:

-- Quality and texture of the drawing medium
-- Atmospheric conditions such as humidity and their effects on the drawing medium
-- Type of work being done
-- Method of reproduction
-- Draftsman's personal preference

8415

121

Before a particular brand of drawing pencil or lead is selected, it is suggested that it be tested for the following characteristics:

-- Uniformity of grading and labeling
-- Smoothness
-- Point strength
-- Wear
-- Wood clinching
-- Straightness
-- Smudging
-- Lead centering
-- Erasability

Graphite pencils are not recommended for use with mylar drafting film, as a certain amount of graphite flaking will occur which tends to smudge the drawing. Special plastic lead pencils have been developed especially for this drafting media.

As important as media and leads are to the production of quality documents, correct drafting techniques are equally essential in the making of good prints. Thin or light pencil lines "burn out" during the reproduction process and require retouching before acceptable reproductions can be obtained.

MICROFILMING

Microfilming is a photographic process by which documents such as engineering drawings are reduced to a small fraction of their original size.

In its early days, microfilming was valued as insurance against disaster or for its space-saving features. It became apparent that existing methods of handling active engineering information were not adequate to satisfy the demands imposed by industry which was becoming more and more automated. A new application for microfilming emerged. Combining the potentials of microfilm and the EAM (Electric Accounting Machine) card, by mounting a micro-image of an engineering drawing in an apertured EAM card, resulted in a new approach to the handling of engineering information.

The use of unitized microfilm provides a radically new medium with potential far beyond that of a single print. It is not just a new technique for making prints. It is a new working tool around which a fully integrated system can be built.

Some of the more important features of microfilming as related to the function of providing an improved and more economical means of handling engineering information are:

-- It is a compact medium for information storage. Its ability to concentrate large amounts of information in a small package provides for a more efficient system.

-- Drawings are reduced to a uniform size and mounted in EAM cards which, in turn, permits the introduction of automated functions.

-- The original microfilm may be duplicated, and all copies of the film may be used to produce enlarged prints, or the film can be viewed in a reader without printing.

-- It simplifies the maintenance of a complete and up-to-date drawing file.

-- Files become more efficient, more compact, and more easily controlled. Satellite and archival files become feasible and financially practical.

-- Costs--such as reproduction, handling, and mailing--are reduced.

8418

There are many variations in microfilm systems, depending on the characteristics of equipment produced by each manufacturer. However, regardless of the specifics of a system, the above benefits result from conversion to a microfilm system.

The following equipment is required to produce microfilm:

-- Camera - for exposing the microfilm

-- Processor - for developing the microfilm

-- Inspection equipment - for checking film quality

-- Electric accounting machines - for entering the visible identification information on aperture cards

-- Mounter - for cutting frames of microfilm and mounting each into an aperture card

-- Microfilm printers - for making film copies required for distribution

In the process of making microfilm, documents are prepared for photographing and taken to the camera. A microphotograph is made with a precision camera using high-resolution film, which is developed in a processor capable of controlling development within very close limits. The processed film is inspected to assure that the camera and processor have produced the desired quality of microfilm.

After inspection, the film is ready for mounting in aperture EAM cards. These must have identification information printed on them by EAM equipment, as the micro-image on the film is too small to be read without magnification.

The mounting operation permanently seats the micro-image of the drawing accurately in the center of the aperture.

The microfilm is now ready for use. It may go directly into the engineering file or it may be used as a master to make additional copies for distribution.

8419

The following equipment is required to use microfilm:

-- File equipment

-- Manual or automated card-to-card printers

-- Readers

-- Enlarger-printers (reader-printers)

A card-to-card printer is a device capable of making an exact copy of a microfilm in a few seconds. Blank sensitized film mounted in a "copy card" is used to make the copy. It may be exposed and developed in a normally lighted room.

A reader is a projection device which enlarges a micro-image sufficiently for normal reading. A large reader is used when it is essential that the whole image be viewed at the same time. The small reader provided with a scanning device is finding wide use as a desk-top reader.

Enlarger-printers make enlarged prints (hard copy) and reproducibles from microfilm. Some models have facilities for both viewing the image and making enlargements. These are called reader-printers.

It should be emphasized that microfilm is not a panacea for all reproduction problems. There are situations where it fits, and there are others where it does not fit.

Let us take as an example a design engineer who uses a few drawings at a time. He may spend a great deal of time studying them while he is considering a design change. It may be necessary for two or three people to gather around these drawings to study and discuss them. Obviously, it would be difficult to work entirely from a reader. A situation like this suggests the need for prints.

This situation may be contrasted with that of engineers who are engineering new jobs from existing drawings. They may require many drawings, each providing information which must be taken off and entered as part of the data necessary to engineer the new job. Often, a drawing is referred to only

8421

8420

to obtain a single number, while at other times substantial information must be taken from the drawing. For this type of usage, a reader would serve very well, although this same engineer--as the job progresses--may find it necessary to have prints or reproducibles to mark and transmit to others.

It is apparent that, if a system is built totally around readers without regard for the need for prints, it would not be a well-engineered application. At the same time, if the system is built totally around printmaking, the advantages and economies of using readers would not have been given proper consideration.

Engineering personnel who travel or who work at some point remote from central engineering information sources are always at a disadvantage when prints are needed. Because the compactness of microfilm permits large numbers of drawings to be carried conveniently and economically, the problem is rather simply resolved.

By virtue of the characteristics of microfilm, engineering personnel have easy access to all of the information needed. This assures them of the most important element in getting their job done; that is, to be able to get information immediately and to see the job to a conclusion with fewer starts, stops, and delays which result from lack of complete information.

While there are some conditions where quality seems to improve in the microfilming process, the general rule is that there is always some loss, however small, in making any kind of copy by any reproduction process. This, then, gives emphasis to the fact that best results will be obtained with strict observance to certain rules and guides in the preparation, changing, handling, and storing of drawings.

Since the quality of the original document is so important to an effective microfilm system, it is necessary to consider the role which the draftsman plays in the development of an effective system.

8421

It is imperative to remember that a drawing is a tool. Its function is to convey information to the production and assembly floor employees for the manufacture of an item of functional hardware. These people get all of their information for processing and fabricating from a copy of the original drawing. Each component and the finished product is inspected with the aid of a drawing copy. The product is shipped to the consumer who installs, inspects, integrates into a system, and maintains it through the use of a drawing copy. These copies may, of course, take many forms, but the emphasis here is on microfilm.

One common drawing size, 34" x 44", will be reduced to a piece of film 1-1/4" x 1-3/4", with a maximum image area of 1.197 x 1.615. This is a reduction of 30 times. A 3/8" high letter reduced 30 times will become 1/80 of an inch; smaller than a period. A closed 5 or 3, or any letter not properly made, will become illegible in the reproduction process. If the man in the shop or in the field attempts to interpret these figures and guesses wrong, untold loss in terms of scrap and time will result, and schedules will not be met. Hardware can be fabricated economically and accurately only with clear, concise drawing copies. These can be made only from clear, concise, well-drawn and well-organized originals. It is often necessary to make new originals from copies and the resulting "original" may be, in part, a third or fourth generation from the initial original.

Typical house standards as they affect a draftsman's work might be these:

-- The minimum size numeral to be used for the drawing number should not be less than .40 of an inch in height.

-- Dependent on the size of the drawing paper, the following are minimum heights of letters and figures to be used for titles, dimensions, and notes:

8.5 x 11 -- .10 minimum	22 x 34 -- .12 minimum
11 x 17 -- .10 minimum	34 x 44 -- .20 minimum
17 x 22 -- .10 minimum	34 x 60 -- .30 minimum

8422

-- Lines of lettering should be spaced approximately .12 inches apart.

-- A minimum space of .04 should be maintained between letters, symbols, numerals, dashes, and decimal points.

-- Dashes used in notes should be approximately .10 inches long and cleanly broken.

-- Letters and numerals such as A-N-M-Y-V-W-4 must have a clean, sharp, and full opening at each vertex.

-- Numerals 3-5-6-8-9 must have full round loops.

-- Decimal points must be uniform, dense, and large to be clearly visible on reduced-size prints. Decimal points should be placed in line with the bottom of the associated digits and be given adequate space.

Specific examples of poor drafting techniques which result in poor prints by a reproduction operation include: poor erasures, crowded dimensions, use of hard pencils, improper letter size, crowded lines, lack of uniformity in line density, failure to restore accidental erasures, poor planning, paper clips and cleaning materials left rolled in the drawing, and poorly affixed stick-on's.

The foundation for quality reproductions is built by the draftsman. He must be aware of what happens to his drawing once it is completed. A good legible copy cannot be made without a good original. Unless the draftsman concerns himself and avails himself of all of the aids at his disposal, his effort is for naught.

It should be kept in mind, also, that most engineering-drawing microfilm systems provide enlarged blowbacks which are smaller than the original. This places even greater emphasis on the establishment of adequate drafting standards. It leaves little doubt as to the important part the draftsman plays in a successful microfilm program.

The advantages of microfilm systems have, here, been oriented to engineering personnel. These advantages hold true for all users of microfilm, including tool engineers, production, purchasing, sales, and quality control personnel.

8423

To gain these advantages one must be able to obtain a quality microfilm. The military, as well as industry, has written standards and specifications related to inspection of microfilm. One of the military specifications requires the capacity for a completely legible copy from a fourth generation microfilm. This means that five copies must be made, one from the other, and reemphasizes the quality which the initial document must possess. Also, as previously stated, blowbacks (reproductions) from microfilm are not to the full, original size. This reaffirms the need for lettering and dimensions to be larger, so as to compensate for this reduction and for sharp, clear letters and figures. Line weight (width) and density are very important so as to provide good contrast.

To sum up the draftsman's role as it relates to microfilm is very simple. Quality microfilm starts with a quality document. This is the drawing. Quality, or a better term--workmanship--must, in the eyes of the draftsman, be considered as important as the technical content of the drawing. What good is a drawing that is 100% technically correct but cannot be used to make copies in reproduction systems such as microfilm because of poor workmanship?

"Creative Teaching with Microfilm," a reprint from the Journal of the National Microfilm Association for Drafting Instructors in Vocational Education and Industrial Arts

8426

APPENDIX

The preceding materials have been prepared as a means of assisting instructors of drafting in their efforts to present instruction which closely parallels current industrial practice. Since some may experience difficulty in securing prints from industries, the following are included as prints typical of industry and have been solicited from several sources.

ABSTRACT - Developed for the Bureau of Naval Personnel, this training manual is to be used by Naval and Naval Reserve Personnel who are studying for advancement to the rates of Commissaryman 3 and 2. Chapters are (1) Advancement to Petty Officer, (2) The Food Service Division, (3) Inspecting Subsistence Items, (4) Storage and Care of Subsistance Items, (5) Galley and Meat Cutting Equipment, (6) Nutrition and Menu Planning, (7) Expenditure of Subsistence Items, (8) Sanitation in the General Mess, (9) Meat, (10) Food Preparation, (11) Baking, (12) Food Service, and (13) Landing Party. Illustrations, photographs, and charts augment the text. A list of training films is appended, and a subject index is included. (Author/SB)

BUREAU OF NAVAL PERSONNEL

NAVY TRAINING COURSE NAVPERS 10279-D

PREFACE

This book was prepared by the Training Publications Division, Naval Personnel Program Support Activity, Washington, D.C., for the Bureau of Naval Personnel. Technical assistance was provided by the Bureau of Supplies and Accounts, Washington, D.C.; by the U.S. Navy Subsistence Office, Washington, D.C.,; and the U.S. Naval Schools Command, U.S. Naval Station, Newport, Rhode Island.

THE UNITED STATES NAVY

GUARDIAN OF OUR COUNTRY

The United States Navy is responsible for maintaining control of the sea and is a ready force on watch at home and overseas, capable of strong action to preserve the peace or of instant offensive action to win in war.

It is upon the maintenance of this control that our country's glorious future depends; the United States Navy exists to make it so.

WE SERVE WITH HONOR

Tradition, valor, and victory are the Navy's heritage from the past. To these may be added dedication, discipline, and vigilance as the watchwords of the present and the future.

At home or on distant stations we serve with pride, confident in the respect of our country, our shipmates, and our families.

Our responsibilities sober us; our adversities strengthen us.

Service to God and Country is our special privilege. We serve with honor.

THE FUTURE OF THE NAVY

The Navy will always employ new weapons, new techniques, and greater power to protect and defend the United States on the sea, under the sea, and in the air.

Now and in the future, control of the sea gives the United States her greatest advantage for the maintenance of peace and for victory in war.

Mobility, surprise, dispersal, and offensive power are the keynotes of the new Navy. The roots of the Navy lie in a strong belief in the future, in continued dedication to our tasks, and in reflection on our heritage from the past.

Never have our opportunities and our responsibilities been greater.

MB 507	Hygiene

Correspondence

CB 150	Review Arithmetic
CB 507	Hygiene

*"Members of the United States Armed Forces Reserve components when on active duty are eligible to enroll for USAFI courses, services, and materials if the orders calling them to active duty for a period of 120 days or more regardless of the time specified in the active duty orders."

CHAPTER 1

ADVANCEMENT TO PETTY OFFICER

This training course has been prepared for men of the Navy and of the Naval Reserve who are studying for advancement to the rates of Commissaryman 3 and Commissaryman 2.

The Commissaryman qualifications which were used as a guide in the preparation of this training course are those contained in the Manual of Qualifications for Advancement in Rating, NavPers 18068-B. Changes occurring after revision 18068-B are not reflected in this text.

Chapters 2 through 13 of this training course deal with the professional (technical) matter of the Commissaryman rating. Chapter 2 provides detailed information about the organization of the general mess within the Supply Department, and the duties of the men who work in the Food Service Division.

Succeeding chapters discuss inspection of foods, their storage and care, the equipment used in food preparation, nutrition and menu planning, expenditure of subsistence items, sanitation in the general mess, food conservation, meats, general instructions for food preparation, baking, food service, and food preparation under emergency conditions.

The remainder of this chapter gives information on the enlisted rating structure, the Commissaryman rating, requirements and procedures for advancement in rating, and references that will help you both in working for advancement and in performing your duties as a Commissaryman. This chapter includes information on how to make the best use of Navy Training Courses. Therefore, it is strongly recommended that you study this chapter carefully before beginning intensive study of the remainder of this training course.

THE ENLISTED RATING STRUCTURE

The two main types of ratings in the present enlisted rating structure are general ratings and service ratings.

GENERAL RATINGS identify broad occupational fields of related duties and functions. Some general ratings include service ratings; others do not. Both Regular Navy and Naval Reserve personnel may hold general ratings.

SERVICE RATINGS identify subdivisions or specialties within a general rating. Although service ratings can exist at any petty officer level, they are most common at the PO3 and PO2 levels. Both Regular Navy and Naval Reserve personnel may hold service ratings.

THE COMMISSARYMAN RATING

The Commissaryman rating is a general rating; there are no service ratings. Commissarymen operate the general mess for enlisted men in the Navy. They serve as cooks and bakers on ships and shore stations. In this capacity Commissarymen prepare food, assist in ordering subsistence items, check deliveries for quantity, and inspect for quality, stow subsistence items, and maintain cleanliness and sanitation of the galley and related spaces.

To learn about the Commissaryman rating, study the qualifications for advancement in rating.

To qualify for Commissaryman 3 you must have acquired a broad knowledge of the Food Service Division's activities as a whole and a detailed knowledge of those activities of the Division that you will be required to perform.

You will be expected to know how the general mess is organized, who is in charge, and the daily routine that is followed.

You must be able to take your place in a galley watch, which includes knowing how to operate, secure, and clean the galley equipment such as food mixers, meat grinders, ovens, and ranges.

You should know what to do to keep foods wholesome from the time of their arrival aboard ship until they are prepared and served. This includes knowing how to care for refrigerators,

vegetable lockers, and other storage facilities. It also includes a knowledge of the basic causes of food poisoning and the special care required to prevent food spoilage.

You also must know how to determine the quantities of subsistence necessary to prepare the number of servings required in your mess and the regulations for drawing them from the storerooms.

You should be able to cook and bake as required in the Qualifications for Advancement in Rating. You must be familiar with and know how to use the recipes and guides to food preparation provided in the Navy-Marine Corps Recipe Service, NavSandA Publication 7/MCO-P10110.16; Navy Food Service; and Food Operations Reference Manual, NavSandA Publication 421.

To advance to Commissaryman 2, you must know more about the operation of the Food Service Division, and be able to perform more complicated duties than you did when you passed your third class examinations.

By this time, you will have to know the functions of vitamins and minerals in the diet and their sources in various foods. You will have to know the names and the proper uses of the various standard cuts of beef, veal, lamb, and pork, and the location of each cut on the meat carcass. Also, a knowledge of the proper ways to carve meat and poultry for serving will be required.

Morale is a word having a great deal of significance in the Navy. You as a Commissaryman, can contribute much toward the morale of your ship by serving high quality food in the general mess.

As you prepare for advancement to CS3 and then to CS2, you will hear a good deal about your increasing responsibilities in connection with General Order No. 21 and the naval leadership program. In addition to the general leadership required of all petty officers, there are applications of leadership to the duties of your rating.

Basically, your responsibilities for technical leadership arise from the very nature of your work. Keeping the ship's galley operating and the cooking and serving of the foods as desired by all hands is a tremendous task.

Technical leadership is more than just giving orders. In fact, you can demonstrate some of the most important aspects of technical leadership even if you are not required to tell anyone else what to do about anything. As a CS3 or CS2, you demonstrate technical leadership when you follow orders exactly, when you observe safety precautions, when you accept responsibility, when you continue to increase your knowledge of the Commissaryman's job, and when you perform every detail of your work with complete integrity and reliability.

Integrity of work is really a key factor in technical leadership, and all other factors relate to it in some way. Integrity of work refers to big things and to little things—the way you stand a galley watch, your concern for cleanliness, the way you cut meat, the way you supervise the mess line, the way you receive and issue subsistence items, and the way you bake bread. When you perform every job as efficiently as you can, and when you are constantly working to increase your skill and broaden your knowledge, you are demonstrating integrity of work in a concrete, practical, everyday sort of way. When your work has integrity, you are demonstrating technical leadership.

ADVANCEMENT IN RATING

Some of the rewards of advancement in rating are easy to see. You get more pay. Your job assignments become more interesting and more challenging. You are regarded with greater respect by officers and enlisted personnel. You enjoy the satisfaction of getting ahead in your chosen Navy career.

But the advantages of advancing in rating are not yours alone. The Navy also profits. Highly trained personnel are essential to the functioning of the Navy. By each advancement in rating, you increase your value to the Navy in two ways. First, you become more valuable as a technical specialist in your own rating. And second, you become more valuable as a person who can train others and thus make far-reaching contributions to the entire Navy.

How to Qualify for Advancement

What must you do to qualify for advancement in rating? The requirements may change from time to time, but usually you must:

1. Have a certain amount of time in your present grade.
2. Complete the required military and professional training courses.
3. Demonstrate your ability to perform all the PRACTICAL requirements for advancement by completing the Record of Practical Factors, NavPers 760.
4. Be recommended by your commanding officer, after the petty officers and officers

8458

REQUIREMENTS *	E1 to E2	E2 to E3	E3 to E4	E4 to E5	E5 to E6	†E6 to E7	† E7 to E8	† E8 to E9
SERVICE	4 mos. service—or completion of recruit training.	6 mos. as E-2.	6 mos. as E-3.	12 mos. as E-4.	24 mos. as E-5.	36 mos. as E-6.	36 mos. as E-7. 8 of 11 years total service must be enlisted. Must be permanent appointment.	24 mos. as E-8. 10 of 13 years total service must be enlisted.
SCHOOL	Recruit Training.		Class A for PR3, DT3, PT3, AME 3, HM 3			Class B for AGCA, MUCA, MNCA.		
PRACTICAL FACTORS	Locally prepared check-offs.	Records of Practical Factors, NavPers 760, must be completed for E-3 and all PO advancements.						
PERFORMANCE TEST			Specified ratings must complete applicable performance tests before taking examinations.					
ENLISTED PERFORMANCE EVALUATION	As used by CO when approving advancement.	Counts toward performance factor credit in advancement multiple.						
EXAMINATIONS	Locally prepared tests.		Navy-wide examinations required for all PO advancements.				Navy-wide, selection board, and physical.	
NAVY TRAINING COURSE (INCLUDING MILITARY REQUIREMENTS)		Required for E-3 and all PO advancements unless waived because of school completion, but need not be repeated if identical course has already been completed. See NavPers 10052 (current edition).					Correspondence courses and recommended reading. See NavPers 10052 (current edition).	
AUTHORIZATION	Commanding Officer		U.S. Naval Examining Center			Bureau of Naval Personnel		
	TARS attached to the air program are advanced to fill vacancies and must be approved by CNARESTRA.							

* All advancements require commanding officer's recommendation.
† 2 years obligated service required.

Figure 1-1.—Active duty advancement requirements.

0028 8459

supervising your work have indicated that they consider you capable of performing the duties of the next higher rate.

5. Demonstrate your KNOWLEDGE by passing a written examination on (a) military requirements and (b) professional qualifications.

Some of these general requirements may be modified in certain ways. Figure 1-1 gives a more detailed view of the requirements for advancement of active duty personnel; figure 1-2 gives this information for inactive duty personnel.

Remember that the requirements for advancement can change. Check with your division officer or training officer to be sure that you know the most recent requirements.

Advancement in rating is not automatic. After you have met all the requirements, you are ELIGIBLE for advancement. You will actually be advanced in rating only if you meet all the requirements (including making a high enough score on the written examination) and if the quotas for your rating permit your advancement.

How to Prepare for Advancement

What must you do to prepare for advancement in rating? You must study the qualifications for advancement, work on the practical factors, study the required Navy Training Courses, and study other material that is required for advancement in your rating. To prepare for advancement, you will need to be familiar with (1) the Quals Manual, (2) the Record of Practical Factors, NavPers 760, (3) a NavPers publication called Training Publications for Advancement in Rating, NavPers 10052, and (4) applicable Navy Training Courses. Figure 1-3 illustrates these materials; the following sections describe them and give you some practical suggestions on how to use them in preparing for advancement.

The Quals Manual

The Manual of Qualifications for Advancement in Rating, NavPers 18068-B, gives the minimum requirements for advancement to each rate within each rating. This manual is usually called the "Quals Manual," and the qualifications themselves are often called "quals." The qualifications are of two general types: (1) military requirements, and (2) professional or technical qualifications.

MILITARY REQUIREMENTS apply to all ratings rather than to any one particular rating. Military requirements for advancement to third class and second class petty officer rates deal with military conduct, naval organization, military justice, security, watch standing, and other subjects which are required of petty officers in all ratings.

PROFESSIONAL QUALIFICATIONS are technical or professional requirements that are directly related to the work of each rating.

Both the military requirements and the professional qualifications are divided into subject matter groups; then, within each subject matter group, they are divided into PRACTICAL FACTORS and KNOWLEDGE FACTORS. Practical factors are things you must be able to DO. Knowledge factors are things you must KNOW in order to perform the duties of your rating.

The written examination for advancement in rating will contain questions relating to the practical factors and the knowledge factors of both the military requirements and the professional qualifications. If you are working for advancement to second class, remember that you may be examined on third class qualifications as well as second class qualifications.

The Quals Manual is kept current by means of changes. The professional qualifications in your rating which are covered in this training course were current at the time the course was printed. By the time you are studying this course, however, the quals for your rating may have been changed. Never trust any set of quals until you have checked the change number against an UP-TO-DATE copy of the Quals Manual.

Record of Practical Factors

Before you can take the servicewide examination for advancement in rating, there must be an entry in your service record to show that you have qualified in the practical factors of both the military requirements and the professional qualifications. A special form known as the RECORD OF PRACTICAL FACTORS, NavPers 760, is used to keep a record of your practical factor qualifications. This form is available for each rating. The form lists all practical factors, both military and professional. As you demonstrate your ability to perform each practical factor, appropriate entries are made in the DATE and INITIALS columns.

Changes are made periodically to the Manual of Qualifications for Advancement in Rating, and revised forms of NavPers 760 are provided when necessary. Extra space is allowed on the

REQUIREMENTS *		E1 to E2	E2 to E3	E3 to E4	E4 to E5	E5 to E6	E6 to E7	E8	E9
	FOR THESE DRILLS PER YEAR								
TOTAL TIME IN GRADE	48	6 mos.	6 mos.	15 mos.	18 mos.	24 mos.	36 mos.	36 mos.	24 mos.
	24	9 mos.	9 mos.	15 mos.	18 mos.	24 mos.	36 mos.	36 mos.	24 mos.
	NON-DRILLING	12 mos.	24 mos.	24 mos.	36 mos.	48 mos.	48 mos.		
TOTAL TRAINING DUTY IN GRADE †	48	14 days	14 days	14 days	14 days	28 days	42 days	42 days	28 days
	24	14 days	14 days	14 days	14 days	28 days	42 days	42 days	28 days
	NON-DRILLING	None	None	14 days	14 days	28 days	28 days		
PERFORMANCE TESTS				Specified ratings must complete applicable performance tests before taking examination.					
DRILL PARTICIPATION		Satisfactory participation as a member of a drill unit.							
PRACTICAL FACTORS (INCLUDING MILITARY REQUIREMENTS)		Record of Practical Factors, NavPers 760, must be completea for all advancements.							
NAVY TRAINING COURSE (INCLUDING MILITARY REQUIREMENTS)		Completion of applicable course or courses must be entered in service record.							
EXAMINATION		Standard exams are used where available, otherwise locally prepared exams are used.						Standard EXAM, Selection Board, and Physical.	
AUTHORIZATION		District commandant or CNARESTRA					Bureau of Naval Personnel		

* Recommendation by commanding officer required for all advancements.

† Active duty periods may be substituted for training duty.

Figure 1-2.—Inactive duty advancement requirements.

8461

Figure 1-3.—Materials used in preparing for advancement.

Record of Practical Factors for entering additional factors as they are published in changes to the Quals Manual. The Record of Practical Factors also provides space for recording demonstrated proficiency in skills which are within the general scope of the rating but which are not identified as minimum qualifications for advancement.

If you are transferred before you qualify in all practical factors, the NavPers 760 form should be forwarded with your service record to your next duty station. You can save yourself a lot of trouble by making sure that this form is actually inserted in your service record before you are transferred. If the form is not in your service record, you may be required to start all over again and requalify in the practical factors which have already been checked off.

NavPers 10052

Training Publications for Advancement in Rating, NavPers 10052 (revised), is a very important publication for anyone preparing for advancement in rating. This bibliography lists required and recommended Navy Training Courses and other reference material to be used by personnel working for advancement in rating. NavPers 10052 is revised and issued once each year by the Bureau of Naval Personnel. Each revised edition is identified by a letter following the NavPers number. When using this publication, be SURE that you have the most recent edition.

If extensive changes in qualifications occur in any rating between the annual revisions of NavPers 10052, a supplementary list of study material may be issued in the form of a BuPers Notice. When you are preparing for advancement, check to see whether changes have been made in the qualifications for your rating. If changes have been made, see if a BuPers Notice has been issued to supplement NavPers 10052 for your rating.

The required and recommended references are listed by rate level in NavPers 10052. If you are working for advancement to third class, study the material that is listed for third class. If you are working for advancement to second class, study the material that is listed for second class; but remember that you are also responsible for the references listed at the third class level.

In using NavPers 10052, you will notice that some Navy Training Courses are marked with an asterisk (*). Any course marked in this way is MANDATORY—that is, it must be completed at the indicated rate level before you can be eligible to take the servicewide examination for advancement in rating. Each mandatory course may be completed by (1) passing the appropriate enlisted correspondence course that is based on the mandatory training course; (2) passing locally prepared tests based on the information given in the training course; or (3) in some cases, successfully completing an appropriate Class A school.

Do not overlook the section of NavPers 10052 which lists the required and recommended references relating to the military requirements for advancement. Personnel of ALL ratings must complete the mandatory military requirements training course for the appropriate rate level before they can be eligible to advance in rating.

The references in NavPers 10052 which are recommended but not mandatory should also be studied carefully. ALL references listed in NavPers 10052 may be used as source material for the written examinations, at the appropriate rate levels.

Navy Training Courses

There are two general types of Navy Training Courses. RATING COURSES (such as this one) are prepared for most enlisted ratings. A rating training course gives information that is directly related to the professional qualifications of ONE rating. SUBJECT MATTER COURSES or BASIC COURSES give information that applies to more than one rating.

Navy Training Courses are revised from time to time to keep up to date technically. The revision of a Navy Training Course is identified by a letter following the NavPers number. You can tell whether any particular copy of a Navy Training Course is the latest edition by checking the NavPers number and the letter following this number in the most recent edition of List of Training Manuals and Correspondence Courses, NavPers 10061. (NavPers 10061 is actually a catalog that lists all current training courses and correspondence courses; you will find this catalog useful in planning your study program.)

Navy Training Courses are designed to help you prepare for advancement in rating. The following suggestions may help you to make the

8463

best use of this course and other Navy training publications when you are preparing for advancement in rating.

1. Study the military requirements and the professional qualifications for your rating before you study the training course. Remember, you are studying the training course primarily in order to meet these quals.

2. Set up a regular study plan. It will probably be easier for you to stick to a schedule if you can plan to study at the same time each day. If possible, schedule your studying for a time of day when you will not have too may interruptions or distractions.

3. Before you begin to study any part of the training course intensively, become familiar with the entire book. Read the preface and the table of contents. Check through the index. Look at the appendixes. Thumb through the book without any particular plan, looking at the illustrations and reading bits here and there as you see things that interest you.

4. Look at the training course in more detail, to see how it is organized. Look at the table of contents again. Then, chapter by chapter, read the introduction, the headings, and the subheadings. This will give you a pretty clear picture of the scope and content of the book. As you look through the book in this way, ask yourself some questions: What do I need to learn about this? What do I already know about this? How is this information related to information given in other chapters? How is this information related to the qualifications for advancement in rating?

5. When you have a general idea of what is in the training course and how it is organized, fill in the details by intensive study. In each study period, try to cover a complete unit—it may be a chapter, a section of a chapter, or a subsection. The amount of material that you can cover at one time will vary. If you know the subject well, or if the material is easy, you can cover quite a lot at one time. Difficult or unfamiliar material will require more study time.

6. In studying any one unit—chapter, section, or subsection—write down the questions that occur to you. Many people find it helpful to make a written outline of the unit as they study, or at least to write down the most important ideas.

7. As you study, relate the information in the training course to the knowledge you already have. When you read about a process, a skill or a situation, try to see how this information ties in with your own past experience.

8. When you have finished studying a unit take time out to see what you have learned. Look back over your notes and questions. Maybe some of your questions have been answered, but perhaps you still have some that are not answered. Without looking at the training course, write down the main ideas that you have gotten from studying this unit. Don't just quote the book. If you can't give these ideas in your own words, the chances are that you have not really mastered the information.

9. Use Enlisted Correspondence Courses whenever you can. The correspondence courses are based on Navy Training Courses or on other appropriate texts. As mentioned before, completion of a mandatory Navy Training Course can be accomplished by passing an Enlisted Correspondence Course based on the Navy Training Course. You will probably find it helpful to take other correspondence courses, as well as those based on mandatory training courses. Taking a correspondence course helps you to master the information given in the training course, and also helps you see how much you have learned.

10. Think of your future as you study Navy Training Courses. You are working for advancement to third class or second class right now, but some day you will be working toward higher rates. Anything extra that you can learn now will help you both now and later.

SOURCES OF INFORMATION

One of the most useful things you can learn about a subject is how to find out more about it. No single publication can give you all the information you need to perform the duties of your rating. You should learn where to look for accurate, authoritative, up-to-date information on all subjects related to the military requirements for advancement and the professional qualifications of your rating.

Some of the publications described here are subject to change or revision from time to time—some at regular intervals, others as the need arises. When using any publication that is subject to change or revision, be sure that you have the latest edition. When using any publication that is kept current by means of changes, be sure you have a copy in which all official changes have been made. Studying canceled or obsolete information will not help you to do your work or to

CASE 8464

advance in rating; it is likely to be a waste of time, and may even be seriously misleading.

In addition to this training course, there are handbooks that provide specific and practical information for your rating. You are required to study them in order to attain your required professional qualifications. These handbooks are:

Publication	Applicable Rating
Food Operations Reference Manual NavSand P-421	CS3
Manual of Naval Preventive Medicine NavMed P-5010, Chapter 1, Food Sanitation	CS3
Navy-Marine Corps Recipe Service NavSandA P-7/MCO-P10110.16	CS3
Battle Stations in Food Service NavSandA P-338	CS2

A list of training films that may be useful to you is given in appendix I of this training course. Other films that may be of interest are listed in the United States Navy Film Catalog, NavWeps 10-1-777. This catalog, published in 1966, supersedes three earlier publications: the former catalog with the same title but numbered NP 10000-A; the Supplement, NavWeps 10-1-772; and Navy Classified Film Catalog, NP 10001-A.

As this book goes to press, the Navy is undergoing a major reorganization, in which certain bureaus will be redesignated as Systems Commands. The Bureau of Supplies and Accounts will be known as the Supply Systems Command.

Check Instructions and Notices for further information concerning this change.

8465

CHAPTER 2

THE FOOD SERVICE DIVISION

One of the first tasks of a trainee is to become acquainted with the organization in which he works and with the functions of that organization. This chapter will help you to see the general mess as a part of the supply department and to understand the lines of authority and the duties of the various personnel in carrying out its mission.

"The purpose of the general mess," as defines in the Bureau of Supplies and Accounts Manual, "is to provide Navy and Marine Corps enlisted personnel with a well balanced diet by proper preparation and service of the daily food allowances as authorized by the Navy Ration Law." In earlier years, each department had its own individual mess, and there was a wide variance in the food service. Today, on most ships and stations Navy men eat in one central mess hall, where modern cafeteria style equipment is provided to keep all items on the menu at the proper temperatures until they are served. An adequate supply of nutritious and appetizing foods is made available through compliance with the NAVY RATION LAW. Enacted by Congress, this ration law specifies the allowance of quantities of food to be issued daily by the general mess to each enlisted man of the Navy and the Marine Corps. The quality of the subsistence obtained, use of modern galley equipment, and strict adherence to the tested recipes of Navy-Marine Corps Recipe Service, (NavSandA Publication 7/MCO-P10110.16A) are important factors in maintaining the high standard of meals served throughout the Navy. Even more important than those factors, however, are the skills of the cooks, bakers, meat cutters, strikers, and other food service personnel. Also of major importance is the manner in which the duties and responsibilities of general mess personnel are organized—the extent to which that organization ensures smooth and efficient operation.

Although the general mess is a part of the supply department aboard all ships and stations, mess organization differs somewhat from ship to ship because of variations in the numbers of men to be fed and in facilities available. You should keep this in mind as you compare the organization and responsibilities described in this training course with those in effect aboard your ship or station.

OFFICER RESPONSIBILITIES

The commanding officer, executive officer, and medical officer, as well as the supply and food service officers, have certain responsibilities regarding the operation of the general mess. Their duties are outlined in the following paragraphs.

Command Responsibility

Your COMMANDING OFFICER has overall responsibility for the entire ship or station. He is responsible for taking all proper steps to preserve the health of the crew and consults the medical officer regarding sanitary measures to be adopted. The commanding officer establishes the hours for messing, according to the routine of the ship and the recommendations of the supply officer. In emergency conditions, the officer of the deck has authority to recommend changes in the messing hours. When messing changes are approved by the commanding officer, the officer of the deck notifies the supply officer and the food service officer. In the discharge of his responsibility to provide appetizing and wholesome food for his crew, the commanding officer approves, with his recommendations if any, the weekly menu which is prepared by the senior Commissaryman and forwarded through the supply department. He will designate an officer to be present and to sample each meal and to report if there is any cause for complaint on the quantity, quality, or service of the food.

The commanding officer makes periodic inspections of the mess hall and general mess spaces. In addition to those times, you will

8465
8466

probably see the commanding officer when you least expect it, because many COs have a habit of stopping by the galley now and then to see how things are going. You can be glad if your CO takes interest in your work because it will indicate the importance he places on it in the ship's activities.

The EXECUTIVE OFFICER is a direct assistant to the commanding officer. His responsibilities to the general mess include:

1. Assigning, to the supply officer, from departments other than the supply department, mess hall master at arms.

2. Detailing messmen for duty in the general mess.

3. Notifying the supply officer daily, in writing, of the estimated number of personnel to be fed and thereafter notifying the supply officer of any changes in such number, including the number of personnel hospitalized or absent with or without leave. He notifies the SO as far in advance of the meal hour as possible, of the number of personnel that will be absent during meal hours, including men on liberty and on working parties. Information regarding the number of rations to be reserved for personnel working parties or on special detail will accompany the original notification.

4. Preparation and submission of the Personnel Recapitulation and Mess Ration Credit (S. and A. Form 27) daily, monthly, and upon relief of the supply officer.

Medical Department Responsibility

The MEDICAL OFFICER, under the commanding officer, is responsible for the health and physical welfare of the ship's crew. He will inspect FOR QUALITY any fresh subsistence items brought aboard for the general mess and, when required, will inspect foods that have been prepared and are ready for service to determine if they are fit for consumption. At frequent intervals, established by the local command, he checks the preparation of meals, and reports to the commanding officer upon the sanitary condition of the mess. He examines all food-service personnel to determine if they are free from communicable disease, before they are assigned food service duties. In addition, a weekly "surprise" physical inspection is made by the medical officer of all food handlers in order to detect acute and chronic illnesses of a communicable nature. Another Medical Department responsibility for the general mess is the weekly inspection of all subsistence items in the storerooms and of the sanitary conditions prevalent in storage spaces and in the scullery.

Supply Department Responsibility

The mission of a ship's supply department, of which the food service division is a part, has been said to be "furnishing the maximum supply services possible for the command, the ship, and the crew, to the end that a significant contribution to the attainment and maintenance of the ship's maximum fighting efficiency has been made." In fulfilling this mission, the supply department provides the various other departments with the materials and services necessary for the accomplishment of their assigned functions, maintains prescribed records, renders pertinent reports and returns, pays the personnel aboard, and SUBSISTS ENLISTED PERSONNEL IN THE GENERAL MESS.

Ships With Supply Corps Officers.—When a Supply Corps officer is attached to a ship, the SUPPLY OFFICER under the commanding officer has overall responsibility for the operation of the general mess. This includes the following, (see fig. 2-1).

1. Preparation and service of food and supervision of these operations.

2. Supervision of Commissarymen, master at arms, messmen, and all other men assigned to general mess duties in the supply department and "on-the-job" training programs.

3. Cleanliness and good condition of all places where food is stored, prepared, and served, such as the galley, bake shop, and issueroom.

4. Ensuring that adequate supplies of subsistence items are on board at all times in sufficient quantities to meet normal requirements and any emergencies which may arise.

5. Assigning of personnel to duties in the general mess for which they are best suited by reason of their ability, training, and personality.

6. Reviewing inventories, actual issues, and such records as considered necessary so that timely action may be taken to ensure the continued availability of balanced stocks and to prevent the accumulation of excesses.

7. Inspecting, to ensure that subsistence items are stored in such a manner that the oldest pack, either export or domestic, will be issued first, except when the condition of a newer pack requires that immediate issue be made in order to avoid a loss.

On active fleet ships, when two or more supply officers are assigned, the supply officer

USAF 8467

can assign an officer assistant, as the food service officer to take charge of the general mess. Such officer will be held responsible for the overall operation of the general mess and for its financial accountability including signing the General Mess Operating Statement (S. and A. Form 45).

Ships Without Supply Corps Officers.—When a Supply Corps officer is NOT attached, the commanding officer is responsible for the administration of the general mess. The commanding officer may delegate operation of the general mess to any line officer in his command. The officer so delegated is designated as the supply officer but the commanding officer is responsible for the operation of the general mess and signing the S. and A. Form 45.

The designated supply officer ensures that the command, at all times, is supplied with items of subsistence in sufficient quantities to meet normal requirements and any emergencies which may arise. He is responsible for:

1. Original determination of requirements.
2. Receipt, inspection, and stowage of subsistence items.
3. Supervision of stock upkeep.
4. Inventory subsistence items when directed in writing by the commanding officer.

General Messes Ashore.—When one Supply Corps officer is assigned at shore activities operating a general mess, the supply officer performs both supply and food service duties. At activities requiring both supply and food service officers, the supply officer designates as officer assistant as the food service officer. Listed below are the duties normally performed by the supply officer and the food service officer:

Supply officer—is responsible for the following:

1. Procurement of subsistence items.
2. Custody of bulk subsistence stocks.
3. Sales and transfers of subsistence items.
4. Accountability of bulk subsistence stocks.
5. Submission of Navy Stock Account returns for subsistence.
6. Exercising general supervision over general mess activities.

Food service officer—is responsible for the following, (see fig. 2-2).

1. Operation of the general mess.
2. Issues of subsistence items made to the general mess by the supply officer and for the accountability thereof, including the preparation and submission of the subsistence returns.

Food Service Officer

In this training course, for the purpose of uniformity and simplicity, the term "food service officer" will be used to refer to any officer who is in direct charge of the general mess, afloat or ashore.

48.1

Figure 2-1.—Standard organization chart for a food service division afloat.

8468

48.2

Figure 2-2.—Standard organization chart for a food service division ashore.

The food service officer has custody of all subsistence items transferred to him for use in the general mess and is responsible for the performance of the men under him. He must see that his ship or station is at all times adequately supplied with subsistence items to meet both normal requirements and emergencies that may arise. He is responsible for making an original determination of normal and emergency subsistence items requirements, constant supervision of stock upkeep, proper receipt and inspection of subsistence items, proper stowage and storage practice, proper preparation and service of food in the general mess, and the preparation and submission of the subsistence returns.

Written orders are prepared by the food service officer defining the duties and responsibilities of each billet in his division. These orders are reviewed by the supply officer, where there is a food service officer as well as a supply officer, and are submitted to the commanding officer for his approval. After approval by the commanding officer, the orders are issued in the form of SUPPLY DEPARTMENT INSTRUCTIONS. Additional detailed instructions may be written by the food service officer, approved by the supply officer, and promulgated as Food Service Division Instructions. When a man is assigned to the food service division, or to a new job within the division, he is required to read that part of the instructions which apply to his job and to sign a statement that in the performance of his duties he will comply with the orders he has read. Whenever you are given such instructions to read, study them carefully, and be sure you understand them. Ask any questions that may occur to you. This is an opportunity for you to get a clear picture of your duties and responsibilities.

ENLISTED RESPONSIBILITIES

Enlisted personnel play a very important role in the actual operation of the general mess. In addition to Commissarymen, Commissarymen strikers, and Storekeepers you will find petty officers of other ratings, and nonrated men, assigned to certain duties in food service and related spaces. In most cases, these men will be serving as masters at arms or messmen. Detailed duties of these men are outlined in the following paragraphs.

Master at Arms

Mess hall masters at arms are detailed by the executive officer to the supply department for duty in the general mess. A mess hall master at arms reports to the supply and/or food service officer and coordinates his work with the senior Commissaryman and watch captains. The supply officer assigns the following detailed duties to the mess hall master at arms:

1. Responsibility for all spaces and equipment on the mess deck, serving line, and scullery.
2. Assigning messmen to cleaning stations, duty sections, and work details.
3. Mustering messmen daily and thoroughly inspecting them for personal neatness and cleanliness.
4. Maintaining order and discipline in the mess deck and mess lines.
5. Supervising the cleaning of the mess deck, serving line, scullery, and mess gear.
6. Ensuring that the scullery is operating in accordance with current and approved instructions.
7. Inventorying and maintaining adequate mess gear to ensure sufficient quantity will be available throughout serving periods.

OSAS 8469

8. Administering a training program for messmen, including sanitation, scullery operation, and food handling.

Messmen.—Messmen are the enlisted men detailed for food service duty in the general mess, including the actual serving of food, the maintenance of cleanliness and sanitation of the mess hall spaces and equipment, the operation of the scullery, and the handling and disposal of garbage. In addition, messmen may be detailed to work in the vegetable preparation room, and to wash cooking and baking utensils in the galley and bake shop. Messmen are under the supervision of the mess hall master at arms. Petty officers are not detailed as messmen, except when nonrated men are not available.

Records Section Personnel

The records section of the food service division is under the supervision of the food service officer. Normally, the enlisted men assigned to that section are Storekeepers or Storekeeper strikers. Although Commissarymen seldom have specific record keeping duties in the office, you should be aware of what records are kept, because they relate to your own duties and to the functions of the food service division as a whole. Working directly under the food service officer, the records section Storekeepers maintain all of the records, log books, and files of the division, including the subsistence survey log, subsistence ledger, inventory records, stock records, record of receipts and expenditure, general mess control record, correspondence files, and other local records.

Storage Space Personnel

In addition to the records section, there are two other food service spaces where you might find a Storkeeper at work. One is the subsistence issueroom, where the man in charge is traditionally called the JACK-OF-THE-DUST. The other is the cold storage room. In each of these spaces EITHER a Storekeeper or a Commissaryman may be assigned. On small ships, one man (the jack-of-the-dust) may be assigned to both spaces.

The COLD STORAGE MAN is the Storekeeper or Commissaryman in charge of the cold storage

48.3

Figure 2-3.—Organization of a general mess under Chief Commissaryman.

8470

spaces. He is responsible for the stowage condition, and issue of refrigerated and frozen subsistence items. Twice daily, or more frequently if required, he logs temperature readings of all the thermometers in refrigerated spaces. This log is submitted daily to the senior Commissaryman. Whenever a temperature reading exceeds the maximum of safety for food preparation, the cold storage man must immediately notify the food service officer through the senior Commissaryman. On small ships or stations, the jack-of-the-dust often is in charge of refrigerated spaces in addition to his issueroom duties, and a cold storage man is not assigned.

Commissarymen

The assignment of duties and responsibilities to individual Commissarymen and strikers is influenced by the personnel complement or allowance of the division. The size of the division is, in turn, determined by the size and mission of the ship. On large ships the duties of individual billets tend to be quite specialized. On smaller ships the duties of each billet usually cover a broader scope of activities. For example: On most of the larger ships and stations there are billets for a Chief Commissaryman and a galley captain, watch captains, spud coxswains, meat cutters, and bakers. When fewer men are available, the duties of some of these billets are combined. On very small ships, one Commissaryman may do all the cooking and baking, and be the meat cutter as well. In the latter case, one man assumes the responsibilities of all billets. You should keep these facts in mind as you study the duties and responsibilities of the billets described.

Senior Commissaryman.—The Chief Commissaryman, or the senior Commissaryman if there is no Chief aboard, is the supervising petty officer in charge of the general mess. By regulation, due to principles of accountability, he is prohibited from having either custody or control over the original records of subsistence items received and from preparing public vouchers for subsistence items. His main duties are confined to the galley, bake shop, and such other spaces assigned to him by the food service officer and the work directly connected therewith, including preparation and signing of the weekly General Mess Menu (S. and A. Form 1080) for submission to the commanding officer via the supply officer. The Chief Commissaryman or senior Commissaryman performs the following duties: (See fig. 2-3.)

1. Supervises the galley and associated spaces.
2. Sees that all equipment, fitting, cooking utensils, and other galley gear, are kept at maximum efficiency.
3. Reports to the supply officer, for corrective action, any needed repairs or alterations.
4. Supervises all personnel assigned to the galley and associated spaces.
5. Makes suggestions to the supply officer relative to the men making up the several watches.
6. Musters the personnel of the galley and associated spaces each morning, conducts an inspection of all personnel for cleanliness of person and clothing, and makes a report to the supply officer of his inspection findings, and also of absentees.
7. Supervises issues and preparation of food; instructs all personnel, so that food is prepared in the most economical, attractive, and appetizing manner possible within the allowed NAVY ration, using the NAVY-MARINE CORPS RECIPE SERVICE when possible.
8. Ensures that food is prepared or cooked as near serving time as practicable.
9. Ensures that every precaution is taken to prevent contamination of food, and carefully inspects all food before it is prepared or served.
10. If there is any doubt as to the quality of the food, reports same to the supply officer, who in turn may have proper determination made by the medical officer concerning fitness of the food for human consumption.
11. Prepares for the supply officer the WEEKLY GENERAL MESS MENU.
12. Submits to the supply officer each morning a report of all subsistence items issued to the general mess the previous day.
13. At his discretion, keeps such duplicate records concerning the receipt, inventory, and expenditure of subsistence items as may be necessary to schedule menus, ensure economy, and establish usage data necessary to the proper performance of his duties.

When there is no Supply Corps officer aboard a ship or station, the senior Commissaryman is the ranking specialist in the food service division.

Galley Supervisor.—On large ships, a senior Commissaryman other than the chief is often given special duties as the GALLEY SUPERVISOR. As directed by his supervisor (usually the Chief Commissaryman), he is responsible for planning and coordinating the various operations in the galley. It is his duty to be present before, during,

STAT 8471

and immediately after each meal. He observes food preparation procedures, the service of food, and cleanup operations in the galley. He gives advice and instructions, as necessary, to improve procedures, prevent waste, and to train personnel. The galley supervisor directs both watches, each of which is under the immediate supervision of a watch captain, and on many ships and stations he is responsible for drawing up the watch bill.

Watch Captain.—Whether or not the size of a ship warrants the assignment of a galley supervisor, the senior Commissaryman on each watch is traditionally given responsibility as WATCH CAPTAIN. Under the supervision of the Chief Commissaryman (or the galley supervisor), the WATCH CAPTAIN is responsible for carrying out the routine of meal preparation as outlined in the Food Preparation Worksheet (NavSandA Form 1090), and for the proper maintenance and security of the galley and related food preparation spaces. He also supervises the preparation of vegetables by the spud coxswain. He must see that all subsistence items and supplies in the galley are kept in shipshape order, with proper consideration for food preservation and sanitation, and that subsistence items are not diverted from their intended use.

The galley supervisor or the WATCH CAPTAIN gives on-the-job training to galley personnel on his watch, including instructions about the care and operation of equipment and the observance of safety regulations. He ensures that the men on his watch report for muster in clean uniforms, aprons, and hats and that they are personally clean and neat, with hair trimmed and nails short and clean.

It is also his duty to ensure that the receipes of the NAVY-MARINE CORPS RECIPE SERVICE are available and FOLLOWED at all times, and that all necessary precautions are enforced to prevent the use of spoiled, or otherwise unwholesome food. He personally supervises the preparation, cooking, and issuing of food to the messmen in the serving line, assigns a Commissaryman to supervise the messmen in the replenishment of foods on the serving line, and, before turning the galley over to the relieving watch, sees that all waste and scraps have been disposed of and that the galley is in a clean and neat condition.

Spud Coxswain.—The SPUD COXSWAIN is the Commissaryman, or striker, who is detailed by the captain of the watch for duty in charge of the vegetable preparation room and is responsible for its efficient operation. When the workload warrants, messmen are detailed to assist the spud coxswain in his duties.

Senior Meat Cutter.—The SENIOR MEAT CUTTER is the senior Commissaryman detailed for duty in the meat cutting shop. He cuts and issues meat for the galley and for special messes. Under the supervision of the senior Commissaryman, he is responsible for the cleanliness of the meat cutting shop and for the proper preservation of meats in cold storage. Except when subsistence items are being stowed or broken out, or during cleaning operations, no one is authorized to enter the meat refrigerating room other than the senior meat cutter or his Commissarymen assistants. On small ships, meat cutting duties are sometimes combined with those of the watch captain.

Senior Baker.—The SENIOR BAKER is the Commissaryman who is responsible for the efficient operation of the bake shop. He mixes, bakes, and finishes all types of bakery products, including baked desserts. As required, he prepares, mixes, and freezes ice cream. He requisitions supplies from the storerooms, maintains a tally of subsistence items used and on hand, inspects and stores supplies in the bake shop in a manner to protect them from deterioration, and cleans and maintains sanitary conditions in the bake shop. On large ships, the senior baker supervises those Commissarymen and strikers who are assigned to assist him in the bake shop. On smaller ships, in contrast, his duties may be combined with those of senior cook, and possibly even those of senior meat cutter.

WATCHES

Commissarymen work long hours—they must remain on the job until everything is secured after supper and be up early in the morning to prepare breakfast. Their work has many compensations, however—it is interesting and satisfying, and a watch system is established to give them sufficient time off at one stretch to balance the long periods when they are on duty.

Here is how the system works. The men are divided into two watches—port and starboard—which relieve each other at 1300 (or any designated midday hour) when everything has been secured after dinner. Ordinarily, each watch has the duty

IFP 8472

for 24 hours at a stretch. For example, the starboard watch goes on duty at 1300 Monday, prepares supper on Monday and prepares breakfast and dinner on Tuesday before being relieved by the port watch. The cycle is 24 hours on duty—and then 24 hours off. Some ships use a system of watches giving the men even more continuous time off. Of course, this does not mean that you work continuously for 24 hours when you are on duty. Between periods of preparing for meals and other related duties, men can be secured for rest and relaxation. There must, however, be at least one man on duty at all times during regular working periods.

INSTRUCTIONS AND SAFETY PRECAUTIONS

You probably have noticed a set of INSTRUCTIONS AND SAFETY PRECAUTIONS posted on the bulkhead of your galley. This is required aboard all ships and stations. In general, all cover the same basic matters, but they may vary somewhat in application according to the size and mission of the activity, the nature of equipment in use, the daily routine followed, or other considerations. You should study and learn the instructions for your galley and make it a habit to follow the ones that apply to your work. In fact, you will WANT to follow them, because

Galley Instructions

The following instructions are issued for the operation of the galley. The senior Commissaryman on watch will, under supervision of the Chief Commissaryman, be in charge of the galley during the period of the watch, and will be referred to as the "Captain of the Watch." He will comply with these instructions, require compliance by all personnel under his supervision, and during the period of his watch he will be responsible for ensuring that:

1. All subsistence items, supplies, and equipment in his custody are maintained in a neat and orderly condition and that subsistence items delivered to his custody for use in preparation of meals for the general mess are not diverted to other uses.

2. The menu is strictly adhered to and that the preparation, cooking, and serving of food is effected in a proper and appetizing manner.

3. Personnel do not smoke or use tobacco in any form in spaces utilized in the preparation of food.

4. Unauthorized personnel do not enter the galley spaces.

5. No "hand-outs" are made to anyone.

6. Personal clothing is not washed or hung to dry in the galley, and that no personal gear is stowed therein.

7. Personnel under his supervision are instructed and indoctrinated concerning the performance of their assigned duties, in the care and operation of all cooking equipment, and that prescribed safety precautions are strictly adhered to.

8. Extreme caution is exercised to prevent the issue of spoiled food and that all doubtful food is referred to the medical officer before it is used in the preparation of meals.

9. Personnel on watch remain scrupulously clean and neat, that their hair is trimmed and kept combed, that fingernails are kept short and clean at all times, and that they wear the prescribed uniform while on watch.

10. A copy of the NAVY-MARINE CORPS RECIPE SERVICE is maintained in the galley at all times and that recipes and instructions contained therein are adhered to in the preparation of items on the MENU.

11. Hash or cream-filled pastries on the menu are prepared immediately before serving.

12. All waste and scraps are properly and promptly disposed of.

13. All equipment and utensils are kept scrupulously clean and that the entire galley is in proper condition before it is turned over to the relieving watch.

14. All personnel on watch thoroughly understand and comply with pertinent instructions contained in supply department instructions regarding security measures.

15. Security of the galley, its related spaces, and all its equipment is maintained.

16. Any additional instructions of the food service officer are complied with.

48.3.0

Figure 2-4.—A typical set of instructions for posting in a ship's galley.

8473

you will see that they make sense. They are concerned with maintaining the galley as a clean, orderly workspace, keeping the equipment in tiptop shape, conserving Navy supplies, preparing first-class nutritious meals, and maintaining safety on the job, the security of the ship, and the health and welfare of all your shipmates.

You will find, too, that the instructions will make certain aspects of your job easier because they clearly point out some of the things that are not allowed, such as giving "hand outs" of food, or allowing unauthorized personnel to loiter around the galley. It is easier to say "No" to your friends when you can add, "It's against regulations."

Figure 2-4 is a typical set of instructions for posting in a ship's galley.

INDIVIDUAL RESPONSIBILITIES

As you studied this chapter, and learned about the functions of the food service division and the responsibilities attached to the individual jobs that are necessary to the operation of the general mess, you probably noticed how frequently the word "cleanliness" and its partner "sanitation" were mentioned. In fact, you probably came to the conclusion that in the food service division—CLEANLINESS AND SANITATION ARE EACH MAN'S RESPONSIBILITY—and that conclusion is correct! Foods and beverages that are not handled, prepared, and served in clean sanitary surroundings, by clean people, can become sources of disease and even death. Supplying clean, safe food is not only a responsibility that each Commissaryman and striker shares for the welfare of his shipmates, but it is essential to the attainment of maximum fighting efficiency for the entire ship.

Listed below are some of the daily health habits that, if followed, will protect your own health and that of your shipmates.

1. Take a bath or show daily to:
   a. Remove dirt, perspiration, and bacteria.
   b. Improve circulation, appearance, and health.
2. Wash hands with soap and water.
   a. FREQUENTLY while handling and washing dishes and utensils used by others. This protects you.
   b. ALWAYS after visiting the toilet, blowing nose, sneezing, etc.
   c. ALWAYS after handling garbage.
   d. ALWAYS after scrubbing the deck, cleaning the galley, etc.
3. Keep fingernails clean and short. This too, reduces transmission of disease and filth.
4. Keep hair confined and wash it frequently.
   a. Always wear a cap.
5. Keep teeth clean by brushing at least once daily, but preferably after each meal to:
   a. Inhibit tooth decay.
   b. Check unpleasant breath.
   c. Decrease chance of food infection from mouths of food service personnel.
6. Wear only clean inner and outer garments to:
   a. Reduce changes of transmitting disease and filth.
   b. Contribute to improvement of health and well-being.
   c. Help in eliminating offensive odors.
   d. Increase your self-respect.
7. Check yourself frequently for appearance and habits.
8. Report exposures to diseases and symptoms of illness to the medical department.

CHAPTER 3

INSPECTING SUBSISTENCE ITEMS

Before you buy an article for your own use you look it over. If you were buying several hundred, or several thousand, of the same article you would be even more particular. It isn't difficult then, to see why the Navy has set up a detailed inspection procedure to make certain that the millions of dollars worth of subsistence items it purchases each year meet Navy's standards as to quality and quantity.

RESPONSIBILITY FOR FOOD INSPECTION

In most instances, subsistence items will have been certified as to quality before they are delivered aboard your ship. However, there is always a chance for occasional error. Food products are highly perishable and may have deteriorated after they were inspected on the beach. There is also the possibility that some of the subsistence items, if purchased in an out-of-the-way place, may not have been inspected at all. In such a case you may be called upon to inspect them for quality. You can see how essential it is for you to know how to inspect subsistence items and what standards should be met. You will be guarding Uncle Sam's pocketbook, and—more important—ensuring that the Navy, and your shipmates, receive food that can safely be eaten.

Where Subsistence Items Come From

The ships of the Navy, for the most part, receive subsistence items from a Navy shore supply activity or a supply ship. Receipts from purchase and from other Government departments comprise a very small portion of the total volume of subsistence items. Before leaving port, a ship tops off with canned goods, flour, breakfast cereals, coffee, tea, sugar, frozen meats, and other items.

Perishable subsistence—meats, dairy and poultry products, fresh fruits, and vegetables—are obtained, while in port within the United States, either from a Navy shore supply activity or from dealers. Purchase contracts are made with dealers by field purchasing activities ashore. Information concerning these contracts is sent to all ships and stations in the area by means of a contract bulletin. This bulletin gives you the names and addresses of dealers from whom various types of subsistence items can be bought. Prices, descriptions, and inspection facilities are also indicated.

Nonperishable subsistence items are normally procured from a Navy shore supply activity or a supply ship.

Who Inspects for What?

Most subsistence items are inspected by a representative of the Department of Agriculture before being delivered to the ship. Aboard ship, the commanding officer requires a qualified representative of the medical department to inspect all subsistence items received from the local market or under contracts which require inspection at destination. The receipt document showing that a fitness-for-human-consumption inspection has been performed must be signed by the medical department representative. Items about which there is any doubt as to fitness should be rejected. Receipts from Navy sources and other Government departments have been inspected and additional inspection by the medical department is not required. Inspections required on receipts from these sources are performed by supply department personnel. If there is any doubt as to fitness for general mess use, the medical department representative should be contacted immediately.

Receipts From Naval Sources and Other Governmental Agencies.—Under ordinary circumstances, nonperishable subsistence items received from Navy sources and other governmental agencies in standard packages are presumed to be in the same condition as when

8475

they were originally certified. This condition is confirmed by the Navy inspection marks or other inspection stamps on the standard packages. However, the condition of the perishable subsistence items must be examined when they are received. Subsistence items found to be in an off condition or damaged, and for which the Government is liable, are reconditioned and used promptly if possible. Any loss or portion unsuitable for use is surveyed. The net weights marked on standard packages received from the Navy or other Government departments are accepted.

Receipts From Contractors.—Subsistence items received from contractors must be inspected to ensure compliance with the provisions of the purchase document. The inspection certificate is signed in the appropriate space on the Order and Inspection Report (NavSandA Form 48) by the person responsible for the quantity inspection and by the person responsible for the quality inspection. When partial deliveries are received, the food service officer indicates the quantities received and places his initials opposite the quantities indicated as having been received.

The medical officer or his representative inspects all subsistence items received from contractors to assure their fitness for human consumption. The food service officer retains the signed copies of all NavSandA Forms 48 under lock and key until the bills are forwarded for payment.

Storerooms and Galley Inspections

Daily and weekly inspections in the subsistence storage spaces must be made to determine the condition of stored foods. Checks must be made to ensure proper temperature and humidity in storage spaces, to determine condition of the items stored, and to guard against such intruders as bacteria, molds, rodents, and insects. Sanitary conditions must be kept at a high standard and temperature and storage charts should be maintained as required.

Although all foods that come into the galley have been inspected, you still have the responsibility of giving one last check before preparation. The medical officer should be called in to judge any doubtful subsistence items. Besides his periodic inspection of the food service spaces, he is always available to decide on any food that you may question. Don't hesitate to call on him. You can not afford to risk food posioning.

DO YOU KNOW GOOD FOOD?

Occasionally your ship may purchase subsistence items that have not been inspected by a Navy, or any other United States Government inspector. The next few pages give you some criteria by which to judge various foodstuffs. You will find this a handy reference for determining quality when you are called upon to assist in the purchasing and inspecting of subsistence items.

PURCHASED BREAD

The crust of good bakery bread is uniformly golden brown in color, with no light or dark spots. The loaf has good volume and is symmetrically shaped—neither low on one end and high on the other, nor bulging in the middle. The taste must be pleasing, and the aroma should be pleasingly sweet—not sour, musty, or moldy.

The desirable color for the inside portion, or crumb, is a creamy white. Remove a few slices and hold them to the light; they should have a healthy-looking gloss. Examine the grain of the bread. A close, even, uniform grain is desired. No open or coarse grains or large holes should show.

Be on the lookout for ROPE or MOLD. Rope is an undesirable condition caused by bacteria. Soft, sticky brown or yellow spots form in the bread crumb. Usually, the rope disease is not apparent during the first 18 hours after baking, but it develops rapidly after that time if the infection is serious and moist and warm conditions prevail. Temperatures of 85°F and above, particularly temperatures of 95°F to 105°F promote the development of rope.

Molds are microorganisms, visible to the eye as a furry growth. The most common color is bluish green. Molds grow best in an environment that is humid, preferably in the dark or in dim light and, usually, molds prefer warmth but not high heat. The best way to prevent these growths is to keep baked bread in a dry, sanitary place.

For further information on rope and mold, as well as other characteristics of bread, see the chapter in this text on baking.

INSPECTION OF MEATS

All meats procured for the Armed Forces are inspected. The Defense Subsistence Supply Center has the responsibility for implementing and carrying out the technical procurement

inspection programs. Such inspections are conducted by Army Veterinary Corps personnel, Defense Supply Agency Procurement Support Office personnel, and U.S. Department of Agriculture inspectors. The Defense Subsistence Supply Center requires inspection at place of origin to determine compliance with contracts. Receiving activities are responsible for destination inspections. This type of inspection is limited to identity, count, and condition. In some instances, meats are inspected at both origin and destination to verify compliance with contracts.

All major meatpacking centers, from which meat for the Armed Forces is procured, have Veterinary Corps personnel on duty to perform inspections. In many instances inspections are made in addition to those of Federal inspectors. The object of the military inspection is to: (1) protect the health of the Armed Forces against diseases transmitted through spoiled, damaged, or contaminated food, and (2) determine if the foods of animal origin are of the quality indicated in the purchasing document.

After products are inspected, stamps are imprinted on the meat to designate compliance with Federal meat inspection laws and that they meet the requirements of Federal specifications. Subsistence personnel should become thoroughly familiar with these stamps. See figure 3-1.

Beef

Both fresh and frozen beef are procured for the Navy in two styles, carcass or standard wholesale market cuts.

Carcass beef specifications call for steer or heifer beef carcasses. The grades specified are those used largely in the shipping trade and by hotels and restaurants. Carcasses are characterized by superior conformation throughout. Conformation means the shape, thickness, or amount of meat on the carcass. Carcasses in the "good" grade (C) are characterized by superior conformation as shown by short, thick necks and shanks, and by well developed ribs, loins, and rounds. Quality is evidenced by a bright, cherry-red color, lean that is fine-textured, plus a lacy-like mixture of fat, within the lean, called marbling. Top grade carcasses are finished with a creamy white hard fat evenly distributed over the thicker parts of the carcass. Therefore, the three things you would look

DEPARTMENT OF AGRICULTURE INSPECTION STAMPS

These stamps indicate that meat and meat food products are prepared in plants operating under Federal meat inspection regulations of the USDA.

DEPARTMENT OF AGRICULTURE (MEAT INSPECTION DIVISION)

This stamp indicates compliance with Federal specifications for military procurements of meat and meat food products.

DEPARTMENT OF DEFENSE INSPECTION STAMPS

These stamps indicate that meat and meat food products have been inspected by Veterinary Corps personnel.

48.4:.5

Figure 3-1.—Meat inspection stamps appearing on meat or packages of meat.

8477

for in grading beef are quality, finish, and conformation. Standard wholesale market cuts include the rib and the round. The cuts are prepared and handled according to the specifications for each respective style, class, grade, state of refrigeration, and weight range.

Frozen boneless beef, procured under current specifications, is obtained from forequarters and hindquarters. It is labeled "Beef, boneless, frozen, fabricated, 6-way." Delivery from the packers is in complete units consisting of the following: portion-cut grilled steaks 13.50%; oven roasts 16.50%; portion-cut swiss steaks 11.00%; pot roast 15.00%; diced beef 10.00%; and ground beef 34.00%.

Veal

Veal is procured for the Navy as frozen semiboneless (chops, roasts, stews) and frozen boneless fabricated (slices — cutlet type and flaked steaks). Typical veal carcasses have grayish pink lean that is smooth and velvety in texture.

Lamb

Frozen lamb carcasses and frozen wholesale market cuts (leg and loin) are procured for the Navy. Lamb carcasses always have break joints on their shanks and generally have narrow rib bones, a rather regular contour, and a light red color and fine texture of lean. Carcass lamb must weigh not less than 30 pounds and not more than 55 pounds.

Frozen telescoped lamb which is procured for the Navy is dressed lamb. The carcasses are cut in the following manner: lower foreshanks are cut at the knee. Hind legs are cut squarely from the carcass. Lower hind legs are removed. Removed legs are placed inside the chest cavity. The carcass is then tied so that the long cut front touches the back cut legs, and the flanks are stitched.

Pork

The Navy procures fresh and cured wholesale cuts of pork. The fresh cuts, which may be delivered chilled or frozen are: pork butts; short shanks; pork hams; bladeless pork loins; string tied pork loins; partially boned pork loins; pork spareribs; and pork tenderloins. Fresh lean cuts should be well-developed and fine grained. The fat should be white and firm.

Cured wholesale cuts of pork are chilled or frozen smoked ham and frozen boneless cooked smoked ham. They are prepared and handled according to specifications and must meet the Navy requirements for weight.

Rabbit

Rabbit, frozen, ready-to-cook, cut-up is procured for the Navy according to Navy specifications.

Meat Products

All of the following meat products which are procured for use by the Navy are also prepared and handled according to Navy specification for the style, class, grade, state of refrigeration, and weight range for each specific item:

- Bacon, procures as slab, sliced or pre-cooked
- Beef, corned, brisket
- Beef, liver
- Bologna
- Cervelat
- Frankfurters
- Liver sausage
- Luncheon loaf, pickle and pimiento
- New England style sausage
- Pork sausage, mold style and unlinked style
- Salami, cooked and dried

POULTRY

The high quality, eviscerated poultry (frozen chicken, broiler-fryers and fowl, duck, and turkey) which is procured for the Navy must meet Federal specifications. It should be inspected for deformities, cuts, bruises, and plenty of firm, well-bled flesh.

The following types of poultry items are procured for Navy-wide use:

1. Chicken, frozen, broiler-fryers, ready to cook, cutup, without backs, necks, or giblets, grade A.
2. Chicken, frozen, fowl (hen) ready to cook, whole, grade A.
3. Duck, frozen, ready to cook, whole, grade A.
4. Turkey, frozen, ready to cook, whole, grade A.

FISH AND SHELLFISH

Fish and shellfish, both fresh and frozen are procured for Navy use. Frozen fish fillets (cod, flounder, haddock, mackeral, perch, rockfish,

8478

and whiting) and frozen fish steaks (halibut, salmon, snapper, and swordfish) are prepared and handled according to Federal specifications. Also frozen shellfish, such as shucked clams, crawfish, shucked oysters, scallops, shrimp, lobster, and fresh crawfish and lobster are procured. Requisition the type and form (fillets or steaks) by the correct Federal stock number to ensure receipt of the item desired. Check the fish carefully. Do not use refrozen fish; that is, fish that has been frozen, thawed, and then frozen again. Fish that has been refrozen will have soft, flabby flesh, a sour odor, and an off color. The wrapping paper may become moist, slimy, or discolored. The bottom of the box as positioned in the freezer, may contain a layer of ice, and the box may be distorted.

FRESH VEGETABLES

Standard grades for vegetables were developed by the United States Department of Agriculture, and the Navy bases its inspection on those standards. When deliveries are made, inspections must be conducted to find out if specifications have been met. Because of their perishability, fresh vegetables must be handled with care. Do not pinch, squeeze, or touch them unnecessarily for bruishing leads to decay and results in early spoilage. The vegetables listed below are procured for the Navy. The quality characteristics to look for when inspecting are included also.

ASPARAGUS.—Look for straight, fresh appearing stalks, crisp and tender, with compact pointed ends and only 1 inch or so of tough woody base to cut off.

BEANS.—Green or waxy yellow (wax beans)-should have long, straight pods, crisp enough to snap easily between your fingers. When the beans start to ridge and bulge the pods, they usually are old, tough, and leathery.

BEETS.—Look for good, globular shape with smooth firm flesh. Medium sized beets are less likely to be tough than very large ones.

BROCCOLI.—Look for plenty of green color in the heads as well as the leaves and stems. Stalks should be tender and firm with compact dark green or purplish-green buds in the head.

BRUSSELS SPROUTS.—Good "sprouts" are hard, compact, and of an attractive green color, while puffiness, wilted appearance, or yellow color all indicate poor quality.

CABBAGE.—Look for well-trimmed, solid heads that are heavy for their size and show no discolored veins.

CARROTS.—Check for bright colored carrots that are well shaped and medium sized. Carrots about $1^1/_2$ inches in diameter are usually a fine quality.

CAULIFLOWER.—A jacket of bright green denotes freshness. The head should be white or creamy white, clean, and solidly formed. If the flower clusters are spread or open, the vegetable will be of poor quality.

CELERY.—Quality characteristics for both the bleached and the green celery are the same. Leaf stems or stalks should be brittle enough to snap easily and of medium length and thickness. The inside of the stem should be smooth. If it feels rough or puffy to your fingers, the celery is likely to be pithy.

CORN.—May be either white or yellow. The husk is a fresh green color, while the kernels are tender, milky, and sufficiently large to leave no space between the rows. Ears generally should be filled to the tips, with no rows of missing kernels.

CUCUMBERS.—The best cucumbers are firm in texture and bright green in color. The older ones tend to be a deep black-green or sometimes yellow. Cucumbers of less than 7 inches in length and about 2 inches in diameter are best.

EGGPLANT.—Purple eggplants should be of a clear, dark, glossy color that covers the entire surface. Heaviness and firmness of flesh are important. Choose pear-shaped eggplant from 3 to 6 inches in diameter. Decay shows up in dark brown spots. Wilted, soft, or flabby eggplants should be discarded.

ENDIVE.—Curly endive grows in a bunched head with narrow, ragged-edged leaves which curl at the ends. The center of the head is a yellowish white and has a mild taste while the dark green outer leaves have a bitter taste.

ESCAROLE.—Escarole is a variety of endive. The leaves are broad and do not curl at the end. Crispness, freshness, and tenderness are the essential factors of quality.

GREENS.—Collards, kale, mustard, spinach, and turnip tops are the greens authorized for general mess use. Good quality greens must be fresh, young, green, and tender. Poorly developed, dry, or yellow leaves or insect-eaten leaves are not good. Coarse stems indicate poor quality.

LETTUCE.—"Iceberg" lettuce, usually purchased for the Navy is tightly headed lettuce, medium green on the outside with a very pale green heart. Discolored areas on the leaves indicate decay. Soft rot sometimes penetrates to the center of the head.

ONIONS.—Spanish and American types of onions, both grown in the United States, are

0848 8479

used by the Navy. Dry onions should be bright, clean, hard, well-shaped, and dark-skinned. Moisture around the neck indicates decay.

ONIONS, GREEN.—Should be fresh in appearance, should have fresh green tops and medium-sized necks which are blanched for at least 2 or 3 inches from the roots, and young, crisp, and tender. Bruised, yellow, wilted tops indicate poor quality and may indicate poor quality necks. The condition can be ascertained by puncturing with the thumbnail and twisting.

PARSNIPS.—Young parsnips, $1\frac{1}{2}$ to 2 inches in thickness and free from rust spots, are the best. Withered parsnips are old, tough, and have a strong flavor.

PEPPERS.—Should be well shaped, thick walled, and firm, with a uniform glossy color. Pale color and soft seeds are signs of immaturity while sunken, blister-like spots on the surface indicate that decay may set in rather quickly.

POTATOES.—Good quality white potatoes are generally clean, firm, and free from cuts, growth cracks, and other knobs or surface defects. Watch for frost-damaged potatoes which generally have a watery appearance or show a black ring near the surface when cut across.

SWEET POTATOES.—Thick, chunky, medium-sized sweet potatoes which taper toward the end are the best. Avoid those with any sign of decay, as such deterioration spreads rapidly, affecting the taste of the entire potato, even in portions not immediately adjacent to the decayed area.

RADISHES.—Good quality is indicated by the root which should be smooth, crisp, and firm, never soft or spongy.

RHUBARB.—Fresh, large, crisp, and straight stalks of red or cherry color are best. Condition of the leaves is a reliable guide in judging the freshness of the vegetable.

RUTABAGAS.—Good quality rutabagas should be smooth-skinned, firm, and heavy for their size.

SQUASH.—Avoid hard rinds on the following:

Buttercup—shaped somewhat drum-like with sides slightly tapered near the apex.

Zucchini—cylindrical straight, with fairly square ends, skin color moderately dark green over a ground color of pale yellow.

Yellow straight-necked or crooked-necked—very brilliant light yellow color. Hard tough rinds are desirable however on the following as soft rinds are apt to have a watery flesh which is flat to the taste:

Acorn—acorn-shaped and very dull, blackish green with dull orange interior.

Hubbard—medium to large size best.

TOMATOES.—Look for tomatoes that are firm, plump, fairly well formed, of good color, (green out of season and bright red in season) and free from blemishes. They are one of the tenderest products and must be handled with care. Misshapen, angular, ribbed or scarred tomatoes are of poor quality.

TURNIPS.—Smooth skin, firmness, and good weight for their size are qualities to look for.

FRESH FRUITS

Inspections of fresh fruits are based upon standards of the United States Department of Agriculture. Due allowances, however, are made for differences in these grades or standards, but minimum requirements are defined for the various grades.

Generally speaking, the choice of any particular fruit is influenced by appearance and quality. However, you should consider the following factors in inspecting fruits: APPEARANCE (absence of blemishes), SIZE, and TASTE. Appearance is an indication of quality but must not be used as the sole standard in inspecting. Blemishes indicate poor quality or the beginning of decay. The larger the fruit, the more woody and coarse it usually is. Taste, however, is the best indicator of quality. Occasionally, fruits may have surface blemishes and the quality still may be high. Only by tasting can this quality be determined.

Standards for inspecting fruits are applied in the following descriptions.

APPLES.—The best grades of apples are firm and have good color (bright and unspotted) and a pleasant flavor. Immature apples have a poor color, lack flavor, and shrivel after storage. Tart apples are best for most purposes. Soft, mealy, or overripe apples should be avoided.

BANANAS.—The color and condition of the peel are good indications of the use that should be made of bananas. When the skin is all yellow, the banana is firm enough and ripe enough to be eaten. If the peel is yellow but flecked with brown, the banana is fully ripe and should be used immediately. Fruit with a moldy skin that has turned black is of poor quality, although some bananas with a dark skin are very ripe but still good eating.

CANTALOUPES.—There should be no trace of a stem at the blossom end. If the netting covers the cantaloupe thickly and stands out like a whipcord, the melon is generally good. An apparent softness at the blossom end is no sure indication of maturity, as repeated pressure from handling will produce this condition. Fully

8480

ripe cantaloupe will have a delicate aroma, while an audible rattling of the seeds in a melon, when shaken, is another sign of maturity. The skin beneath the netting usually has a yellow tinge. Too deep a yellow indicates overripeness.

CHERRIES.—High quality is denoted by plumpness with a bright appearance and good color.

GRAPEFRUIT.—Fine juicy grapefruits are well rounded in shape and heavy for their size. They are firm, but springy, to the touch; not soft wilted or flabby. When grapefruits have a course skin or are puffy and spongy it indicates lack of juice and taste.

GRAPES.—Color is a good guide to ripeness. The darker varieties should be free of a green tinge, while the white grapes should have a decided amber coloring. The fruit is plump and each grape is firmly fastened to the stem. A wet condition, or the presence of mold, indicates decay.

HONEY BALL MELON.—Prime-quality honey ball melons have a thick green-colored, sweet, fine-flavored flesh with a distinct, pleasant aroma. The rind has a light-yellowish color and yields slightly to pressure. Decay is generally indicated by mold or dark, sunken, watery areas.

LEMONS.—The best lemons have a greenish-yellow color with a smooth, fine-textured skin, and are heavy for their size. Mold or soft spots at the end indicate decay. If too springy, they may be decayed in the center.

NECTARINES.—Nectarines look and taste like small peaches except that they do not have "peach fuzz." They are red, white or yellow fleshed in color and are chosen for their plumpness and firmness.

ORANGES.—The skins of good oranges should be yellowish orange, smooth, and fine-textured. Avoid those that have badly creased skins or a puffy spongy condition and are light in weight for their size. When inspecting for quality, be sure that the crate does not contain decayed fruit.

PEACHES.—Quality in peaches is indicated by the general appearance and firmness of the flesh. They should be smooth skinned and well filled out. The color on the underside should be creamy white or yellow blushed with red. Overripeness is indicated by deeper reddish brown color and softness of the fruit.

PEARS.—Good quality pears are firm and shiny. Pears are packed and shipped green because it is characteristic that they develop a fine flavor and smoother texture when ripened off the tree. They should be full ripe for fresh use. If they are hard and unyielding to the touch at time of receipt, allow them to stand at ordinary room temperature until the flesh responds readily to a gentle pressure of the hand. They are then in prime condition for eating.

PINEAPPLE.—Fully ripe pineapples are slightly soft to the touch, golden yellow in color, and have a "piney" aroma. Fruit that is too green may not ripen well. Overmaturity is shown by slight decay at the base or on the sides by dark, soft, watery spots.

PLUMS.—Good plums should be full-colored and soft enough to yield to slight pressure. Some varieties are fully ripe when the color is yellowish green; others when the color is purplish blue or black. If hard, poor in color and flavor, the fruit is immature. Overripe fruit is soft and usually leaky.

STRAWBERRIES.—Quality in strawberries is indicated by the general appearance. They should be firm, plump, and bright red in color. Overripe berries are leaky, dull in color, and should not be used. Mold at the surface indicates decay.

TANGERINES.—Tangerines are small yellowish red oranges with easily removable skins and loosely adhering sections. Quality is based mainly on weight for size and deep yellow or orange color of the skin.

WATERMELONS.—A fully ripe watermelon has a thin outer skin that peels easily when scraped with the fingernail. The underside changes from white to yellow tinge with maturity. The safest way to determine watermelon quality is by "plugging."

CANNED PRODUCTS

In the event you are assigned to the inspection of canned products, such as meats, fish, poultry, vegetables, fruits, and juices, you should take into consideration the following:

CAN SIZE.—Make sure cans are the size requisitioned.

CAN LABELS.—Check the information stamped on the end of each can, and be sure that contents and date of pack are indicated.

CAN EXTERIOR.—Examine the exterior of the can for general appearance, dents, swelling, rust, and pinholes. Dents, unless so severe as to cause leakage, do not indicate that the contents are in an unsatisfactory condition. Rust does not injure the food unless it penetrates the can. Pinholes are found only by careful inspections.

CAN INTERIOR.—Remove the contents and check the inside of a sample can very carefully. It may be necessary to rinse the can thoroughly and then refill with water to detect very small pinholes.

8481

CONTENTS OF CAN.—Odor and taste indicate the condition of food. Fading of color, loss of flavor, and softening of contents are due to chemical action and natural aging processes. Discoloration is another defect caused by a chemical action found usually in products containing sulphur compounds; that is, corn, peas, and meat products.

Unsatisfactory Cans

Except for coffee, which is discussed later, foods contained in the following types of cans are found to be unsatisfactory and should be surveyed. Canned food that is abnormal in appearance or odor should never be eaten or EVEN TASTED.

PINHOLE CANS.—These are cans with tiny holes caused by the action of acid in the food.

SWELLS.—These are also called "swellers." Both ends of this type of can bulge out and remain that way. This condition is caused by chemical action of bacteria (microorganisms) in the foods which results in the freeing of a gas (hydrogen sulphide). This gas cannot escape and gains room only by bulging out the end of the can.

SPRINGERS.—The ends of this type of can are also bulged out, but they will yield to pressure of the fingers or thumb. When the pressure is relieved, the ends bulge out again. This condition may be caused by overfilling the can or by chemical or bacterial action on the food freeing gas which causes the swelling condition.

FLIPPERS.—This term describes a can, the ends of which are flat. However, one end may be forced into a convex condition when the other end of the can is brought down sharply on a flat surface. It indicates a loss of vacuum in the can from formulation of gas by bacteria or by chemical action on the metal of the can. Regardless of the cause, the contents should not be used.

Coffee

Coffee is an exception to the above. Care must be taken NOT to reject cans of roasted and ground coffee showing swell or springer characteristics. Swellers that develop in coffee are usually an indication of a properly sealed container that has retained its natural gases. The gas, replacing the original vacuum created in the can, expands.

When coffee in any sweller or springer can is of uncertain quality, report it to the commissary officer via the senior Commissaryman.

DRY STORES

DRY STORES, aside from canned goods, are such foods as cereals, sugar, dried fruits, vegetables, flour, and meal. They must be stored under controlled conditions of temperature, humidity, and air circulation.

Insects can cause great damage to stored food; attacking both natural and manufactured food. Food stored at temperatures between 60° and 90°F are especially attractive to insects.

In inspecting dry stores, remember that United States Department of Agriculture standards were followed at the time of purchase. The main things for you to check are the following: (1) OUTWARD APPEARANCE of the food, or food containers; and (2) CONDITION OF THE FOOD ITSELF. Flour and meal bags, for example, may be torn and the food exposed to bacteria. Rolled oats or other cereal containers may be broken and the food contaminated. Dried vegetables may be damp and moldy.

DAIRY PRODUCTS

Dairy products spoil quickly under improper storage conditions. The method of handling and the storage temperature must be correct. It is necessary that you check them carefully upon delivery, and frequently thereafter until they are consumed.

MILK AND CREAM.—Dairy products are purchased in accordance with Government standards. They are shipped in cans, or approved fiber containers. When delivered to you, check the containers for visible foreign matter, cleanliness, and leaks, and ensure that the medical representative has inspected them. Temperature of milk delivered to naval establishments should never exceed 50°F. In hot weather, taste the milk for freshness. It is important that you make a daily check on the temperature of the boxes in which milk and cream are kept. The temperature should be close to freezing, 32°F.

BUTTER.—Butter should reach you in clean, unbroken cases. The inspection stamped on the case should indicate the weight and the grade of the butter. For quality, it is best to taste samples for sweetness and freshness. The color should be uniform and the texture firm. No specks or foreign substance should be present.

CHEESE.—Check the rind, color, flavor, and texture of cheese. It may be delivered to you in either natural or processed form. The rind should be clean, and free from molds or wrinkles. The color should be evenly distributed through good

8482
1848

cheddar cheese. You can tell this by holding a thin slice in front of a light. The flavor of good cheese is clean and "nutty," and the texture compact and solid. There should be no breaks or holes in the surface of the cheese.

EGGS.—Eggs are purchased in accordance with Navy specifications. When eggs meet specifications the containers are marked at the time of delivery by the inspector to show their grade and the date of inspection. Various types are procured to meet all kinds of conditions, temperatures, and uses.

Fresh eggs not over 30 days old are the preferred type. They have never been in cold storage, and have been held at a temperature between 40° and 50°F. Storage eggs have been stored at temperatures of about 29 - 31°F.

Dried, whole eggs have many advantages over fresh shell eggs. Such eggs occupy less space, effect a considerable saving in weight, and are ready for instant use without laborious inspection and separation from the shell.

Processed cold storage eggs have been preserved by dipping them in hot mineral oil at 200°F for 6 seconds. The hot oil seals the pores of the eggs, retards shrinkage by evaporation, and destroys molds and bacteria, thus prolonging the life of the egg. Processed eggs keep longer and retain their original flavor better than untreated eggs.

8483 8848

CHAPTER 4

STORAGE AND CARE OF SUBSISTENCE ITEMS

Storage of subsistence items is important to a Commissaryman because conservation of foods and their availability for use are both dependent to a great extent on proper storage procedures. Correct storage is also an important aspect of the sanitary precautions that are so necessary to prevent foodborne illness.

Three factors of major importance in all storage, no matter what material, are safety, accessibility, and orderliness. This chapter defines standards of acceptability on each of these factors for the various types of subsistence items and discusses how such standards should be maintained.

SAFETY.—Materials must be stored so as to prevent injury to the ship and the crew and to prevent damage to the material itself. Articles stored overhead and upon the tops of bins must be secured with particular care because the lashings or other means of securing are subjected to heavy strains while the ship is underway. This means of securing should be inspected frequently and renewed upon the first sign of wearing.

Other very important factors that contribute to the actual SAFETY of the material are TEMPERATURE, AIR CIRCULATION, and HUMIDITY. These factors are discussed throughout the chapter. Tables given with the various kinds of commodities specify temperature, relative humidity, and safe-keeping time of individual perishable and nonperishable subsistence items.

ACCESSIBILITY.—Supplies must be arranged in stowage so as to facilitate breakout. Articles that are issued most frequently should be stored nearest the breakout area. Whenever practicable, avoid stowing an item on top of or behind an item of a different kind. (Failure to observe this rule causes slow breakouts and slow and inaccurate inventories.) Items must be stored so that, under ordinary conditions, the oldest stock will be the first issued.

ORDERLINESS.—Case goods should be stacked neatly in their storage area so that they can be counted by sight without being moved.

These three factors are closely inter-related and must be considered together. For instance, if, for the sake of accessibility, you leave cases of canned goods stacked in the passageway, or if you do not secure them properly, you will violate rules of safety and orderliness. If such a practice were carried to an extreme, you would eventually have such confusion that accessibility would suffer also. Because the factors are so closely linked, they are considered together throughout the chapter.

This chapter is organized according to types of subsistence items and considers the rules of storage applicable to each.

NONPERISHABLE SUBSISTENCE

The term "nonperishable subsistence" refers to food items that are canned, dried, dehydrated, or otherwise processed to the extent that such items may, under normal conditions, be stored in nonrefrigerated spaces. While nonperishable subsistence is not nearly so prone to spoilage as fresh subsistence, spoilage can and will occur if the items are mishandled, improperly stored, or stored too long. Always remember that the length of storage should be based on the packing date of the product and not the date of receipt.

Storage Principles

When possible, store nonperishable subsistence items in clean, cool, dry, well-ventilated storerooms. Check all items at regular intervals for signs of damage. Keep your storerooms clean to prevent the contamination of bagged foods by dirt and dust.

Segregate and clearly mark shipments so that the oldest lots — as packed, not as received — are issued first. However, if newer lots show signs of deterioration or spoilage, issue them first.

Methods of storage depend on the size and the contents of the container, and the bursting or breaking strength of the bottom layers. Care

8484

123 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

must be taken not to stack items too high. This will cause a bursting or crushing of the bottom layers.

Do not stack items near steam or other heated pipes. Use pallets to raise the subsistence items off the deck and stack individual lots so as to permit proper circulation of air around the lots.

Bagged items and those requiring fumigation and insect control should not be stored in large masses in corners of the storeroom or directly against the bulkhead; this type of storage will not permit sufficient room for cleaning and inspecting. Whenever practicable, palletized storage should be used to ease the handling of the stores and reduce losses through breakage in handling. Cross stack items to keep the stack solid and prevent it from toppling.

The safe storage period for nonperishable subsistence items varies greatly, depending on such elements as temperature, humidity, care in handling, protection from the weather, quality of the food when received, and the packing. Subsistence that has been on hand beyond the safe storage limit should be inspected for spoilage, leakage, or other damage. If such items are in good condition, use them as promptly as practicable. Survey all items unfit for human consumption.

Causes of Spoilage

Age, bacteria, yeasts, molds, insects, rodents, and environmental factors contribute to the deterioration of all foodstuffs.

Age is one of the contributing factors in food spoilage. This factor compels an observance of the basic principle of storage that the oldest lots of the item should always be used first, except when the condition of the newer item is such that it must be given priority.

Bacteria, yeasts, and molds are the primary causes of food spoilage. Canned foods may be spoiled by bacteria which have survived the canning process or by bacteria which have gained access to the can through imperfections in or damage to the containers. Spoilage is evidenced by the development of gas and in most cases by a foul odor or bad taste. Yeast growth creates damage, particularly at temperatures between 77° and 95°F, to products with a sugar content, such as honey, sirup, dried fruits, sweet beverages, fruit concentrates, and canned fruits.

Molds produce visible threadlike filaments, musty odors, and off-flavors in the product in which they are growing. Surface molds on firm textured foods such as meats and meat products are not necessarily harmful. You can remove such molds by brushing with a stiff bristled brush and then wiping with a clean cloth moistened with a vinegar or salt-water solution. Heavy mold may be removed by trimming with a knife.

Insects can and do cause great damage to stored food, attacking both natural and manufactured food. Roaches and flies not only contaminate the foods but may spread disease. Foods stored at temperature between 60° and 90°F are especially attractive to insects. When supplies are not too heavily infested with some insects they may be reconditioned for use. Use insect repellents carefully so as not to contaminate the food or cause damage by absorption of the fumigant or insecticide flavor into the food.

Rodents (rats and mice) not only physically destroy food by feeding, chewing, and cutting the bags for nests or nesting material, but also contaminate food with their excreta and hairs. They are carriers of filth and disease. The most effective method of control is to prevent the entry of these animals into the storerooms.

Physical environmental factors that contribute to the spoilage of nonperishable subsistence include freezing, heat, moisture, lack of ventilation, and exposure to light. Dry products such as grains, flour, sugar, starch, cereals, and dehydrated foods, ordinarily are not injured by freezing. If canned foods containing large amounts of water are frozen accidently, the usefulness and taste of the products will not be harmed. However, the physical appearance may suffer by softening. Emulsions such as canned cheese and butter, prepared mustard, and mayonnaise will separate and appear unpalatable, although the food is not spoiled.

A high storage temperature over long periods of time is very detrimental to most food products. It encourages bacterial growth, mold growth, and insect infestation. Flour and associated products (barley, cereals, corn meal, cornstarch, crackers and biscuits, hominy, noodles, oats, rice, spaghetti and macaroni, tapioca, and uncooked wheat) are made more subject to insect infestation by heat. When storing flour and cereals, keep them away from materials which give off distinctive odors. Store any items that are not sealed in metal containers away from moisture and odor producing materials.

Moisture hastens the growth of insects, bacteria, and molds, and sometimes causes mustiness in flour, rice, and similar foods. Check your dried vegetables and fruits at frequent intervals to determine if this condition exists.

8485

123

8485

Dehydrated products are perishable and should not be handled or stored carelessly. They are subject to moisture absorption, insect infestation, and mold. Loss of flavor and discoloration (darkening) will occur with age; this action is progressive, and is hastened at high temperature.

Improper ventilation and too much light can also add to the deterioration of foods. Where you have sharply fluctuating temperature and high humidity, the lack of proper ventilation may cause very high temperatures. Proper ventilation is one of the most important factors in protecting foods, particularly in tropical areas.

Damage from light is restricted to products that are packed in glass or transparent containers. Exposure to light causes color changes and may affect the flavor of foods containing, or composed of, edible oils and fats.

TABLES OF SAFE-KEEPING TIME AND STORAGE DATA FOR NONPERISHABLE SUBSISTENCE ITEMS

Information listed in the following pages is your guide in determining the average storage life of the listed items under existing conditions. Because of day-to-day changes in conditions of temperature and relative humidity, it will be necessary to consider both the average and the extreme to which products have been exposed. The type of packaging protection must also be considered.

When a product reaches the maximum age specified for a given temperature, it is not necessarily spoiled. It has merely reached the age at which experience has shown that a product of this type, under the specified conditions, should be suspected of deterioration. If a product exceeds the maximum storage age shown on the table, and you have any doubt concerning its condition, have a representative from the medical department inspect it to determine its fitness for human consumption.

Meat, Poultry, and Fish

Canned meat, poultry, and seafood products; and canned dehydrated meat, poultry, and seafood products will deteriorate to some extent at very high or very low temperature, and the container is subject to damage from high humidity combined with changing temperature. When storing the above products, place them on racks or dunnage in a moderately cool, dry place. The best storage temperatures are 30°F to 80°F, and a relative humidity of 60 percent. Always rotate your stocks to ensure that they are used well in advance of the recommended safe-storage periods. Refer to table 4-1 when storing canned meat, poultry, and fish.

Table 4-1.—Storage Data for Canned Meat, Poultry, and Fish

48.77.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Canned meat, poultry, and fish						
Meat					Temperatures above 90°F hasten deterioration	Deterioration resulting from age is evidenced by rancidity, softening of the meats, fading of color, and loss of flavor.

Meat—Continued						
Pork						
Bacon, sliced	Can	48	18	12		Sliced bacon in hermetically sealed cans may develop old flavors, rancidity, and the fat may become yellow in color. Slices may show a tendency to fall apart due to breakdown of the fat.
Bacon, sliced prefried	Can	48	30	12		
Ham, chunks	Can	60	48	30		
Luncheon meat	Can	60	36	24		
Pork sausage	Can	60	36	24		
Pork and beef combinations					Temperatures above 90°F hasten deterioration	
Frankfurters	Can	60	48	30		
Luncheon meat	Can	60	36	24		
Vienna sausage	Can	48	24-30	12-18		
Poultry					Do not store above 90° F	
Chicken	Can	60	36-48	30		
Turkey	Can	60	36-48	30		
Fish						Leaky cans, swells, flippers, springers, flat sours, pinholing, or discoloration are signs of deterioration of product. Occasionally sharp glass-like crystals may be discovered in canned fish items. Invariably these crystals are a formation of a substance known as struvite which occurs in storage, and is not harmful.
Clams	Can	48	12-24	6-12		
Salmon	Can	60	30	12		
Sardines	Can	48	12-24	6-12		
Tunafish	Can	60	30	12		

8488 8487

Dairy Foods and Eggs

Most of the items listed in table 4-2 are classified as nonperishable and are packaged in rigid containers where moisture and infestation are not problems. However, items packaged in containers which are not closed to moisture, should be stored away from moisture. Observe storage temperature shown on the shipping containers. Products stored in containers which are not air tight should be given special attention. They should be stored in cool dry areas away from odorous items.

Table 4-2.—Storage Data for Dairy Foods and Eggs

48.78

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Dairy foods						
Cheese						
Cheddar, processed	Can	60	30-36	12		Deterioration indicated by blown cheese, excessive mold, oiling off, drying out, cracked cheese and off-flavor.
Grated Parmesan or Parmesan and Romano	Container		6	3		
Ice cream mixes						
Paste	Can	24	7-12	4	Do not store above 70°F	Rancid, tallow, fruity, and stale flavors, darkening, lumping, and poor solubility may occur in the mixes.
Powder	Can	24-36	12	4		
Milk and cream						
Milk						
Dry, nonfat, instantized	Can	36-60	12-24	9-12		May develop stale flavor.
Dry, nonfat, regular	Can	36-60	12-24	9-12		May develop stale flavor and caking when not adequately protected from moisture; color tends to darken. Should then be used only for baking.
Dry, whole	Can	24-36	10-12	5-6		May darken in color and develop stale flavor, rancidity or tallowness. If it becomes rancid, it may be used for baking.
Evaporated	Can	24-36	12	6	Do not store above 100°F or below 33°F	Cases should be turned every 30 to 60 days to prevent separation of butterfat, but separation and grainy sediments are not cause for condemning stock as the milk can be used for cooking purposes.

8488

Table 4-2.—Storage Data for Dairy Foods and Eggs—Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Milk product, dry cocoa flavored	Heat sealed envelope	60	24	12	High humidity	Stale flavor and caking indicate deterioration.
Cream						
Dry, coffee type	Can	60	36	8	Do not store at 100°F or above	Deterioration indicated by stale or tallow flavor.
Dry, coffee type	Envelope	48	24	6		
Dry, whipping	Can	8	6	4	Do not store above 70°F	Deterioration indicated by stale or tallow flavor.
Eggs, whole, dried, powdered	Can	60	24-36	12-18	Do not store at 90°F or above	Deterioration indicated by darkening in color, loss of solubility, mealy texture, scorched flavor and off-odor when prepared.

Fruits and Vegetables

Store canned fruits and vegetables at most favorable conditions with storage temperatures not to exceed 100°F. Storage above 100°F may cause chemical and bacterial spoilage as well as loss of color and taste. Dehydrated canned fruits and vegetables should be kept at approximately 70°F or lower. Table 4-3 lists the best possible storage conditions for canned fruits and vegetables and dehydrated fruits and vegetables packaged in foil or fiber.

Table 4-3.—Storage Data for Fruits and Vegetables

48.79.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Fruits						
Canned					Over 100° F. Lower than 25° F	Musty flavor and darkening indicate deterioration.

0028 8489

Table 4-3.—Storage Data for Fruits and Vegetables — Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Fruits						
Canned—Continued						
Berries	Can	36	6-12	2-6		
Cherries, sour	Can	36	6-12	2-6		
Citrus	Can	36	6-12	2-6		
All other canned fruit	Can	48-60	24-36	12-18	Over 100°F. Lower than 25°F.	Spoilage occuring before the termination of safe-storage periods is evidenced by ruptured, leaky, or pinholed containers, flippers, springers, or swells, or off-color, odor, or flavor. Deterioration resulting from age is indicated by softening of fruit, fading of color, loss of flavor and pinholing of highly acid products.
Dehydrated					High temperatures	
Apples, pie style	Can	36-48	7-12	3-6		Deterioration indicated by darkening.
Applesauce, instant	Can	36	24	12		Deterioration indicated by browning and caking.
Apricots	Can	24	12	5		Deterioration indicated by darkening.
Fruit cocktail mix (dessert type)	Can	24	12	5		Deterioration indicated by darkening.
Peaches, slices	Can	24	12	6		Deterioration indicated by darkening.
Prunes, pitted	Can	24	12	9		Deterioration indicated by darkening.

8490

Table 4-3.—Storage Data for Fruits and Vegetables—Continued

48.79.2

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Fruits						
Dried—Continued					High temperatures and humidities below 70%	Loss of color and palatability increase with increase of temperature. As soon as a package is opened, it is immediately subject to infestation by insects. Insect activity virtually ceases at 40°F or below. Loosely sealed containers are not moisture-proof and are not readily accessible to insects. Dried fruit is very responsive to changes in humidity, and if humidity is less than 70%, the exposed fruit will become hard and dry.
Apricots	Carton	36	2-5	1		
Currants	Carton	36	12-15	6-9		
Peaches	Carton	36	7-12	3-4		
Prunes	Can	48-60	12-24	9-15		
Prunes	Carton	36	12-15	6-9		
Raisins	Can	48-60	12-24	9-15		
Raisins	Carton	36	12-15	6-9		
Juices						
Powdered, natural						Flavor and stability depend on use. Entire contents of can must be used at once, otherwise product absorbs moisture and cakes.
Grapefruit	Can	60	36	18		
Orange	Can	60	36	12		
Single strength						
Grape	Can	24	12	6		
Apple, pineapple	Can	36	24	10		
Grapefruit, orange blended grapefruit and orange	Can	48	36	18		
Miscellaneous						
Cherries, Maraschino	Jar	36	30	12	Below 0°F	Freezing will destroy texture. Deterioration, indicated by darkening.
Vegetables					Above 100°F below 25°F	
Canned						
Sauerkraut	Can	48	18	9		

SEP 1491

Bakery and Cereal Products

Bakery and cereal products are subject to deterioration or damage from moisture, high temperatures, infestation and absorption from other products. Store these items on racks or dunnage in a moderately cool, dry place at an approximate temperature of 70°F and a relative humidity of 60 percent. Protect them from heat, moisture, vermin, and such odorous items as paint, oil, soap, and spices. The approximate keeping time of bakery and cereal products under certain conditions is listed in table 4-4.

Table 4-4.—Storage Data for Bakery and Cereal Products

48.80.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Bakery products						
Mixes						
Biscuit						
Bread and roll						Deterioration indicated by rancid odor, mold, loss of baking quality.
Cake						Deterioration indicated by rancid odor, mold, loss of baking quality.
Doughnut	Bag or carton	12	6	3		Deterioration indicated by rancid odor and mold.
Frymix breading and batter	Can	48	24	12-18		Deterioration indicated by rancid odor and mold.
Pancake						Deterioration indicated by rancid odor and mold.
Pie crust						Deterioration indicated by rancid odor and mold.
Sweet dough						
Products and ingredients						
Cornstarch	Carton	36-60	24-36	12-24		
Cookies	Carton	4-12	1-6	1 week to 3 months		Deterioration indicated by staleness, mustiness, off-odors, and flavors.
Crackers, soda and graham	Carton	4-12	1-6	1 week to 3 months		Deterioration indicated by staleness, mustiness, off-odors, and flavors.

8493

Table 4-4.—Storage Data for Bakery and Cereal Products — Continued

48.80.2

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Bakery Products						
Mixes — Continued						
Crackers, soda 12% minimum fat	Carton	36	12	6		
Tapioca	Carton	36-60	24-36	12-24	High humidity	Deterioration indicated by mustiness, insect infestation, and rodent contamination.
Wheat base	Bag	60	36	18	Above 90° F	Refrigerated storage is desirable.
Cereals						
Barley	Carton	36-60	24-36	12-24		
Cereal, quick-cooking	Carton	36	24	18		Deterioration indicated by rancidity, mustiness, infestation, and rodent contamination.
Cereal, quick-cooking	Can	36-48	24-36	18-24		
Cereal, ready-to-eat	Carton	36	12	6	Above 50% humidity	
Cereal, ready-to-eat, sugar coated	Carton	12	12	6		
Corn meal	Carton	36	24	18		
Corn meal	Can	36-48	24-36	18-24	Above 60% humidity	
Hominy grits	Carton	24-36	12	6		
Hominy, whole	Can	48	36	6		
Rice, parboiled	Bag	24	12	6		
Flour						
Rye	Bag	4-6	2-4	1-2	Above 70% humidity	Keeping times are based on a relative humidity of 60%.
Wheat, hard or soft	Bag	24	9-12	3-4	Above 70% humidity	
Wheat, hard, vacuum	Can	60	24	12-18	Above 70% humidity	
Macaroni Products						
Macaroni, spaghetti, and vermicelli	Carton	36-48	24	9		
Noodles, chow mein	Can	6	2	1		
Noodles, egg	Carton	36	24	9		

CCP 8494

Sugar, Confectionery, and Nuts

All the items in table 4-5 are subject to deterioration or damage from moisture, high humidity, and odor absorption from other products. For variances in storage requirements for individual items, see the REMARKS column in the table.

Table 4-5.—Storage Data for Sugar, Confectionery, and Nuts 48.81.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Confectionery						
Almond paste	Can	36	9	3		
Candy, caramel	Box	24-36	9-18	4-6	Above 60% RH	
Candy, coated	Can	60	30	12		
Candy, coated	Box	24-36	9-18	4-6	Above 60% RH	
Candy, hard	Can	60	24-36	12-18	Above 90°F	Deterioration indicated by loss of hardness; becomes opaque and soft.
Chewing gum	Carton	9	4	2		Deterioration indicated by brittleness, lack of flavor.
Chocolate, cooking unsweetened	Paper wrapper	24-36	6-12	3-6	Above 80°F	Do not store near other material capable of imparting odor to the chocolate. Deterioration indicated by melting, mustiness, and mold.
Chocolate, sirup beverage, stabilized	Can	60	24	12		Deterioration indicated by off-flavor and color, change in consistency.
Chocolate sirup, topping, unstabilized	Can	60	24	12-18		
Coconut, dessicated for baking	Bag	24	12	6	High humidity and temperature	Deterioration indicated by off-odor, browning. Rancid soap taste develops at high temperature.
Coconut, prepared, sweetened	Can	30-36	18-30	12	Above 100°F	Deterioration indicated by yellowing, browning, soapy taste, and mold.
Fruit, candied, cherry and pineapple	Cartons	12	6	3	High temperature	Deterioration indicated by stickiness.
Fruit, candied, mixed pieces	Can	12	6	3	High temperature	Deterioration indicated by stickiness.

Table 4-5.—Storage Data for Sugar, Confectionery, and Nuts—Continued 48.81.2

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Honey, extracted	Glass	36	24	12	Freezing temperature	Deterioration indicated by mold in crystal growth. Heating reverses crystallization.
Marshmallows	Box	36	12	6	Below 60% RH	
Sirup and molasses	Glass and can	60	18-24	10-12	Above 85°F, below 40°F	Deterioration indicated by crystallization and fermentation. Fermented product is not safe to use.
Nuts, shelled, vacuum pack	Can	60	24	12		
Sugar						
Brown	Carton	36	18	6-9	Above 90° F, below 35°F	Tends to cake.
Confectioner's	Carton	36	18	6-9	Above 90° F, below 32°F	Tends to cake.
Granulated	Bag	Indefinite	Indefinite	Indefinite		
Granulated	Can	Indefinite	Indefinite	Indefinite		

Jams, Jellies, and Preserves

Jams, jellies, and preserves listed in table 4-6 are procured in glass and metal containers and can be stored under available storage conditions. Generally, only the container will be subject to deterioration.

Soups

Soups stored at high temperatures for too long a period may deteriorate and become unacceptable. Long storage may cause some of the ingredients to form a ball or cake. When this happens it is difficult to make the soup go back to its original form. Refer to table 4-7 for the best possible storage information.

Special Dietary Foods and Food Specialty Preparations

For variance in storage requirements for individual items, see the REMARKS column in table 4-8.

Fats

Fats are subject to deterioration mainly from high storage temperatures. When you store these products, place them in cool areas where the humidity is low enough to prevent rusting of the containers. For the best results, these products should be stored at temperatures of 72°F or less. See table 4-9.

CC8 8496

Table 4-6.—Storage Data for Jams, Jellies, and Preserves

48.82

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Jams, jellies, and preserves						
Apple butter	Can or glass	36-48	12-24	10-12	Above 90°F	Deterioration indicated by carmelization, off-flavor, dark color, and crystallization. This does not render the product unsuitable for human consumption but does destroy the natural appeal.
Jams	Can or glass	48-60	18-24	10-12		
Jellies	Can or glass	48-60	18-24	10-12		
Marmalade	Glass	48-60	18-24	10-12		
Peanut butter	Can or glass	48-60	24-48	18-24		Separation of oil from peanut butter can be corrected by mixing.

Table 4-7.—Storage Data for Soups

48.83

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Soups						
Condensed	Can	36-48	12-48	6-8	Freezing temperatures	Cream-style soups break down on freezing but are not spoiled. Vegetable soup components become mushy.
Dehydrated						
Chicken noodle	Can	36-48	12-24	7-9		
Green pea	Can	60	30	12		
Onion	Can	60	24	9		
Tomato-vegetable	Can	24	12	6		Deterioration indicated by strong, hay-like aroma.
Ready-to-serve	Can	60	36	18	Freezing	Tomato spoils more rapidly than other varieties.

8497
8498

Table 4-8.—Storage Data for Dietary Foods and Food Specialty Preparations

48.84.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40°F	70°F	90°F		
Chili Con Carne	Can	48	36	24		
Dessert powder, gelatin base	Fiber cans with metal ends, cans, cartons	60	12-24	6	High temperature, high humidity	Highly susceptible to damage by moisture and will deteriorate rapidly. Once opened, will tend to lose flavor and develop turpentine odor or flavor. Opened cans should be used as soon as possible.
		36	12	6		
Dessert powder, starch base	Can	60	24-36	10-12	High temperature, high humidity	
	Carton	36	12	6		
Gelatin, plain, edible	Moisture-proof carton	48-60	24-36	18-24	High temperature, high humidity	High humidity may cause damage to cans. Product has a tendency to cake.
Malted cereal, sirup, dry	Bag and carton	24	12	9	High humidity	Deterioration indicated by sticky, fermentation odor.
Malted cereal, sirup, liquid	Can	12	3-4	1-2	Temperature above 40°F	Deterioration indicated by darkening, gas formation due to fermentation.
Meringue powder	Package	48	24	12-18	Above 70°F high humidity.	Deterioration indicated by discoloration, off-color, off-odors, loss of baking qualities.
Mincemeat	Can	36	18	9		
Popcorn, unpopped	Can	96	36	36		
Potato chips	Cellophane bags and cartons	3	1	1 week		Deterioration indicated by rancidity, off-flavor, off-odors, loss of crispness.
Potato sticks	Can	36	24	12	Above 60°F	

8498

Table 4-8.—Storage Data for Dietary Foods and Food Specialty Preparations—Continued 48.84.2

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Soup and gravy base, dehydrated	Can	48	24	12	Freezing temperature	Deterioration indicated by caking, separation of ingredients, and oxidation, off-flavors and odors. Recommend that soup and gravy base, dehydrated, chicken be stored at 40°F.

Table 4-9.—Storage Data for Fats 48.85

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Fats						
Lard	Carton	16	5	No		Lard should be stored away from direct sunlight which accelerates rancidity. Cartons afford adequate protection only when the temperature is kept below soft point (approximately 85°F).
Margarine	Can	60	24	3-12	Above 90°F	
Salad oil	Can	24	9	4-6	Above 90°F	Deterioration indicated by rancid odor, taste or change in appearance (tends to lose its clarity and brilliance). Salad oil held for a long period below 32°F will show solid materials present which are harmless and disappear on warming.
Shortening compound	Can	36-60	18-24	12-15		Deterioration indicated by rancidity, off-flavors and odors. If held above 90°F, may induce changes in texture unfavorable to the normal creaming properties of shortening.

8200
8499

Condiments and Related Products

It is recommended that condiments and related products be stored at 70°F or 40°F. The lower temperature is better. For additional information, refer to table 4-10.

Cocoa, Coffee, and Tea

When storing individual items of cocoa, coffee, and tea, see the REMARKS column of table 4-11 for variance in requirements.

Table 4-10.—Storage Data for Condiments and Related Products

48.86.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Antioxident compound, food service	Carton	Indefinite	Indefinite	Indefinite	High humidity	
Baking powder	Can	Indefinite	Indefinite	Indefinite		
Baking soda	Carton	Indefinite	Indefinite	Indefinite		
Catsup and chili sauce	Can	24-36	12	6		Deterioration indicated by blackening, raw pungent odor. Excessive long storage will result in pinholing of cans.
Cream of tartar	Carton	Indefinite	Indefinite	Indefinite		
Flavoring, imitation maple, vanilla	Glass	Indefinite	Indefinite	Indefinite	Store away from light	Deterioration indicated by loss of flavor and color and settling of material at bottom of bottle.
Flavoring, nonalcoholic, lemon, orange	Glass	24	18	6-9	Store away from light	Deterioration indicated by sharp off-flavor
Flavoring tablets, imitation vanilla, and maple	Carton	Indefinite	Indefinite	Indefinite	Above 80% relative humidity	Deterioration indicated by stickiness, gumminess evidence of mold and yeast growth.
Food coloring	Glass or can	Indefinite	Indefinite	Indefinite	Light	Tends to fade and lose strength.

Table 4-10.—Storage Data for Condiments and Related Products—Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Garlic, dry, bulb	Carton	6-12	3-4	1		
Horseradish, dehydrated	Glass	36	24	6		Deterioration indicated by loss of flavor, lack of pungency.
Mayonnaise	Can	24	6	3	Above 90° F, below 35°F	Deterioration indicated by swollen cans.
Mineral yeast food	Bag or carton	Indefinite	Indefinite	Indefinite		
Monosodium glutamate	Can	Indefinite	Indefinite	Indefinite	High humidity	Deterioration indicated by caking and absorbed odors. Not recommended for export or underway replenishment.
	Fiberboard container	Indefinite	Indefinite	Indefinite	High humidity	
Mustard, prepared	Can and jar	24-36	18	12	Above 90° F, exposure to light	Deterioration indicated by gas bubbles in cans and offensive sulphur-like odor. Brown surface indicates oxidation which can be removed and the remainder is edible. If off-odors are present, the product should be discarded.
Olives, pickles, and relishes	Can	24	12	6-9	Alternate freezing and thawing	Deterioration indicated by mushy texture, pinholing, leakage, discoloration, and off-odors
Olives, pickles, and relishes	Glass	36	24-30	9-15		
Salad dressing	Glass or can	24	6	3	High temperature	Deterioration indicated by swollen cans, gas pockets. Do not freeze.
Salt, celery, garlic, onion	Shaker containers	60	36	6-12	Above 90° F	If unsealed, storage life at 100°F is limited to six months. Deterioration indicated by softening, caking.

8501

Table 4-10.—Storage Data for Condiments and Related Products—Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Salt, table	Cloth or paper bag	Indefinite	Indefinite	Indefinite	High humidity	Relative humidity above 80% will cause caking unless package is moisture resistant. Caked salt is still usable.
Sauces, hot, kitchen, meat, soy and worcestershire	Glass	36-48	24	12	Freezing temperature. Long exposure to light will cause color changes	Deterioration indicated by off-odors and flavors. Excessive separation of ingredients or curdiness.
Spices and herbs	Fiberboard container and can	48-60	24	6-9	Above 100°F. Excessive heat or moisture; prolonged exposure to air	At temperatures above 100°F there is a complete loss of flavor in less than 6 months. Whole spices retain their strength longer than ground spices. Keep containers tightly closed when not in use.
Vinegar, cider	Glass	36-48	24-30	12-18	Below 32°F	Strained-out vinegar which contained eel, mother, or fruit fly at time of delivery is suitable for use but should be used as soon as possible.
Vinegar, dry, synthetic	Flexible package	24	12	6	High humidity	Deterioration indicated by vinegar odor outside container; caking.
Yeast, active, dry	Can	8	6-8	2-3		High temperature and moisture activate the yeast cells. This item also is listed in perishable subsistence storage table as chill storage is most desirable if available.

1028 8502

Table 4-11.—Storage Data for Cocoa, Coffee, and Tea

48.87

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Cocoa	Can	48-60	24	18	Humidity above 60%	Will absorb off-odors and flavors. Open cans may become infested with insects and should be carefully checked before using. Cocoa stored at high temperature becomes gray or white on top. This is known as blooming and is harmless.
Coffee						
Instant, powdered	Can or glass	60	36	24		The approximate keeping time applies when the product is stored below 85% relative humidity or is packaged in sealed cans. If left in uncovered container, this product absorbs moisture, cakes, and is less soluble.
Roasted, ground	Can	12-18	7-12	5-6	Dampness, high temperature	Deteriorates rapidly after opening. Should be used promptly.
Tea						
Individual bags	Can or carton	36-48	12-18	12		Do not store tea packed in cartons below 50% or above 80% humidity, especially at temperature above 90°F.
Loose	Can	36-48	12-18	12	Above 75% humidity and high temperature	Absorbs strong odors if stored in open containers. Loses volatility if stored at high temperatures.

Beverages

It is recommended that liquid and powdered beverage bases be stored at 70°F or 40°F. THE LOWER TEMPERATURE IS PREFERABLE. Deterioration by loss of flavor results when these products are stored for a long time at a high temperature. See table 4-12.

Composite Food Packages

Composite food packages are designed to give their contents maximum protection against their contents maximum protection against the hazards of storage and transit. Moisture and high temperatures may cause gradual deterioration or more immediate damage. Vermin may infest the

8503

packages, fouling and destroying the contents. Store these products in a cool dry place at a temperature of 70°F and a relative humidity of 50 percent. For detailed information regarding deterioration, see the REMARKS column on table 4-13.

Table 4-12.—Storage Data for Beverages, Liquid and Powdered 48.88

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Beverages, non-alcoholic						
Beverage base Liquid (Type II)	Glass	36-60	9	6		Deterioration indicated by loss of flavor.
Powder	Can	60	24	12		Deterioration indicated by loss of flavor. Will cake if cans are opened for any length of time.
Cocoa beverage powder	Can	60	24	12	Dampness	Deterioration indicated by caking
Water, drinking	Can	Indefinite	Indefinite	Indefinite	Above 90°F	

Table 4-13.—Storage Data for Composite Food Packages 48.89.1

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Food Packet						
Abandon ship, individual	Carton	60	36-48	18-24	Above 120° F	Designed for use in survival at sea; is stored on all types of life saving craft; carried aboard ship. The components, jelly bars, sugar, tablets, chewing gum, and matches are packed in a waterproof bag. Cigaretts are also part of this ration. It is designed to withstand extreme temperature changes. Deterioration indicated by hardening and loss of color and flavor in starch jelly bars.

8504

Table 4-13.—Storage Data for Composite Food Packages—Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Food Packet—Continued						
In flight, individual	Packet	60	24	12	Above 90° F	Designed to be eaten cold; however, it is more acceptable when some of the components are heated. Ten different menus are assembled in the different packets. The meal consists of 4 cans containing meat, fruit, bread, and dessert. An accessory packet which provides soluble beverage, sugar, chewing gum, can opener, etc. Deterioration indicated by swollen can, off-flavors and odors and caking of coffee and tea, separation of fat in candy.
Life raft, aircraft, individual	Packet	60	48	24		A tablet packet for use of survivors in emergencies involving Navy aircraft. It is stored aboard life rafts on the aircraft. Sucrose tablets of varying flavors, vitamin tablets, and candy-coated gum in a waterproof bag with a length of twine and instruction sheet are sealed in a small key-opening oblong can resembling a sardine can. The packet is designed for use when the supply of water may be critically limited.
Survival, arctic, individual	Packet	60	24	12	Above 90° F	A packet designed for survival kits carried aboard aircraft operating over arctic regions; packaged in flat, rectangular cans for ease in carrying; consists of a variety of concentrated

Table 4-13.—Storage Data for Composite Food Packages—Continued

Product	Packaging	Months-approximate keeping time			Dangerous storage conditions	Remarks
		40° F	70° F	90° F		
Food Packet						
Survival, arctic, individual—Continued						and compressed food bars including cereal, chocolate, jelly, fruitcake, and cheese along with accessory items. Designed for use with a minimum of water; is not thirst provoking. Deterioration indicated by off-odors and flavor (rancidity); caking of soluble coffee, tea or cream beverages.
Combat Meals						
Meal, combat, individual	Can and packets	60	24	12	Above 90° F	Designed for use either in individual units as a meal packet, or in multiples of 3 as a complete ration. Twelve meal cartons and 2 accessory cartons (each holding 2 accessory packets) are packed in each container. Packaged by individual meal, offering a variety of canned meat, fish or poultry, canned vegetable, canned fruits, desserts, beverage. Deterioration indicated by rancidity and caking of soluble beverages. Small holes in flexible packages indicate insect infestation. For long storage, keep in cool place.
Ration, survival, individual	Can	60	49	36		Designed to be eaten cold; but consists mainly of meat and cereal-type food bars, fruitcake bars, and soluble beverages. Seasonings are included to provide flavoring. Having good stability, it lends itself well to emergencies. It is necessary that adequate water be consumed with this ration.

8506

RATION-DENSE FOODS

Concentrated, prefabricated, and dehydrated foods are described as RATION-DENSE. They are compact to stow and increase a ship's cruising endurance. The supply officer sees to it that all authorized ration-dense foods are stocked regularly.

Ration-dense foods eliminate waste, reduce bulk, and where possible, eliminate the need for refrigerated storage.

For comparison, examples of six standard and six space-saving food items for 100 men for 30 days are given below:

High-Use Standard	Space-Saving
Bacon, smoked, slab	Bacon, prefried, canned
Coffee, R and G	Coffee, instant
Eggs, fresh, shell	Eggs, dried, whole
Milk, fresh, whole	Milk, dry, nonfat
Onions, fresh	Onions, sliced, dehydrated
Potatoes, fresh	Potatoes, diced, dehydrated
Total Weight 3332 lbs	Total Weight 531.75 lbs
Total Space 220.5 cu ft	Total Space 33.9 cu ft

From the information above, and from figure 4-1, you can readily see that ration-dense foods save storage space, do not require refrigeration, and are convenient to use.

FRESH AND FROZEN SUBSISTENCE ITEMS

Fresh and frozen subsistence items include dairy products, eggs, fish, fruits, meat and meat products, poultry, and vegetables. The following paragraphs will give you a general idea of how to prevent deterioration of these types of subsistence.

Figure 4-1.—Ration-dense foods are space savers.

48.6

8507

8028

Prevention of Deterioration

All fresh and frozen subsistence items are highly perishable and subject to rapid deterioration when improperly stored. They require temperatures that are neither too high nor too low, favorable conditions of humidity and of air circulation, and special care in keeping the storage space sanitary. Failure to maintain any one of these conditions will result in rapid spoilage and eventual loss. Most spoilage in fresh and frozen subsistence is caused by micro-organisms, particularly certain species of bacteria and fungi; the infection spreads rapidly from the decayed items to the surrounding sound subsistence.

As a Commissaryman, you may be assigned as the cold storage man. When such is the case, your duties regarding storage and care of fresh and frozen subsistence items are as follows:

1. Making frequent inspections in storage, sorting and removing any decayed items or portions. This will keep the items in top condition and will keep losses and surveys to a minimum.
2. Segregating and marking shipments to make clear their relative ages. This facilitates issue of the oldest first unless there is some reason in the condition of a newer lot for giving it priority.
3. Preventing the accumulation of old lots of fresh and frozen subsistence items in the storage rooms. Issue them promptly or recommend for survey those items which are not fit for human consumption.
4. Except as otherwise indicated in chapter 3, refusing to accept frozen products that have thawed even a little. After items have been defrosted do NOT refreeze.

Fresh Fruits and Vegetables

When storing fresh fruits and vegetables, raise the containers off the deck with pallets, and stack individual lots in such a way as to permit free circulation of air. Also, stack the containers properly—put the pressure on the container, not on the contents (fig. 4-2). In some cases it may be desirable to maintain proper circulation in all parts of the room by a fan, perhaps with a duct system. Make certain that the room is safe for work. When fresh fruits and vegetables are stored in a tight compartment at temperatures of 40°F or higher, the concentration of carbon dioxide produced by respiration may reach such a danger point that it is unsafe for work. One good way to check the amount of carbon dioxide present in a room is to light a match or a candle. If the light is extinguished do not work in the room until fresh air has been introduced.

Meat, Meat Products, and Poultry

Proper circulation of air is the prime factor in keeping the desired temperature in all parts of the meat storage space. Do not store meat on the deck; place pallets on the deck to allow free circulation of air under all items stored in the space. Generally, when the recommended temperature in all parts of the refrigerated space is uniform and is maintained within the stacks in the freezer space, the circulation of air is considered adequate.

Dairy Products and Eggs

Keep the cold storage room for dairy products and eggs fresh by keeping it clean and by circulating the air slowly. Air circulation can be provided by the use of pallets on the floor, and by proper stacking of the various lots.

Figure 4-2.—Storage of fresh produce.

8508

Frozen Fruits and Vegetables

Frozen fruits and vegetables are highly perishable unless properly stored. Upon delivery, they must be transferred promptly to a low temperature storage space. Check the temperature of the load upon arrival, by taking temperature readings of cartons selected from top layers inside of shipping cases.

When the temperature is found to be higher than that of the freezer room, scatter the shipping cases loosely about the room on handtrucks or on the deck with adequate space between individual cases to permit rapid lowering of the product temperature to freezer room temperature. Use of a portable fan to create an air current over the item will speed up temperature equalization. When the temperature of the item has been lowered sufficiently, stack the cases compactly. If the item temperature upon delivery is the same as or below the temperature of the freezer room, cases should be stacked compactly at once. Stack from the bulkhead toward the center of the room, starting about 4 inches from the bulkhead or bulkhead coils. Stack the cases on pallets to permit circulation of air under them. Using pallets will keep the cases more sanitary. In rooms where cold air is expelled directly from blower units at the ends of the rooms, stack the cases low enough to permit air circulation. Allow at least 2 feet between the top of the stack and the overhead or air ducts.

REFRIGERATED STORAGE OF PERISHABLE SUBSISTENCE

Table 4-14 is for your guidance, afloat and ashore, in computing the maximum recommended storage periods for fresh and frozen subsistence under various storage or holding temperatures. The table lists temperatures and humidities which are considered to be the most favorable. The storage periods are based on the assumption that the products have been processed and procured in accordance with current specifications and delivered in good condition.

The information listed in table 4-14, when used intelligently, will provide adequate refrigerated storage information about the product named. Actually, it is a general guide and requires common sense application. The "approximate" storage life is just that—APPROXIMATE. There are exceptions to this list. Date of pack (season) or date of oldest inspection stamp on the product, as well as date of receipt must be used to compute the terminal date of the maximum possible storage period.

REFRIGERATION COILS AND UNITS

Three factors affect the rate at which frost and ice accumulate on refrigerator coils: (1) door traffic; (2) excessive temperature difference between the coils and the box; and (3) moisture from the stowed materials. In each case the build-up can be reduced by planning and care. Measures discussed in the following paragraphs may be used to prevent excessive icing of coils.

Door Traffic

Breakouts should be planned for a full day's requirements. All messes should draw their frozen subsistence items at a predetermined time, usually in the morning. Any items withdrawn at this single daily breakout from the freeze box, if not intended for immediate use, should be stowed temporarily in the chill box.

This "one breakout" per day should be strictly enforced. With a little planning on the part of the various messes, it should not be too difficult. In this way, the reefer temperature will remain constant and excessive icing from too much door traffic will be kept at the minimum.

Temperature Controls

Difference in the temperature of the refrigerated spaces and the coils will cause vapors that will ice the coil rapidly until the temperatures coincide.

The temperatures are likely to differ most during the period when the freeze box is being restowed. Higher temperature of the subsistence items being stowed will cause a rise in temperature in the refrigerated space and produce vapors. Vapors are also caused by the admittance of warm outside air into the reefers when the door is open. There is no way to prevent this condition, since the work of stowing must go on. However, once the stowage has been completed, the box should remain closed until the normal temperature level has been reached.

Air-Circulation

Moisture, humidity, and vapors which cause icing under conditions other than those cited above are usually the result of improper circulation of air within the box, or more generally are the result of improper stowage. Continuous circulation by electric blowers is necessary at all times. Stowage arrangements should be such as to allow free circulation of air throughout the box.
